INDEX.

A

Accidental Obstructions on Highways, 179
Accidents from Falling Trees, 484, 505
Activated Sludge Process of Sewage Disposal, 6, 144, 297, 298, 359, 370, 544 546
After-War Problems, 1
Agricultural Machinery, Control of, 64
Allotments, Tenure of, 348
Allowances to Officials on Service, 284
America, Municipal Engineering in, 555
American Roads, 180
An Anglesey Sea Wall, 119
Ancient Monuments, 128
Animals on the Highway, 27
Annual Reports:—
Bulawayo, 88
Cape Town, 186
Gloucestershire, 492
Herefordshire, 590
Shanghai, 447
Staffordshire, 495
Apathetic Irish Councils, 61
Ashbins and Public Health, 247
Assistant County Surveyors, Irish, 453
Association of Consulting Engineers, 561
Atmospheric Pollution, 504, 511

B

Belfast Electricity Undertaking, 272
Belfast Ferro-Concrete Outlet Sewer, 138
Binnie, Death of Sir Alexander, 491
Birmingham Public Works Department, 21
Bognor Coal Dues, 296
Bognor Drainage Contract, 443
Brighton, Electric Vehicles at, 160
Bristol, Insanitary Property at, 3
Brushwood Sewage Filters, 4, 254, 458, 575
Building Board, 391
Building By-laws, 157, 186, 195, 241
Building Licences, 540
Building Materials and Fuel Economy, 165
Bulawayo, Municipal Work in, 83
Bundling Press, 123
Burst Water Mains, 26, 29

C

Calorific Value and Possibilities of House Refuse, 553, 557, 572
Canals Control, 431
Candidates for Commissions, Travelling Expenses of, 565
Cape Town Municipal Work, 186
Cardiff Reservoir Contract, 511
Cast-iron Pipes, Standardisation of, 603
Catskill Mountains, Water Scheme, 28
Cement Joints for Cast-iron Water Mains, 390, 412
Centre-Channel Roads, 487
Centrifugal Pumps *v.* Pneumatic Ejectors for Sewage Pumping, 141, 164
Chimney, World's Highest, 473
Chinese Dwellings, 490
Cineris: A Plea for Sanitary Reform, 454
Cleator Moor Surveyor's Salary, 367
Coal Concreted from Ashes or Dust, 527
Coal Distribution, Local Authorities and, 473, 519, 595
Coal from Coke Breeze, 356
Coast Erosion in Ireland, 276
Collection and Disposal of House Refuse, 448
Comparative Reports of General Practice:—
Cemetery Charges in the Metropolis, 345
Motor Traction for Municipal Purposes, 233
Concrete, A Method of Proportioning Materials for, 444, 446
Concrete and Reinforced Concrete as Substitutes for Timber, 344
Concrete, Effect of Excess Water in, 419
Concrete in Cold Weather, Protection of, 94
Concrete Institute:—
Meetings, 123, 446
Concrete Roads, 228, 280, 469
Concrete Roads, Specifications for, 236
Concrete, Specifications for, 91
Conferences, Representation at, 499
"Consulting Engineers," 483
Consulting Engineers and the War, 561
Contractors' War-time Difficulties, Road, 315
Contracts Legislation, War, 243
Control of Roadstone Quarries, 456, 505
Coolgardie Water Supply, 362, 379
Correspondence:—
Adshead, Professor, and "Local Surveyors," 143
After-the-War Trade: Overseas Industrial Exhibitions, 143
Air-raids and Housing, 574
Alibi, An, 327
Blasting, Quicklime for, 514, 535
Building By-laws, 195, 241
Building Materials and Fuel Economy, 165
"Carrying On" with Depleted Staffs, 575
Cement Joints for Cast-iron Water Mains, 412
Chlorination of Water, 574
Civic Survey of South-East Lancashire, The, 164
Coinage Decimalisation Bill, 214
Concrete Roads, 280
Consulting Engineers, Government and, 598
Conversion of Refuse into Fuel, 310
Cottage Design, Surveyors and, 47
Cremation and Premature Burial, 241
Decimal Currency, 455
Decimal Weights, Measures, and Coinage, 140, 165, 195, 411, 436, 472, 474
Foreign Languages, Engineers and, 392, 435
France, Road Service in, 9
Good Roads, The Importance of, 280
Goods Clearing-House System, The, 494
Housing and Town Planning After the War, 9
Interconnecting Electricity Supply Undertakings, 279
Ireland, Testing Facilities in, 164
Irish Congress, The Suggested, 215
Junior Institution of Engineers and Engineering Students, 3, 10
Light Railways, 455
Light Railways for the Roads, 436
"Looking Ahead," 514
Men on Service, For the, 369
Metric System, the, 61
Motor Omnibuses, The Weight of, 411
New Inventions, 494
Organisers' Clearing-House, An, 143
Pigsties, their Erection and Control, 117
Rainfall, 598
Refuse Destructor Clinker in Road Making 369
Refuse Destructor Costs, 473
Refuse Tips, Land for, 473
Reservoirs, The Design and Cost of, 9, 60, 118, 142
Road Service in France, 9
Correspondence *(continued)*:—
Rooks, The Destruction of, 514
Rule of the Road in England, 144
Salaries, 412
Scavenging, 310, 344
Sewage Disposal, Chemical Knowledge in, 494
Sewage Filters, Brushwood as a Medium for, 575
Sewage Pumping: Centrifugal Pumps *v.* Pneumatic Ejectors, 141, 164
Sewermen, The Safety of, 514
Sewers, Sizes of, 165
South-east Lancashire, Civic Survey of, 164, 194, 241, 257, 310, 327
Studs on Road Locomotive Wheels Use of, 279, 240, 327
Surveyors and Cottage Design, 47
Testing Facilities in Ireland, 164, 281
Timber Haulage, Damage to Roads by, 535, 554
Vent-shafts on Private House Drains 214, 257, 280
Waste Materials, Utilisation of, 344
West Country Appointment, A, 554
Wheel Tax, The Proposed, 280
Worcester Activated Sludge Experiment, The, 144
Workmen's Wages, 344
Cottage Conversion in Rural Districts, 393
Councillors and Officials' Travelling Expenses, 339
Country Roads Board of Victoria, 136
Cracks in Concrete Roads, Causes of, 216
Cremation and Premature Burial, 241
Crystal Palace Engineering Society, 410
Cultivation of Lands Order, 1916, 260, 282, 308, 324, 339, 347, 420
Cultivation of Roadside Wastes, 160
"Cuteline," 255

D

Dam Construction, Earthwork, 2
Decay in Timber, 568
Decimal Weights, Measures and Coinage, 92, 140, 165, 195, 214, 215, 340, 388, 411, 415, 436, 450, 455, 472
Demolition Orders, 485
Depreciation of Plant, Principles Involved in the, 127, 132, 161
Diffusion of Sewage in Water, 190
Doncaster, Tramway Foundation Renewals at, 437
"Don'ts" for Householders, 513
Dublin Municipal Workshops, 167
Dublin Workshops, 26
Dundee Housing Schemes, 363, 575
Dustbins of Greater London, 429, 432
Dutch-Oven Refuse Incinerator, 185
Duties of a Surveyor, 342, 351

E

Earthwork Dam Construction, 2
Economy in Water Treatment, 251
Edinburgh Tramways, 186
Education of the Engineer, 441
Egypt, Local Government in, 563
Electing a Borough Surveyor in Ireland, 160
Electricity in Agricultural Areas, Development of, 300
Electricity in Agriculture, 584
Electricity in Municipal Engineering, Uses of, 36, 42

Electricity Supply: Departmental Committee, 309, 499, 552, 590
Electricity Supply, Future of, 570
Electric Vehicles in the Far East, 456
Engineering Standards, 465
Engineers and Foreign Languages, 359, 392, 455
Essex Water Supplies, 372
Excessive Weights on Highways, 583, 586
Experiences in a Fen Rural District, 382, 410
Experiences in Water Filtration, 49, 57
Extraordinary Traffic: Time for Proceedings, 127

F

Failures of Bituminous Surfaces, 474
Falling Trees, Accidents from, 484, 505
Farmer Councillors and Road Work, 88
Fence Walls on Main Roads, 51
Fen Rural District, Experiences in a, 382, 410
Ferro-concrete Bridges on the Meuse, 89
Ferro-concrete Bridge Tests, High Wycombe, 242
Ferro-concrete, Government and, 323
Ferro-concrete in Swimming Bath Construction, 230
Fire Hydrants, Testing of, 346
Fires and Wide Streets, 213
Flash Lamps Without Batteries, 42
Fly Extermination, 493
Fly Nuisance, Dustbins and the, 445
Fly Nuisance in South Africa, 62
Food Waste: Local Authorities' Powers, 456
Fog and Gas Consumption, 13
Footpaths, Repair of, 504
Foreign Languages, Engineers and, 359, 392, 455
Foreshore Sand Accumulation, 385
Forestry, Organisation of, 25
France, Road Service in, 9, 157, 505
Freezing of Water Mains and Services, 193
Fuel, An Important Economy in, 316, 333
Furniture Storage, Local Authorities and, 163

G

Gas, Testing of, 569
Geology and Engineering, 544
Germans and British War Roads, 401
Glasgow Corporation and Cottage Homes, 156
Glasgow's New Baths, 261
Glasgow's Successful Tramways, 228
Goods Clearing House System, 445, 494
Grimsby Team Labour Costs, 183

H

Halifax, Control of Street Cleaning at, 272, 274
Harpur, Death of Mr. Wm., 516
Harrow, War-time Efficiency at, 366
Herefordshire Roads, 590
Heston and Isleworth Municipal Works, 350
Highest Earth Dam, 286
Highway Cases, 271
Highways and Byways, 203, 211, 234, 263
High Wycombe Ferro-Concrete Bridge Tests, 242
Hipperholme Paving Setts Controversy, 278
Home-grown Timber, 273
Hot Water Supply, 460
Housing and Town Planning:—
Air Raids and Housing, 574
Birmingham, 117
Birmingham Conference, 326
Chinese Dwellings, 490
Civic Survey of South-East Lancashire, 164, 194, 241, 257, 310, 327
Cottage Conversion in Rural Districts, 396
Dublin New Town Plan, 46
Dundee Housing Schemes, 363, 575
Glasgow Corporation and Cottage Homes, 156
Housing and Town Planning *(continued)*:—
Greater London Plan, 291
Housing after the War, 379, 383
Housing Designs, 499
Housing of Munition Workers, 159, 372
Huddersfield, 229
India, 320, 330
Irish Housing Needs, 453
London as it Ought to Be, 157
Monumental Memorials and Town Planning, 184
Municipal Engineers and Town Planning, 524
Municipal Housing, 304
Municipalities and Housing, 59
Neath, 237
Newcastle-on-Tyne Conference, 287
Oxford Conference, 379, 383
Port of London Houses, 540
Preliminary Town Planning Schemes, 420
Private Enterprise, 500
Progress of Town Planning in Scotland, 526
Property Owners and Repairs, 535
Rural Housing 25, 444
Scarcity of Small Houses, 329
Scottish Housing Council, 261
Scottish L.G.B. Report, 470
State Assistance for Housing, 545
State Expenditure on Housing, 108
Surveyors and Cottage Design, 47, 118, 143
Town Planning Act Amendments, 499
Town Planning of Greater London after the War, 11
How the L.G.B. Pays, 218
Humorous Side of Sewage Disposal, 381

I

Importance of Good Roads, 280
Importance of Water Economy, 465
Improvisation at Sheffield, 272
Incorporated Municipal Electrical Association, 576, 570, 584
India, Town Planning in Southern, 320 330
Individual Interest in Municipal Enterprise, 563, 566
Industrial Research, 50
Influence of Roads in Macedonia, 380
Inland Water Transport, 352
Insanitary Property at Bristol, 3
Interest on Local Loans, Rates of, 326
Institution of Civil Engineers:—
Annual Report, 445
Awards for Papers, 411
Election of Officers, 411
Presidential Address, 158
Institution of Junior Engineers, 585
Institution of Municipal and County Engineers:—
Annual Meeting at Hastings, 591
Annual Report, 594
Associate Members on Council, 209
East Midland District Meeting, 389
Elections of Officers, 389, 471
Hounslow Meeting, 350, 353
Irish Meetings, 61, 215
Metropolitan District Meeting, 429, 432
Neath Meeting, 237
Orphan Fund, 205, 209, 594
Presidential Address, 591
South-Eastern District Meeting, 209
Spenborough Meeting, 237, 351
Worcester Meeting, 547
Institution of Municipal Engineers:—
Annual Meeting, 30, 34, 36, 39, 45, 54
Annual Report, 39
London Meeting, 553
Peterborough Meeting, 382, 410
Presidential Address, 30
Institution of Sanitary Engineers:—
Presidential Address, 7, 28
Institution of Water Engineers:—
Summer Meeting in London, 595
Inventions, New, 494, 505
Ireland, Extraordinary Traffic in, 281
Ireland, Testing Facilities in, 164, 281
Irish Housing Needs, 453
Irish Municipal Undertaking and Borrowing Powers, 545
Irish Sanitation, 168
Ironies of National Service, 165

J

Junior Institution of Engineers and Engineering Students, 310

K

Killarney Rural District, Water Supply in the, 533

L

Land Fertilisers from House Refuse, 103
Law Notes:—
Abatement of Nuisances, 361
Accidents from Falling Trees, 484
Bognor Drainage Contract, 443
Contracts During the War, 253, 341, 349
Demolition Orders, 488
"Domestic Purposes," 445
Drainage Contract: Alleged Misrepresentation Regarding Nature of Subsoil, 332
Extraordinary Traffic and Road Repair, 543
Extraordinary Traffic: Ireland, 281
Highway Encroachments, 564
Highway: Fallen Tree: Damage to Passenger: Liability, 192
Housing and Town Planning Act, 1909: Demolition Orders: Undertaking to Repair, 475
Land Adjoining Highway: Removal of Fence: Claim for Damages: Alleged Trespass by Highway Authority, 556
Porthcawl Esplanade, 295
Resewering of Private Streets, 319
Restricted Street Lighting: Accident, 319
Street Accident: Action Against Corporation, 243
Surface Water Drainage: Flooding, 373
Water Supply: Public Health (Water) Act, 1878, Sec. 6, 373
Law Queries and Replies:—
Adoption of Private Streets, The, 116
Building By-laws: Air Space, 192
Building Line: Public Health (Buildings in Streets) Act, 1888, Sec. 3, 145, 515
Cesspools, The Cleansing of: Water Supply, 499
Cesspools, The Emptying of, 145
Contract with Urban District Council, 556
Conversion of Privies into Water-Closets: Section 36 Public Health Act, 1875, 285
Extraordinary Traffic, 116, 145, 515
Footpath Crossing Stream: Flooding, 116
Greensward Adjoining Public Road, 515
Highway: Damage to Gas Main: Explosion, 332
Highway: Damage to Orderly Bin by Motor-car, 192
Highway: Gates and Stiles, 499
Highway: Licence to Dig for Materials for Repair: Costs, 285
Highway: Materials for Repair: Quarry, 373
Highway: Public Footpath: Subsidence: Repair, 116.
Housing, Town Planning, &c., Act, 1909, and Building By-laws, 145
Municipal Tramway: Accident to Passengers, Liability, 475
New Street: Cul-de-Sac: Gates, 475
Nuisance, 333
Nuisance: Overcrowding, 285
Officials, Compensation to, on Alteration of Area, 556
Opening Road for Laying Drains, 435
Private Street Works, 285
Private Street Works: Apportionment, 116
Private Street Works: Crown Property, 435
Private Street Works: Frontager's Liability Disputed After Final Apportionment, 285

Law Queries and Replies *(continued)*:—
Repair of Footpath, 475
Resewering of Private Streets, 332
Rural District Councillor: Appointment as Surveyor, 192
Sewer Construction: Compensation to Land Owner, 515
Sewering of New Streets, 515
Subsiding Banks and Trees Across Highways in Rural Districts, 192
Surveyor to Local Authority: Effect of Bankruptcy, 333
Timber and Stone Hauling on the Highways, 475
Urban District Councillor, Disqualification of, 515
Water Supply: Entry on Premises, 332, 373
Legal Precedents of 1916 in Relation to Municipal Engineering, 106
Legislation of 1916 in Relation to Municipal Engineering, 109
Lighting in the Metropolis, Street, 236
Light Railways for the Roads, 387, 436, 455
Linking-up Electricity Supplies, 252, 279
Literature of Municipal Engineering in 1916, 114
Llangollen Urban Councillors and the Medical Officer, 360
Local Authorities and Coal Distribution, 357
Local Authorities and Furniture Storage, 163
Local Authorities and the War Loan, 155
Local Loans and Sinking Funds, 385
Local Loans, Rates of Interest on, 326
London as it Ought to Be, 157
London County Council Tramways Reorganisation, 204, 208
London Main Drainage System, 158

Mr. EDWARD WHITWELL, F.I.S.E., M.S.A. (Lieut. R.N.V.R.),

Engineer, Surveyor and Architect, Abersychan Urban District Council,

President of the Institution of Municipal Engineers, 1917.

The Surveyor

And Municipal and County Engineer.

Vol. LI. JANUARY 5, 1917. No. 1,303.

Minutes of Proceedings.

After-war Problems.

In appointing a committee to consider the problems likely to arise at the termination of the war, the council of the Surveyors' Institution showed an entirely praiseworthy readiness to render available in the national interest the special knowledge possessed by surveyors, as distinct from other professional men or from representatives of trade and industry. The general subject of the committee's reference divided itself naturally into two branches—urban and rural—a division which is clearly recognised in the very valuable reports which have just been published. Broadly speaking, the urban report deals with the steps which should be taken to meet the possibility of a period of acute unemployment after the war, and recommends the preparation of schemes for that purpose. In preparing the rural report, on the other hand, the committee were at once forced by the difficulty that agriculture, the principal industry concerned, does not lend itself to emergency measures. The recommendations under this head are therefore chiefly designed to secure prosperity to agriculture and the employment of more persons in that industry, rather than to meet any immediate emergency of unemployment. In considering the urban problem, the committee accepted at the outset four main principles—namely, (1) that the expenditure in respect of labour should form a considerable proportion of the total outlay; (2) that the work when completed should meet a well-recognised public need, and should partake as little as possible of the nature of unproductive relief works; (3) that the scheme should be capable of being definitely organised beforehand, and should be at once prepared, ready to be put into operation immediately on the emergency arising; (4) that the scheme should be so far as possible self-supporting. It is not surprising, in view of the adoption of these principles, that the primary method suggested by the committee for providing employment is the erection of new buildings—primarily, houses for the working classes. It is, of course, matter of common knowledge that there is at the present time a very acute shortage of housing accommodation, and that the position is steadily growing worse. The problem is one which on its merits calls for the most vigorous action immediately after the war, and if special works are to be undertaken for the relief of unemployment, none can be more appropriate than house building. Work of this character certainly complies with the first three of the principles laid down by the committee, while as regards the fourth, the committee point out that if, as appears to be the case, housing schemes will not be self-supporting, any adverse balance should be borne by the national exchequer as the contribution of the Government, which would be relieved from the necessity of keeping a large number of men with the Colours. Upon a careful consideration of the whole situation the committee were led to the conclusion that it can only be in the direction of public authorities undertaking responsibility for the housing schemes needed to meet the anticipated unemployment that a solution of the problem can successfully be sought. This conclusion is very significant, for it appears from the report that, as a matter of principle, the committee were unanimously of opinion that in the future, as in the past, the provision of houses would best be left to private enterprise, provided that that source of supply did not fail.

The report is a reasoned document, and, coming as it does from a body of experts, it is earnestly to be hoped that the recommendations which it contains will receive the consideration from the Government which they undoubtedly deserve. The main recommendation in regard to housing is that, in view of (*a*) the need of being prepared for a possible period of acute unemployment after the termination of the war, (*b*) the admitted shortage of working-class dwellings, and (*c*) the practical impossibility in existing circumstances of attracting private capital to that form of investment, the Government should request the councils of counties and county boroughs to arrange beforehand for the preparation of schemes for providing houses for the working classes with approximate estimates of cost, to be put into operation at once on unemployment being found to exist. As regards finance, it is recommended that the

necessary funds be provided by the Treasury on terms not less favourable than those on which they were prepared to make advances under the Housing (No. 2) Act, 1914, and further, that the rents to be charged be not less than those ruling in the neighbourhood for similar accommodation.

Earthwork Dam Construction.

Apparently the engineers of the Kachelus reservoir, on the Yakima river in Washington, have had rather a nasty job before them, and the manner in which they are dealing with it is described in the *Engineering Record* of New York by Mr. C. E. Crowneyer. The dam consists of a bank, and a core wall and puddled clay. The core wall for its entire length is founded on gravelly clay, which is said to be "practically impervious." The word "practically" in this connection at once suggests possibilities of trouble, but worse follows. At a depth of 6 ft. below the bottom of the core wall, test holes disclosed a fine sand under much pressure—presumably water pressure. This sand formation is of considerable depth, and test holes were driven for a depth of 35 ft. without passing through. This sand is therefore considered too deep to pass through with a cut-off wall, and the concrete core wall was therefore founded on the overlying clay.

This method of construction gives the English engineer a very uncomfortable feeling, and suggests possibilities with which anyone who has had to deal with water pressure and running sand, and structures founded on material overlying running sand, will be familiar. It seems that the engineers are of opinion that there is no connection between the water in the lake above the dam and the stratum of fine sand, owing to a difference in the water levels. A number of drill holes were made on the line of the conduit through the dam, and no relation seemed to exist between the water level in these holes and the water level in the lake. Further, it appeared that the lake bottom was covered with from 5 ft. to 20 ft. depth of blue mud of an impervious character. To those who have not the full facts before them the arguments are not as convincing as could be wished, and one cannot escape the impression of a dam subject to upward pressure from beneath, and of cut-off walls resting on an insecure foundation, and of ugly possibilities of seepage under the dam. It is more than probable that such impressions would be removed by more exact knowledge of the facts, for it is not to be supposed that the engineers would willingly take such serious risks.

The embankment consists of gravel on the lower side and of fine selected material, rolled, on the upper side. The gravel is of a consistency which will not slough under saturation. This is a very important point, for the dam which will allow water to drain away after seepage may stand well in spite of that seepage, and for this reason the rock filled drain, which extends along the entire length of the lower toe, and which is connected to the drains in the bank, is to the good. The fine material forming the watertight portion of the dam is spread in 6 in. to 8 in. layers, and is rolled with a pressure of 300 lb. per square inch. It is to be noted that the material was spread before rolling, and that all rocks over 4½ in. long were picked out. Smaller rocks were left in, but were well distributed. Here, again, the English engineer will look askance at the presence of these smaller rocks in puddled clay. Also, we are told that all stumps larger than 12 in. in diameter were removed from the dam site. Apparently, the smaller stumps were not removed. Evidently the facts that the smaller stumps remained, and that the smaller rocks were allowed to form part of the puddled clay, were appreciated by the engineers and considered to be matters of minor importance; but they are none the less puzzling. It also appears that a roadway will be formed across the dam connecting two important railways, and therefore, presumably, likely to have to support heavy motor traffic. Whether the vibration caused by such traffic can be safely sustained by an earthwork dam is open to question. It is not that the earthwork structure under normal conditions would be insufficient: it is that in the event of the embankment being weakened by seepage or undermining the vibration would tend to accelerate movement. It is therefore a question of general policy whether dams should be made use of in this way.

* * *

Safety First.

The views which we ventured to express in a recent issue with regard to the "safety first" campaign for minimising the dangers to pedestrians caused by existing traffic conditions in the Metropolis are endorsed in a remarkable manner in a letter from "A Ratepayer" which appears in the columns of a contemporary. The writer points out that it is patent to anyone who chooses to watch the traffic at a dangerous crossing that a large proportion of motor-drivers consider a few blasts from their horn to be all that is requisite to secure them a passage free from accident. "No reduction of speed is made, and it is quite evident that foot passengers must get out of the way or be run over. To put it plainly, these men exhibit a brutal disregard for human life. Most motorists insure against accidents, and verdicts of manslaughter are extremely rare, which facts can but conduce to carelessness. Turning to public vehicles, it is a cause for much wonderment and reflection why motor 'buses are allowed to travel at quite twice the speed of trams when negotiating dangerous crossings and corners. Perhaps the police can explain."

In the latter part of the letter the writer makes some practical suggestions in regard to reduced lighting, which appear to us to be of the greatest interest and importance. In the first place, the present primitive method of obscuring the light from street lamps causes much unnecessary inconvenience to traffic and danger to foot passengers. Light seen from above can proceed only from the source itself, or by reflection from the ground, &c. The former can be cut off by screens, permitting no rays above the horizontal to emerge, though in view of possible refraction and diffusion by water particles in the air it would be better to reduce the angle considerably below 90 deg. The latter can be minimised by the use of a diffusing medium. Our lighting experts also seem to ignore another elementary fact—viz., that the human eye is not constructed to receive horizontal rays of light. Our streets are therefore full of vehicles bearing lamps that throw horizontal rays full into the eyes of persons coming in the opposite direction, with the result that these unfortunate people are absolutely incapable of seeing anything behind the light. Carts drawn up close to the kerb constitute the gravest danger in this respect. As a pedestrian approaches a lamp of this description his iris contracts with the glare. When he passes the lamp the ensuing gloom is accentuated by the contracted iris admitting only a minimum amount of light. If he then attempts to cross the road he is in the worst possible condition to detect advancing traffic. Yet certain public bodies hang "guard" lamps on refuges at a height level with the eye! Obviously the remedy is to require all lamps used on vehicles to have a frosted or obscured glass, so as to cast a diffused light. In fact, to secure ideal conditions in our streets at present, no direct rays should be allowed to reach the eye at all. Enough has been said to show that the securing of safety

is not to be realised by the mere expedient of training the public in motor dodging. What is required is reduced speeds coupled with the application of common sense and scientific principles to the problem of reduced lighting, which is, of course, an absolute necessity in present circumstances.

Insanitary Property at Bristol.

The tender-hearted councillor whose sympathies are exercised on behalf of defaulting property owners had a not very happy experience at the meeting of the Bristol Town Council on Monday last. Without moving a definite resolution, he formally called attention to the large number of closing and other orders made by the Health Committee under the Housing Acts since the commencement of the war, the inability of tenants of houses so closed to obtain other houses, and the present difficulty and expense of effecting repairs. It is only fair to admit that the case of the tenants was argued with a certain amount of plausibility, but the burden of the councillor's tale was undoubtedly the difficulty owners had in getting repairs executed owing to the shortage of labour and the high prices of materials. These difficulties were no doubt genuine and considerable, but it did not appear that the Health Committee had committed the blunder of altogether overlooking them. It was explained that during the twenty-eight months of the war 187 closing orders had been issued, and that eighty of these related to void or derelict premises. Forty-one of the cases had been determined, the houses having been put into decent condition, and thirty-four of the orders had resulted in demolition. The plea for the suffering tenants, in so far as this related to disturbance, broke down completely, for it was explained that in the instances of thirty-six closing orders the tenants were still in occupation. This was described by Dr. Colston Wintle as an example of "long-suffering" on the part of the Health Committee, but it may be questioned whether the suffering does not also apply to the lot of the unfortunate people who are inhabiting these unwholesome dwellings. The Health Committee have, as a matter of fact, stayed their hands to an appreciable extent in so far as the issue of notices to repair are concerned, this clemency being due to a recognition on their part of the scarcity alike of materials and labour, as well as the difficulties of borrowing money. But, while such consideration is doubtless necessary in the circumstances, it is at the same time desirable not to play into the hands of defaulting property owners in too full a measure. The ruling of the town clerk on this occasion was a stern reminder that the position of the public authority in reference to insanitary property is defined by its absolute responsibility to the law. Replying to a proposal by the councillor who raised the subject that the Health Committee should be instructed to stop the issue of closing orders or orders to do repairs till six months after the war, he stated that the city council could not pass a resolution prohibiting itself from carrying out duties cast upon it by Act of Parliament. In any case, it was by no means probable that the city council would have entertained such a stultifying proposition, except to treat it with ridicule.

Employment of Discharged Soldiers.

A problem of immediate and pressing necessity arising out of the war is that of finding suitable employment for men discharged from the Army as partially disabled, and who, although no longer fit for the hardship and exposure of military life, are nevertheless capable of doing certain classes of civil work. One kind of work which is peculiarly suitable for such men is that of motor driving, or acting as conductors on tramways, and we observe with satisfaction that a number of discharged soldiers have already been taken on by the Leeds Corporation Tramways Committee for employment in this capacity. Work of this kind, however, naturally takes a little while to learn, and certain members of a body known as the Leeds Trades and Labour Council are apparently angry because the men are not paid during the week or so that is necessarily spent in training. At a recent meeting one member spoke of the "brutal action" of the committee in requiring men who have been disabled in fighting their country's battles, and who are now discharged, to work from six to twelve days without remuneration, while another described the department as having been "inhuman enough" to ask him to work for ten days for nothing while he learned the job. One would hardly imagine from this kind of talk that it has been the usual practice of the committee not to pay prospective employees for the few days necessary for learning the work. It is, of course, open to the Trades and Labour Council, or any other body to object to this system, and to seek by all legitimate means to secure its abolition if they do so object. But the attempt to make a discharged soldiers' grievance out of it is obviously insincere and much to be regretted; and it is not in this spirit that after-war problems will be worked out in the national interest. It is, however, satisfactory to record that the opinions extended were those of individuals, and that they were not endorsed—nor repudiated—by the council as a whole.

* * *

Institution of Municipal Engineers.

A programme of considerable interest has been arranged for the eighth annual meeting of the Institution of Municipal Engineers, which is to be held in London to-morrow. Mr. Henry Adams, M.INST.C.E., will give up the office of president of the institution, which he has held with such distinction during the past year, and he will be succeeded by Mr. Edward Whitwell, the engineer and surveyor to the Abersychan Urban District Council. In addition to hearing Mr. Whitwell's inaugural address on assuming the presidency of the institution, the members will have an opportunity of discussing three papers. The first is entitled "A Résumé of Public Health Matters," and will be read by Mr. G. Belson Chilvers; the next, presented by Mr. George Rodley, deals with "Practical Road Work;" while Mr. Horace Boot, a past-president, takes as his subject "Notes on the Use of Electricity in Municipal Engineering." These subjects are all of special interest at the present time. It is well known that a great war is invariably followed by a period of special anxiety in regard to public health matters, while the present struggle has raised problems of highway construction and maintenance of extraordinary difficulty. There should thus be plenty to interest the members attending the meeting, in spite of the fact that the usual round of visits will not take place.

"THE SURVEYOR" SPECIAL ISSUE.

The Special Annual Issue of "The Surveyor" will be published on January 26th, and readers who propose to accede to our request for a short statement, for inclusion in the number, of the works projected by their authorities for 1917, will greatly oblige by making their return as early as possible. All other material, and particularly matter accompanied by illustrations, should likewise be forwarded without delay to ensure its appearance.

A New Type of Trickling Filter.

By Lieut.-Col. G. G. NASMITH, C.M.G., PH.D., Director of Laboratories, Department of Public Health, Toronto, Canada.

[Reproduced, by kind permission, from the Journal of the Royal Sanitary Institute for December (Vol. xxxvii., Part 4).]

The object of every method of sewage disposal is to preserve the complicated putrescible organic materials present in the sewage, by converting them into simpler, less easily inorganic, compounds which are no longer decomposable, and incapable of causing offence. In other words, it is to create a harmless and non-putrescible effluent. Such an effluent is commonly said to be "purified."

Methods such as that of the septic tank fail, because, working in the absence of oxygen, they only partially split organic material, and these products of hydrolytic action have still to undergo further destructive processes in the presence of oxygen before they become stable.

Sewage disposal in the ordinary sense of the term resolves itself in chemical terms to the formula—Organic matter + oxygen = inorganic matter + humus (a stable organic material).

The aim of every method of sewage disposal has been to take advantage of the oxidising properties of living micro-organisms. Methods which have failed are those which have not provided the necessary conditions, that is, a sufficiently large mass of aerobic micro-organisms, properly harnessed to work in the presence of an abundant supply of air.

Without going into detail, it has been established beyond question that the only methods of sewage treatment which fulfil the above conditions are the trickling filter and the more recent activated sludge method.

The trickling filter requires specially prepared bacteria beds, several feet in depth, made of stone, slag, coke, or other resistant material, as a nidus for the bacterial growth. Sewage, when sprinkled or sprayed over the surfaces of such beds, slowly trickles over the pieces of stone until it finally reaches the bottom. In the course of a few weeks the pieces of stone become coated with a pellicle of slime, which has been shown to consist principally of bacteria and protozoa. It is this living slime which, in the presence of the oxygen of the air, oxidises organic matter.

From the sewage slowly trickling over the surface of this bacterial slime the organic matter is abstracted and decomposed into simpler products. These simpler products are chiefly nitrites, nitrates, carbon dioxide, sulphates, and a brownish-black non-putrescible material, easily sedimented, called humus.

If air is excluded from such beds, the oxidising action ceases, or if antiseptics are added in sufficient quantity to destroy the bacterial slime, the oxidising action also ceases.

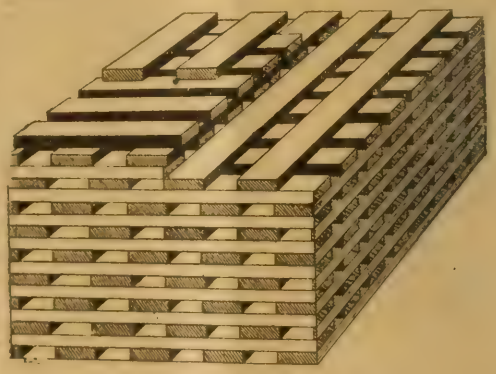
In the activated sludge method of sewage disposal a similar bacterial mass is gradually formed by blowing finely divided air through tanks filled with sewage. The sludge which forms by this treatment is allowed to settle, the supernatant fluid allowed to run off, and the tank again filled with sewage, after which the aeration is resumed. By degrees the sludge which accumulates acquires the same properties as the slime coating the filter beds. When fully matured this activated sludge will oxidise the organic matter in fresh sewage in from two to four hours when agitated continuously with it in presence of finely divided air, a perfectly clear and stable effluent is obtained.

The two methods briefly described above are practically identical in principle. In the trickling filter the sewage trickles over the bacterial mass in an atmosphere of air. In the activated sludge method the bacterial mass and sewage are kept in intimate contact by agitation with streams of fine air-bubbles. The end results are exactly the same. Furthermore, as in the trickling filter, the vast majority of the bacteria present in the sewage, including lactose fermenters, and also presumably the pathogenic varieties, are destroyed. . . .

In 1912 in an endeavour to devise a method for the disposal of the city of Toronto's sewage and reduce the estimated cost of the filter beds, I began experiments with a view to increase the efficiency of the trickling bed, always keeping the principles involved in mind. It was found that by the employment of screens or lattice work there could be increased in a given volume of space the surface area of the filtering material, and then a greater quantity of sewage could be passed over it and oxidised in a given time.

Experiments were therefore designed with the object of increasing the surface of the filter per cubic yard, and of allowing freer circulation of air than the ordinary types of filter-beds permitted. Wood was selected as the material lending itself best to the problem, and the first filter, 6 ft. square, was made of laths. The laths of the lowest layer were laid parallel to one another, the spaces between the laths being a little less than the width of the laths themselves. A second layer was laid on top of this and at right angles to it, with the same interspace. A third row was laid parallel to the bottom row, but in such a manner that the laths covered the spaces left between the laths of the lower series. In this way a filter 4 ft. in depth was constructed, in which the sewage, in order to reach the bottom, had to flow over a very large surface of filter. Air could enter from all sides and the top through the regular channels provided; in fact, one can see right through this filter, so uniformly regular are the spaces.

Sedimented city sewage was allowed to trickle over the surface of this lath-filter; in less than a month the filter was mature, and the results obtained thereafter exceeded all expectations. Where the standard type of stone filter, operated side by side with it as a control, treated 2,000,000 gallons of sewage per acre per day, the lath-filter treated 6,000,000 gallons and yielded a non-putrescible effluent. This lath-filter has now been in continuous use for three and a-half years, and has never failed to give satisfactory results.



From these results we argued that poles might give an even greater surface per unit of volume, because the poles would only come into contact along very narrow surfaces when built into a filter like the laths. Two such filters were built, each 6 ft. square and 6 ft. in depth; after maturing they yielded practically the same results as the lath-filter. They were, however, very difficult to construct; it was difficult also to obain an even distribution of the sewage flow, and short circuiting of the flow was also liable to occur. This form was abandoned as not being of practical value. One pole-filter, however, was installed in 1914 at the City of Toronto Industrial Farm to treat the sewage from several hundreds of people. No provision had been made for the fact that sewage in small communities frequently comes in gushes, and consequently, as the bed was overdosed at some periods and had no work to do at others, the results were not satisfactory. These defects have recently been remedied.

A filter built of slabs of wood was discarded, as it was only capable of treating sewage at the rate of 3,500,000 gallons per acre per day.

Finally, having proved our theory to be correct, and having made some preliminary experiments, it was decided that brushwood, pressed into bundles, would make the ideal filter for filter-beds, because it would provide the combination of a very large surface area and presence of air which is so essential.

When the town of North Toronto was annexed to the City of Toronto a few years ago it had a system of sewage disposal, part of which consisted of three trickling stone filters, each 30 ft. in diameter. In the early spring of 1914 we had the stone removed from one of these filters. Bundles of brushwood, cut from the woods near by, were made on the spot by means of a rough box-press, wired together, and placed in the filter until a depth of 4 ft. had been obtained. A space of 1 ft. was left between the brush-bundles and the wall, and a small space in the centre so as to allow air to enter freely from the sides. The old revolving distributing sprinkler was then put into operation, the brush quickly became matured, and in two months it was treating sewage at the rate of 6,000,000 gallons per acre per day. A very high degree of nitrification has been obtained; the effluent has been uniformly stable; and the installation has proved to be a decided success. This brush-filter has now been in operation for two years, and has worked just as well in winter as in summer. Of course, it is always necessary to cover filters of every description in winter in Canada to prevent freezing. A brush-filter that was operated in the open to prove whether this would occur in the Toronto climate rapidly froze solid.

After three and a-half years the lath-filter shows no signs of incipient decay, confirming the common experience that wood which is kept constantly wet does not decay. In both the lath and the brush filter the wood is covered with slime, so that the wood is always soaked.

The advantages of the brush-filter may be summarised as follows: (1) Brush is cheap, and may be obtained almost anywhere; (2) skilled labour is not required in construction; (3) it does not sludge; the slime will frequently become quite thin after heavy rains, when the sewage is diluted, though the efficiency of the filter is unimpaired; (4) the brush may at any time be removed and burned; (5) it is durable—a filter has now been in operation for over two years without showing any signs of decay; (6) the distribution of the sewage over the surface of the filter does not need to be very uniform; the general tendency is to redistribute itself in the filter meshwork; (7) it gives the maximum amount of surface, with a freer circulation of air in a unit volume of space; (8) it has proved to be a success when treating the sedimented sewage of a city on a large scale, and has treated three times as much sewage to the acre as the standard stone filter will treat.

Unfortunately, on account of the war, I have not been able to give in detail the results which have been and are still being obtained since the filters were put into operation. This brief summary is being given in order that others may avail themselves of our experience. Patents were applied for in the year 1914, in order to protect the City of Toronto until such times as our experiments should be completed. No rights or royalties are claimed, however, in connection with the process. In fact, it is hoped that the cheapness of the system will enable communities to instal systems of sewage disposal in districts where the high cost of the accepted types of installation have been prohibitive in price. In the prairie provinces of Canada, for example, where stone would in many cases have to be hauled by train for hundreds of miles, and costs a great deal, the brush-filter should solve the problem in regard to expense of installation.

In conclusion, I wish to express my great appreciation of the work of my assistants, Mr. J. Scott, chemical engineer, who has carried out the construction of, and has been responsible for the operation of all the experimental filters, as well as the chemical analyses in connection therewith, and Dr. F. Adams, D.P.H., who has supervised this work in my absence. I am also greatly indebted to Mr. R. C. Harris, Commissioner of Works, and to Mr. Worthington, engineer-in-charge of the sewage system, through the unfailing co-operation and interest of both of whom it has been possible to carry out the experiments on a large and practical scale.

The Price of Victory.—Penge Urban District Council were engaged recently in a law case over the Croydon-road public lavatory, in which they were successful, but in spite of this the bill of costs incurred amounted to £537, which was duly passed upon the recommendation of the Finance Committee. One member described the bill as a bomb-shell, but it was explained that the clerk had acted on the instructions of the council. He had to engage an expensive counsel because the other side had a K.C.

FOOD PRODUCTION IN WAR-TIME.

LOCAL AUTHORITIES AND THE CULTIVATION OF SURPLUS LAND.

In connection with the Government scheme for increasing food production in Ireland, the Secretary of the Local Government Board has issued a letter to every urban council in Ireland stating that, with a view to increasing the area of land under cultivation in Ireland, His Majesty's Government had resolved upon means which would enable urban district councils to take by agreement land for the purpose of letting it in allotments to workmen resident in the district who were not in occupation of land, and who were willing to undertake the cultivation of potatoes and oats. Arrangements are also being made for loans for the purchase of seed potatoes and oats.

AMPTHILL U.D.C.—A letter was received at the last meeting from Mr. C. P. Hall stating that the Duke of Bedford was prepared to offer the council about 100 acres in whole or in part at the Warren Farm, Millbrook. This land has been unoccupied for several years, but excellent potatoes and vegetables had been grown on some portions during the past season. A similar offer was being made to the rural district council, and it might be possible, in view of that authority wishing to take some land, to divide the area and meet the wishes of each council as far as possible. Members felt that it was an important matter, and it was left to a committee with executive powers.

BLACKBURN T.C.—The corporation have in hand the securing of suitable plots of land for cultivation. The land at Roe Lee, given by Messrs. J. Duckworth and J. R. Eddelston for a park, will be cultivated under the scheme; and the committee have visited the corporation and Queen's Parks with a view to selecting suitable plots. The committee will break up the land in the first instance, and will, if possible, provide seed, manure, and implements at cost price to the cultivators. The committee will also arrange for expert assistance to be given in the preparation and cultivation of the allotments.

HULL T.C.—The Parks Committee have decided to bring into cultivation for potatoes, oats, and wheat 67 acres of corporation land. Unfit soldier labour was suggested, and a councillor offered to lend the necessary ploughs.

LLANDUDNO U.D.C.—The chairman of the Finance Committee, Mr. R. Roberts, stated at the council meeting recently that his committee were moving energetically in the matter of providing land for producing food, and Lord Mostyn, the principal landowner, had stated that he would give all possible assistance in the movement.

ST. IVES T.C.—Many applications have been received for plots of land for food-growing, and these have been referred to the General Purposes Committee, which is dealing with the matter.

SHREWSBURY T.C.—Alderman Deakin stated at the council meeting on Monday that the Improvement Committee had inspected various plots of land and were prepared to make certain recommendations. The number of applications received for allotments up to the present time was seventy-two. It was proposed to grow a considerable quantity of potatoes on the sewage farm, and to use the land acquired for the extension of the cemetery for the same purpose.

WALMER U.D.C.—It has been decided to devote the public recreation ground to the growing of potatoes and other vegetables during the war. The ground will be let to applicants free of all rent on the sole condition that it is used to the best advantage for producing food.

WOKING U.D.C.—The council are sowing with wheat land acquired for a housing scheme, and intend to prepare for cultivation next spring part of the public recreation ground.

Road Work for War Prisoners in Essex.—It was reported at the last meeting of the Essex County Council that the War Office had been asked to arrange for the employment of German prisoners of war in repairing Essex main roads. All the surveyor's staff of military age have been released for road making behind the British lines in France, and ten steam rollers have been lent for the same purpose.

ACTIVATED-SLUDGE EXPERIMENTS.*

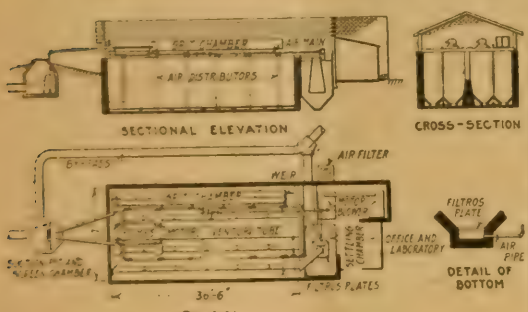
By Edward Barrow F. W. Mohlman and J. F. Schnellbach.
Illinois State Water Survey.

The first series of activated sludge experiments at the University of Illinois began November 1, 1914, was carried out in 3-gallon bottles. The second series was conducted in a tank 7 ft. square and 4½ ft. deep. The third series was conducted in four tanks each having an area of 10 sq. ft. and a depth of 9 ft. Experiments in the first three series were carried on by the fill and draw plan. At present, for the fourth series, a continuous-flow plant is being successfully operated. This series is conducted in the septic tank designed by Prof. A. N. Talbot in 1897 for the city of Champaign. Early in 1916 this tank was placed at the disposal of the State Water Survey, and was reconstructed with the expectation that 200,000 gallons of domestic sewage be treated daily.

design of plant.

The plant (see accompanying illustration) contains a screen chamber and pump pit, a grit chamber, an aeration chamber, a settling chamber, a blower-room, and a laboratory. A sludge-drying bed and a pond into which the effluent from the process may be discharged are also provided. Plans have been made for the installation of sludge-drying apparatus.

The sewage is drawn from the main outlet sewer of the city of Champaign. The daily flow is from 1,000,000 to 1,500,000 gallons. The manhole nearest the septic tank was modified to serve as a screen chamber and suction pit for the pumps. A weir was placed in the outlet to raise the sewage level and



provide suction for the pumps. Vertical bars spaced with ¾-in. openings prevent coarse material from reaching the suction of the pumps. The sewage is pumped to a grit chamber by two centrifugal pumps, one with a capacity of 75 gallons and the other of 110 gallons per minute. Each pump is belt-connected to a 3-h.p. electric motor. The grit chamber is 34 ft. long, having two compartments each 1 ft. wide. At the outlet is an adjustable weir through which the sewage must flow and where its rate can be measured.

The sewage flows from the grit chamber into the aeration chamber, a rectangular concrete tank 17 ft. by 30½ ft. in plan and 9½ ft. deep, having a capacity, after allowances are made for the baffle walls and the sloping bottoms, of about 36,000 gallons. The chamber is divided longitudinally by three baffles into four compartments through which the sewage travels a distance of about 140 ft. The lower part of each compartment has sides sloping toward the centre to a channel 12½ in. wide and 4 in. deep, extending lengthwise through the tank. Above this channel filtros plates are supported on T-bars that have been embedded in the concrete. The channel below the filtros plates was divided into sections for the filtros plates with the expectation that each set of plates would be separated from all the others, and that the supply of the air to the plates could be controlled by an air pipe and valve for each set. Owing to the tapering of the sloping concrete sides it has been found impossible to regulate independently each set of plates. The aeration tank should be capable of treating 144,000 gallons of sewage and sludge per day if aerated during a period of six hours; 576,000 gallons if aerated four hours, 216,000 gallons if aerated two hours.

The aerated sewage and sludge flows from the aeration chamber to the settling chamber. The settling chamber is 6 ft. by 10½ ft. in plan and 10½ ft. deep at the lowest point. It has a capacity of 3,700 gallons. This would give a retention period of twenty-four minutes, thirty-one minutes, and thirty-seven minutes, with a flow of four hours, five hours and six hours respectively, through the aeration chamber.

In order to assist the settling of the sludge, the liquid is passed down through the centre and up around the edges of a hollow wooden pyramid placed in the centre of the settling basin. The pyramid is 15 in. square at the top, 3 ft. square at the bottom, and extends to within 3½ ft. of the bottom of the chamber.

From the settling tank the effluent flows over a weir to the creek or into the pond. The pond is formed by two dams placed across the abandoned bed of a small stream. It covers about 0·1 acre, and is 3 ft. deep in the deepest part.

The sludge is withdrawn from the settling chamber by an air lift, and can be discharged into the raw sewage, where it enters the aëration chamber, or can be diverted for experimental purposes, or to the sewer. Some sludge has been dried on a sand bed having an area of 256 sq. ft. and a depth of 8 in. The drying of sludge on the sand bed is not considered a success.

Air is supplied for aëration and for the air-lift by a rotary positive-pressure blower having a rated capacity of 300 cub. ft. per minute, driven by a 15-h.p. electric motor. The air is filtered through cheese-cloth spread over a wire box before it enters the blower suction pipe. The air is measured through a Venturi meter.

performance of plant.

The plant has been in continuous operation for twelve weeks (on October 4, 1916), prior to which time it was operated intermittently for periods of from one to three weeks. No special effort was necessary to build up activated sludge. The plant has simply been put into operation, allowing the effluent from the settling chamber to escape while pumping back the sediment. From the start 90 per cent of the suspended matter was removed, and after thirteen days of operation stable effluents were obtained.

The results achieved have been very gratifying. Purification is indicated by the presence of from 5 to 8 parts per 1,000,000 of dissolved oxygen and the stability to methylene blue of from five to fifteen days. The effluent is odourless and generally clear, though at times, because of the insufficient capacity of the settling chamber, it contains small particles of sludge.

The plant has been run to obtain a clear effluent. Owing to the insufficient size of the settling chamber the actual rate of operation has been less than one-half of its rated capacity. Additional settling chambers are to be installed.

After satisfying ourselves that the plant could be run satisfactorily at a rate suitable to the capacity of the settling chamber, the rate has been increased to 150,000 gallons per day, even though some sludge escapes with the effluent. At this increased rate, using 2 cub. ft. of air per gallon of sewage, stable effluents have usually been obtained. Owing to the presence of sludge in the effluent, the effluent was allowed to settle in glass cylinders 30 minutes longer before taking samples for analysis.

Coast Sand Dunes (By Gerald O. Case, St. Bride's Press, Limited, 24 Bride-lane, E.C., price 5s.).—Mr. Case has done a valuable work in the writing of this book.—*Southport Guardian.*

Elgin Tar-spraying Costs.—The burgh surveyor, Mr. A. A. Turriff, reports that the area of roadways in Elgin tar-sprayed during last year amounted to 79,767 super. yds., at a cost of £462 14s. 2d., or 1·39d. per super. yard, as against ·63d. in 1915 and ·58d. the year previous.

A Good Roads Train.—In the report of the United States Office of Public Roads and Rural Engineering for the year ended June last, the interesting statement is made that a "good roads" train, equipped by the department with a complete set of road models and photographs, and including a lecture car provided with stereopticon and cinematograph equipment, was operated throughout the State of Iowa. Stops were made at 131 towns and cities, and 200 lectures and demonstrations of models were made during these tours. The total attendance at the lectures and demonstrations was 22,000.

New York City Water Supply.

THE CATSKILL MOUNTAINS SCHEME.

By W. J. E. BINNIE, B.A., M.INST.C.E., F.G.S.

[Mr. Binnie was on Wednesday evening installed as president of the Institution of Sanitary Engineers in succession to Mr. A. P. I. Cotterell, M.INST.C.E., and delivered a long and interesting address on the subject of Waterworks Engineering, dealing first with the water supply works of Ancient Rome, and turning to the greatest undertaking of modern times the Water Supply of New York from the Catskill Mountains.]

Before commencing this gigantic work preliminary investigations were undertaken by means of boreholes on a scale which was truly colossal, and by 1910 the length of core boring and pits for trial purposes aggregated nearly 33 miles, so that for every mile of the aqueduct there was over ¼ mile in depth of boring and trial pits.

As an example of the magnitude of some of this preliminary work, I cannot do better than refer to the boreholes at the proposed crossing under the river Hudson. It was decided to cross the Hudson at Storm King, and at the point of crossing the hydraulic gradient would be 400 ft. above the level of the river, which at that point was over ½ mile wide. The Hudson now flows in a valley filled with water-borne deposits of sand, gravel, boulders, clay and silt, the maximum depth of water in the river at the point of crossing being about 100 ft., and it was known that the rock in which the old river had eroded a channel was overlain by a great depth of these deposits.

THE HUDSON RIVER CROSSING.

There were four possible methods of crossing—(1) by a bridge 150 ft. or more above high-water level to carry steel pipes; (2) steel or iron pipes laid in trenches dredged in the river bottom; (3) shield-driven tunnels under compressed air at a depth not greater than 100 ft. below water level, steel lined or containing pipes; (4) a pressure tunnel deep in sound rock.

Of the four methods the pressure tunnel—*i.e.*, a tunnel designed to carry water under pressure—would be the cheapest and most durable, and the problem to be solved was the location of the surface of the rock, as, owing to the internal water pressure to which the tunnel would be subjected, it was necessary to be deep in sound rock. Borings were started from barges in the ordinary way, but the difficulties proved almost insuperable, owing to the swift currents, heavy traffic on the river, short working season, and the great depth at which the rock lay, so that after four years of drilling only six holes reached the rock below the river channel. The borehole near the centre of the channel did not meet rock, and was abandoned at a depth of 768 ft.

It was early realised that vertical borings would only give inconclusive evidence as to the rock profile under the Hudson River, and the drilling proved so slow that it was evident that enough boreholes could not be put down in time to give even a fair estimate of the depth of sound rock underlying the river. Two shafts were therefore sunk, one on each side of the river, to a depth of 1,100 ft., chambers being formed in the sides of these shafts at a depth of about 250 ft. below the surface, and inclined boreholes were started from these chambers, which were to cross each other under the river and so determine whether solid rock was continuous.

The first two boreholes were driven at such an inclination as to cross each other at a depth of about 1,500 ft. below the surface. They were commenced in 1909, and the borehole from the east shaft, which was 1,834 ft. long, took seven months to complete, that from the west shaft, which was 2,052 ft. long, taking eight months, both boreholes being completed by March, 1910. These holes, which were bored by diamond drills, were commenced 4 in. in diameter, and gradually decreased to 1⅞ in.; 55 per cent of the core was recovered from the bore at the east and about 66 per cent was recovered from that at the west shaft.

These boreholes showed that solid rock existed right under the Hudson at that depth, and two further boreholes were then commenced, which were completed in August, 1910, after four months' work. These boreholes were inclined at an angle of about 23 degrees to the horizontal, and intersected each other at a depth of about 960 ft. below the surface, the length of each being about 1,620 ft.

The core recovered amounted to about 70 per cent, and the fact was established that if the tunnel was driven at a level of 1,100 ft. below the surface it would lie deep in solid rock, and therefore this was fixed as the level of the tunnel below the river.

The cost of these boreholes was about £12,000, and it was felt that the money was well spent, as previous experience with the Croton Aqueduct showed the necessity of ascertaining the nature of the strata beforehand, as a considerable length of tunnel under the Haarlem River had to be abandoned and reconstructed at a lower level owing to a deep channel in the rock, which was only discovered when reached by the tunnel.

THE ASHOKAN RESERVOIR.

Turning now from preliminary investigation to the actual scheme as it was carried out, a gigantic reservoir, called the Ashokan reservoir, was constructed primarily to store the waters of the Esopus and Beaver Kill, the former river being impounded by the Olive Bridge masonry dam, the latter by means of embankment.

The Esopus watershed is 245 square miles in area and the Beaver Kill 17 square miles, and these drainage areas are estimated to yield 250,000,000 gallons per diem. In addition to the Esopus and Beaver Kill, three other sources can be made contributory to the scheme—the Rondout, estimated to yield 115,000,000 gallons per diem; the Schoharie, estimated to yield 136,000,000 gallons per diem; and various drainage areas situated in the Catskill Mountains, estimated to yield 149,000,000 gallons; giving a gross total of 660,000,000 gallons per diem. The Ashokan reservoir can make provision for part of the yield of the Schoharie and Catskill watershed, which are not yet made contributory to the scheme.

The total storage provided by this reservoir is 130,000,000,000 gallons, or ten times the quantity which can be stored in the Vyrnwy reservoir of the Liverpool Corporation, the largest artificial reservoir yet constructed in this country, and as the aqueduct is designed to discharge 500,000,000 gallons a day, the reservoir capacity is 254 days' supply of the discharging capacity of the aqueduct.

New York already has two sources of supply, the Croton and the Bronx, which are estimated as being capable of yielding about 400,000,000 gallons per diem, so that with the additional supply afforded by the Catskill scheme, New York will have a supply amounting to approximately 900,000,000 gallons per diem. Some idea of what this means can be realised when it is remembered that the average natural flow of the Thames at Teddington Weir is 1,100,000,000 gallons per diem. The population of Greater New York is about the same as that of Greater London, but New York requires 100 gallons per head of population per diem, whereas London is content to put up with less than forty; consequently the total quantity supplied to London is only about 250,000,000 gallons per diem.

A GIGANTIC MASONRY DAM.

The sheet of water formed by the reservoir is over 11 miles long, and the maximum breadth is over 2 miles, the water area when the reservoir is full being about 16 square miles. The total length of masonry structures and embankments which were necessary to impound the water is over 5½ miles, but the length of masonry included in the above is only 3,100 ft., the remainder being embankment. The Olive Bridge masonry dam closes the Esopus gorge, the water impounded having a maximum depth of 190 ft. We have no masonry dams in this country to compare with it, as the Penygarrig dam of the Birmingham Corporation, the highest yet constructed, only impounds a maximum depth of 125 ft. of water. The structure has a length of only 1,000 ft., and the masonry above ground level is broken up into divisions by means of vertical joints—spaced 80 ft. to 90 ft. apart to prevent cracks through the face due to changes of temperature. The masonry at the expansion joint is a

formed that the two abutting sections of the dam interlock by means of tongues and grooves, and a vertical inspection well placed about 18 ft. to 20 ft. from the water face traverses the joint, affording the means of inspection and also of closing the joint if leakage should prove excessive. The vertical wells discharge into a longitudinal culvert, which communicates with a gallery discharging into the gorge below the dam. Another longitudinal gallery connects the wells at about top water level.

In addition to these inspection wells, 16-in. diameter vertical holes are left in the dam, spaced about 12 ft. apart, and surrounded by concrete so formed that any water which finds its way into the masonry would be intercepted and led away. These arrangements were made in order to prevent the uplifting effect of the water, which is bound to occur if it penetrates a horizontal crack or fissure in the dam. Novelty is claimed for this method of construction, but, as a matter of fact, the late Dr. Deacon provided similar joints more than twenty years ago when designing the Upper Neuadd dam for the Merthyr Tydfil Corporation, except that in that case asphalt was used at the joint to prevent leakage, and there were no vertical inspection wells.

The Olive Bridge dam is founded on hard bluestone rock, and the excavation was only carried to a moderate depth below stream bottom. It is of ordinary section, the total height above the stream level being 210 ft., and the maximum thickness at the base 180 ft. It carries a roadway 20 ft. above overflow level, and flood water escapes from the reservoir by means of a waste weir 1,000 ft. in length, which is located elsewhere. It was built of Cyclopeian masonry in the ordinary manner—i.e., large blocks of irregular-shaped stone bedded in concrete, and was faced with moulded concrete blocks.

EMBANKMENT CONSTRUCTION.

The several embankments required to fill up other valleys and gorges before water could be impounded in the reservoir follow the usual American practice in construction, which differs somewhat from that obtaining in this country. In order to prevent water from leaking either through or under an embankment, longitudinal core walls or watertight diaphragms are introduced traversing the centre of the embankment, which walls are carried down to the solid rock or an impermeable stratum, and in this country puddle clay is the material employed for the construction above ground, the cut-off trench below ground being generally filled with concrete. American engineers employ concrete for the core wall both above and below ground, and all the embankments of the Ashokan reservoir are so provided.

The reason for avoiding the use of concrete above ground in this country is because cracks in the concrete, due to changes of temperature or other causes, are to be anticipated, and water would tend to find its way through these cracks, whereas clay puddle, if kept moist, does not crack. Puddle, however, if it is to prevent percolation, must be good throughout, as the water will find the weak spot, and once erosion starts the embankment is doomed unless the reservoir can be emptied in time to prevent disaster. Concrete, on the other hand, does not erode, and therefore any leakage through any small cracks tend to become blocked up by means of the embankment material carried into the crack by the water. The maximum height of the embankment was at the Beaver Kill Gorge, where the top was 115 ft. above the bed of the stream, the foundations of the core wall going down to a depth of about 70 ft. below the ground surface.

The reservoir is divided into two basins by means of a weir about 100 ft. long and an embankment, the weir serving the purpose of passing overflow from one division to the other. The intake chamber is situated in the bank, with inlets from each basin, and two culverts, one over the other, are placed in a trench below the bank for conveying the water to the aqueduct, and two channels had to be excavated leading to the intake chamber, one in the east and the other in the west basin, for a total length of 8,800 ft. and a maximum depth of 80 ft., in order to allow of the water level being drawn down in the reservoir.

Considerable difference of opinion existed as to the advisability of stripping all vegetable soil from the site of the reservoir before impounding. It was finally held that aëration and filtration would probably be required to obtain a satisfactory water, and that therefore the cost of stripping, which amounted to £1,000,000 sterling, was to be avoided, seeing that it would have no beneficial effect if the water was aerated and filtered. The reservoir site was not stripped, and spiral aërator nozzles were designed to fountain the water into thin fins through the air before it entered the aqueduct, but hitherto filters have not been provided.

The outlet from the reservoir is so arranged that the water can be passed through the aërators or not, as desired, and before entering the aqueduct it passes through a gigantic Venturi meter, so that its quantity can be measured. The Venturi meter is constructed of reinforced concrete, with the exception of the throat and measuring ring castings, its total length being 400 ft., the waterway changing gradually from the normal aqueduct section to a circular bronze throat casting 7 ft. 9 in. internal diameter, the pressure tubes being connected one to the throat casting and the other to another circular bronze casting 17 ft. 6 in. in diameter, situated 30 ft. at the upstream side of the throat. The Venturi throat is depressed so that it is under a head of 25 ft., the ratio of contraction being about 5 to 1. Three other Venturi meters and several gauge chambers are provided at various points along the line of aqueduct, so that the amount of leakage between different points can be readily determined. The outlet pressure culverts terminate in a battery of 48-in. pipes, provided with special non-chattering valves, and the ordinary regulation of flow is by means of these valves, an overflow weir 100 ft. long providing for the escape of water should flow decrease in the aqueduct before the corresponding regulation of the valves can take place.

As the water level in the reservoir would generally stand much above that in the aqueduct, turbine machinery has been introduced for the purpose of utilising the head available for the production of electricity to give light and power for local service.

Some idea of the magnitude of the headworks can be gathered from the following figures: The work was let in several contracts, the chief of which covered 2,500,000 cub. yds. of excavation, 7,500,000 cub. yds. of embankment, and nearly 1,000,000 cub. yds. of masonry construction.

126-MILE AQUEDUCT.

Having now given a description of the headworks, I must pass on to the aqueduct and deal with it somewhat more briefly, as I fear that I have already somewhat exhausted your patience. The total length of the aqueduct from the Ashokan Reservoir to Silver Lake reservoir is about 126 miles, and the average fall about 2 ft. per mile. It is full sized until the 111th mile is reached, being at this point under New York City, where it commences to diminish in steps as water is taken off till it enters the Silver Lake reservoir as a 48-in. cast-iron pipe.

The chief feature of novelty, as far as English practice is concerned, is in the extensive use of pressure tunnels in lieu of pipe syphons. These tunnels are sometimes subjected to enormous pressure, the one constructed under the Hudson, already referred to, having to withstand an internal pressure due to a head of 1,500 ft. of water, which is equal to an actual crushing strain on the concrete lining of over 40 tons to the square foot, and, as the internal diameter of the tunnel is 14 ft., and the thickness of the concrete only averages 17 in., the tension in the concrete, if there was no external pressure to resist it, would amount to 200 tons to the square foot. These figures show how absolutely necessary it was that the tunnel should be driven in solid rock at a sufficient depth, and explain why such careful preliminary investigation was essential before the work was put in hand.

Some difficulty was experienced in driving this tunnel on account of the enormous pressure of the water which found its way in under the Hudson and rendered useless the ordinary method of grouting to seal back the water. This difficulty was successfully surmounted by special apparatus designed to inject Portland cement grout under pressure as high as 600 lb. per square inch.

The actual maximum water pressure recorded was 470 lb. per square inch, and, supposing the water-bearing seams had not been sealed up and that the water could work its way behind the lining and between it and the rock, the crushing strain thrown on the concrete would amount to 170 tons per square foot, when the syphon is empty, and it requires very good concrete indeed to stand this pressure without crushing, and considerable courage on the part of the engineering staff to design the tunnel so that there was a possibility of its being submitted to such strains.

I believe, however, that the Hudson syphon has proved satisfactory, although I see from the engineering Press that a pressure tunnel immediately adjoin-

ing it, and which was subjected to only about half the internal head, has shown signs of weakness, necessitating the abandonment of a short length of tunnel, which is being reconstructed at a lower level. This failure is attributed to local yielding of the gneiss rock in which the tunnel is driven, which allowed the concrete to be forced back under internal water pressure, causing the lining to crack, with consequent leakage of water.

The aqueduct consists in part of concrete cut and cover construction, following the hydraulic gradient, horseshoe-shaped in cross-section, and having a waterway of 241 sq. ft., or more than twice that of an ordinary tube railway tunnel. The concrete construction is covered with a bank having a width of 15 ft. and side slopes of 1 to 1¾, there being 3 ft. of cover over the crown of the aqueduct. This is the cheapest form of construction, costing a little under £12 per foot-run, and about 51 miles was built of this type.

(To be concluded.)

CORRESPONDENCE.

—EURIPIDES.

HOUSING AND TOWN PLANNING AFTER THE WAR.

To the Editor of THE SURVEYOR.

SIR,—I am very pleased to read some of the suggestions contained in the paper on "Housing and Town Planning After the War," by Councillor Harrison Barrow, of Birmingham, which appeared in your issue of December 29th last.

It is very desirable that new housing developments throughout the country should be on better lines than has been usual, and it is evident that the Housing and Town Planning Act, 1909, with all its good intentions, is too slow and clumsy to effect much change. Also its permissive character renders it of no use just where it, or something like it, is most needed.

The suggestion by Councillor Barrow that every town and urban district should be obliged to define the number of houses which may be erected per acre upon the land within its boundaries is simple and practical. It would allow full scope for local conditions, involve no tedious labour, and would accomplish all of practical utility that town planning in its most complicated and elaborate efflorescence could achieve.

One map, and that a 6-in. Ordnance, would be sufficient for defining zones, of which there may be three, or any other number which may be thought desirable. I see no reason to stick at three if more are better.

The numbers specified and the boundaries of the zones should be subject to revision every five years, and the numbers and zones should always be subject to Local Government approval.

If there were coupled with this the compulsory power to define building lines for all streets, then you have everything that is necessary to control development.

And you have it in a form simple to operate, easy to understand, prompt and fair in its action, and subject to popular control. No new principle (except the one of compulsion) is involved in the suggestions, they simply contain the marrow of the Housing and Town Planning Act compressed into tabloid form. No arbitrary standard would be thrust upon an unwilling community. It is simply left to each locality to work out its own salvation. But it must work.

The whole business could be put through Parliament and all the plans prepared, approved, and be operative for every town and urban district in the country inside six months.—Yours, &c.,

J. W. TOMLINSON.
Borough Engineer, Luton.

January 3, 1917.

THE DESIGN AND COST OF RESERVOIRS.

To the Editor of THE SURVEYOR.

SIR,—Having had the privilege of viewing the Cross Hill covered service reservoir during its construction, and being present at the meeting when Mr. W. J. E. Binnie, B.A.(CANTAB), M.INST.C.E., read his very able paper on the design and construction of these works, the writer considers the criticism by correspondent "Water," who finds it necessary to write under a *nom de plume*, somewhat disingenuous.

The insinuation that the engineers who are responsible for the design have not had sufficient experience in water engineering to warrant their departure from the orthodox design of service reservoirs is somewhat impressive.

To call the work "elaborate" is anything but correct.

The writer is, however, in full agreement with the remark, "somewhat unusual design," and thinks the engineers are to be congratulated on their spirit of originality; it would be a move in the right direction if more originality was put into the design of all municipal works.

With regard to the covering of the reservoir, the writer's experience fully endorses the provision made in the Cross Hill covered service reservoir, more especially as the water to be impounded will be "filtered"; serious contamination can arise with water impounded in open reservoirs, notwithstanding the site of the works might be similarly situated to the reservoir under review.

No water after being filtered and used for domestic purposes should be exposed to atmospheric conditions prior to its use.

On "Water's" own estimate the cost of the covered service reservoir justifies its adoption, as Mr. Binnie's figures, £2,625 (per 1,000,000 gallons capacity) are from actual cost, while the £2,465 is purely an estimate.—Yours, &c.,

FRED. J. DIXON, M.INST.C.E.

Town Hall Chambers,
Ashton-under-Lyne.
December 30, 1916.

ROAD SERVICE IN FRANCE.

To the Editor of THE SURVEYOR.

SIR,—Your leading article and the letters of your correspondents overlook an important aspect of the case, and that is, the possibility of filling up these commissions by men *over* military age. It will be remembered that about eighteen months ago a number of Navvy Battalions were recruited for roadwork in France, the navvies to be aged forty to forty-seven. Being over military age, I applied for a commission, but found that the age limit for officers in these battalions was fixed at thirty-five. I got in communication with the War Office at that time through our local Member of Parliament, and the reasons they gave for fixing the age limit at thirty-five were—(1) That the work was too strenuous for men over thirty-five (although they accepted navvies up to forty-eight!), and (2) that they had received sufficient applications from men under thirty-five.

I presume it did not occur to them that they could have got sufficient navvies under thirty-five as well if they had asked for them. However, now that we have got a practical man at the head of affairs in the person of Brigadier-General Maybury the age limit has been raised to fifty.

It appears to me that, under the circumstances, the first consideration should be—can these posts be filled by men *over* military age? I think it is time the venerable greybeards of the age of forty-five to fifty had a sporting chance. Of course, if sufficient of these "antediluvians" cannot be obtained, by all means give preference to men now in the Army rather than to men of military age who have not yet joined up.

One wonders how those men stand who were declared by their councils to be indispensable when required for the fighting units, and who are now being granted permission to join the Road Service battalions.—Yours, &c.,

DUG-OUT.

December 30, 1916.

Business Announcement.—We are informed that, as from December 19th last, the registered name and title of the Anglo-Mexican Petroleum Products Company, Limited, will be Anglo-Mexican Petroleum Company, Limited, the word "Products," which has hitherto formed part of the company's name, being omitted. This change has been made solely to simplify the title of the company, and involves no alteration whatever in the control organisation or operation of the business. The company will, as heretofore, continue to market the well-known products of the Mexican Eagle Oil Company, Limited including fuel oils and Diesel oils, Mexphalte and Fluxphalte for road construction, lubricating oils, paraffin wax, &c. The Anglo-Mexican Petroleum Company, Limited also import Mexican kerosenes and motor spirit which are marketed in the United Kingdom by its sales agents, the Bowring Petroleum Company, Limited, under the brand names of Snowflake, Bearcreek and Empire lamp oils, and Mex motor spirit.

LONDON'S WATER.

RESISTANCE TO FILTRATION EXPERIMENTS.

By Dr. A. C. Houston,
Director of Water Examination, Metropolitan Water Board.*

By "resistance to filtration" is meant the degree to which the living and dead suspended matters in a water interfere with its filtration. The subject is of great practical as well as of scientific importance, for several reasons. For example, the average cost of filtering water is said to be about 28s. per 1,000,000 gallons. About 20s. of this goes in interest on capital charges, leaving 8s. for working costs. The above is quite irrespective of pumping costs before or after filtration. If the pre-filtration waters contained no suspended matters, the filters, if protected from light, would practically never require to be cleaned, and on every 1,000,000 gallons filtered there would thus be a saving, theoretically, of nearly 8s., assuming it to be true that most of the 8s. is expended on cleaning operations, and putting on one side for the moment the necessity of maintaining a staff adequate to deal with all emergencies. If the suspended matters were reduced one-half, presumably nearly twice the amount of water (2,000,000 gallons) could be filtered at a like cost. This would, theoretically, mean a saving of 4s. per 1,000,000 gallons, and for less than this sum 1,000,000 gallons could be treated with an algicidal agent. It follows that when algal troubles are the cause of the filters blocking a point may be reached when the use of an algicidal agent is economically advantageous. It must, however, be remembered that these growths develop not only in the storage reservoirs, but in the water lying over the sand in the filters and in the skin itself. It should also be noted that the treatment should precede the algal development, as a water, once it has become badly affected, may continue to filter badly even after treatment with an algicide.

These calculations are admittedly based on theoretical rather than on practical considerations. The information apparently required is the cost of cleaning the filter beds under normal conditions, and the additional cost thrown on the board when the conditions are abnormal. If this extra cost could be wiped out by the use of algicidal agents at a less cost than the price of the chemicals, the matter becomes one of practical politics, assuming always the possibility of reducing the working staff correspondingly.

The suspended matters in water are living and dead. The dead materials may be organic or inorganic. Although they do not themselves undergo multiplication they may nevertheless play a part in fostering life.

The living matters (algal and other growths), on the other hand, often multiply in water to an extraordinary extent, and as many of them secrete viscous substances, their clogging effect on filters may, apart from questions of taste, become serious.

The dead matters, especially if non-colloidal, tend to settle out in the storage reservoirs, but the living ones may be free swimming, and even the sedentary forms are so easily affected by currents, &c., that they are frequently dispersed throughout the water in a reservoir.

River water contains these living growths, but usually in such relatively small numbers that, in the absence of fresh multiplication, they do not affect filtration to any great extent. It is the dead suspended matters present in excess during floods that are the chief obstacle to the filtration of river water.

Whenever river water is stored in reservoirs the living growths are liable to take on powers of multiplication, although the laws governing their vital activity are but little understood. On the whole, the factors which favour multiplication are light, pabulum, and perhaps stagnation. Hence, shallow reservoirs with dirty, muddy bottoms fed with impure, non-circulating water are apt to suffer more than deep reservoirs with clean bottoms fed with pure circulating water. But questions of temperature, dissolved gases, and many other factors play a part, and those who have had most experience of this subject are apt to be the most cautious in expressing opinions as to the cause at work.

For nearly ten years this matter has been under continual investigation, and for the last eighteen months all the pre-filtration waters (river water, canal water, stored water and mixtures) have been systematically examined.

As regards the method it is convenient to quote from page 4 of my Ninth Annual Report, as follows:—

"The principle is to filter 100 c.c. of the water through a standard piece of linen (four layers) stretched tightly over the end of a glass tube (6 mm. inside diameter) and fixed in position by means of a rubber band. The result is that all the suspended matter (algæ, &c.) in the 100 c.c. is left as a film on the inner side of the linen. The tube with attached linen is then transferred to another piece of apparatus, and tap water, under a constant head, filtered through it for exactly one minute. The filtrate is collected and its volume measured. The greater the volume the better the water is for filtration purposes, so far as the life of a filter is concerned. With a good water the result will be well over 200 c.c., but with an algal-infected water it may be less than 10 c.c."

Since July, 1915, these filtration results have been correlated with the microscopical appearances of the suspended matters by means of photographs.

Briefly, 20 c.c. of the water are centrifuged in special tubes. By appropriate means one-half of the sediment (mixed with 0·1 c.c. of water) is transferred to a small cell cemented on to a slide which is centred under the microscope, and a photograph taken. With a magnification of fifty diameters the photograph shows the suspended matter in what corresponds approximately to 0·5 c.c. of the original water (about 1/20th of the whole field), and in this way a permanent quantitative and qualitative picture of the suspended matter is obtained. Many of the pre-filtration waters show remarkable seasonal fluctuations in quality, and they differ from each other greatly as regards the way they respond to the filtration test.

*Extract from Twelfth Research Report.

MUNICIPAL SCHEMES AFTER THE WAR.

The following particulars of works which municipal authorities are proposing to undertake at the close of the war have come to hand during the present week:—

Aberavon T.C.—The projected schemes include a new cemetery and chapel; the Cwmavon-road improvement; and the laying out of a recreation ground at the beach.

Glyncorrwg U.D.C.—It is hoped to proceed with the completion of the new Avon Valley road, also with a town planning scheme, new roads and sewers, works of improved water supply, and the provision of workmen's dwellings.

Lambeth B.C. The Highways Committee have scheduled a considerable list of road repairs and renewals which have been in abeyance, and the Wharf and Cleansing Committee submit three schemes—viz., the construction of a new jetty and paving work, Providence Wharf, Albert Embankment, £10,000; the reconstruction of buildings at council's stables, Stockwell Green, £15,000; and the construction of new depot buildings and dust destructor, Rommany-road, £34,947. The Public Health Committee propose an extensive schedule of drainage improvements and reconstructions.

Merton U.D.C.—The following schemes have been scheduled: Surface-water drainage improvement scheme for north-west portion of district, £20,000; widening of Beverley Brook culvert at Blagdon-road, £100, main relief low-level sewer from Raynes Park to Collier's Wood, £25,000; widening and improvement of Crown-lane, £1,000; laying out of Abbey Recreation Grounds, £400, storm-water overflow sewer to river Wandle along London and Epsom road, £6,000, surface-water drainage, Watery-lane and Manor-road, £120, making up three private streets, £1,025, improvement of dangerous corners, £2,500; and painting and decorating offices, £40.

Mountain Ash U.D.C.—The council have in hand the plans for a housing scheme, and twenty-five houses will, it is reported, be proceeded with in the first instance.

Neath R.D.C.—The post-war schemes include a new road in the Dylais Valley, estimated to cost £10,000; a new road to connect the Vale of Neath at Glynneath with the Dylais Valley, a town planning scheme, and the extension of the waterworks.

Neath T.C.—The proposed town planning scheme after the war contemplates the purchase of land from various owners. Other projects are new roads in the Llantwit district, and from the Gas-works-road into the town.

The Town Planning of Greater London after the War.

By Professor S. D. ADSHEAD.

[We reproduce herewith the sixth—and last—of the recent series of lectures delivered by Professor Adshead at University College, London. In his previous lectures—extracts from or abstracts of which will be found in THE SURVEYOR of November 17th and 24th, and December 1st, 8th, and 22nd—Professor Adshead dealt with the advantages that would follow a considered scheme for the planning of Greater London, and reviewed existing conditions and outlined the most important of the proposals that have been made up to the present day. In his concluding lecture consideration is given to the ways and means by which all those advantages and amenities can be secured.

The proposals we have considered have not been merely the dreams of idealists, they have for the most part been the essential needs of the community as outlined by practical men.

Nor have they been proposals demanding an immediate expenditure of money; much more can be secured for the future by prevision and strong administrative action, assisted by some little improvement in our legal and administrative machinery, than by the spending of millions to satisfy immediate demands in a hasty and short-sighted way.

Let us then examine the system, if such it may be called, under which the development of London now takes place.

First, then, be it noted that of all the influences at work in the shaping of Greater London the most important are the railway companies and the various authorities responsible for local government. In addition, we must reckon with inherited traditions, habits and customs of the people, many of them obsolete, but which it is necessary to revise if progression is to be the order of the day.

LONDON'S GOVERNING BODIES.

In enumerating the more important of the governing bodies, there should be mentioned:—

First, the London County Council, who exercise a controlling influence over a restricted area, known as the administrative county. Within this area there are the twenty-nine boroughs who, independently of one another, are each responsible for the local government of their different spheres.

Then we have the city authority, financially the most powerful, whose area, buttressed with all the inherited traditions of administrative autocracy, is situated within the very heart of the administrative county, and whose exceptional powers, unlike those of its more youthful neighbours, the borough councils, enable it to act in entire independence of the county authority.

Outside the boundaries of the administrative county we have eighty-two urban and rural councils, each in a modified way submissive to the county authorities of Middlesex and Surrey, but independent of the London County Council, from whom they are separated merely by the very artificial administrative boundary.

Of State Departments, sitting in Whitehall and Westminster, with Parliamentary powers to control the workings of these local authorities, we have the Local Government Board, the Board of Trade, the Board of Agriculture, and the Road Board. These, again, with such restricted powers as they possess, may be said to act independently, and interpenetrating and interfering with the undertakings of this complexity of administrative machinery we have the railway companies, water companies, tramway companies, Trustees of Parks and Crown Property, and a Port of London Authority, who, by Private Acts, hold special privileges which they enjoy without reference to any other governing body.

With the administrative machine handled by so many independent authorities, and without any co-ordinated central authority, is it likely that in the matter of the town planning of Greater London, interests and aspirations common to every citizen and superior to local prejudices can be adequately secured?

NEED FOR A CENTRAL AUTHORITY.

No doubt much has been done, and much can still be done, by conference and negotiation; but, at the same time, there is most certainly needed a central authority capable of grasping and dealing with the whole problem comprehensively, an authority which is backed by, if not actual money grants that would enable it to undertake the carrying out of a big constructive programme, at least a sensible shaking of the money bags of the Treasury.

I have said that much has been done by conference and negotiation, but, with the best intentions in the world, the effect so far of these negotiations has resulted merely in the production of handsome but still-born schemes, and a general feeling of uncertainty, unreality and hesitancy.

I might follow up this reference to the list of authorities responsible with a review of their respective powers. I might dwell at length on the most important of these in reference to town planning. By so doing I might discover many unexercised powers.

It is true that much could be done in regard to the making of arterial roads by a full exercise of the powers held by the Road Board, and I am of opinion that in the Town Planning Act there are hidden away powers that, if adequately exercised, would enable the whole of Greater London to be town planned compulsorily. But where is the local authority, or even Government Department that has the courage, or shall I say the reckless audacity, in view of the public apathy, to take full advantage of the powers possessed. The real difficulty lies not so much in the lack of power as in its distribution, and in the acceptance of the responsibility that its exercise entails.

OBSTACLES TO MAIN ROAD SCHEMES.

As an example, let us take the case of the local authority through whose area it is agreed by the conference of local authorities that an important new arterial road should be constructed. We will assume that the local authority concerned has, with the best intentions, adopted the Town Planning Act, and desires to carry through the road in question. The powers held under this Act provide the means whereby this authority may decide not only the direction but also the width of the proposed new arterial road. Then where is the difficulty? The difficulty lies in the fact that the cost of the difference in width between the width of the road required as a main arterial road and as a by-law road is such as must be borne by that local authority.

How can this be met? Either by successfully negotiating with the landowner so as to obtain his consent to the giving up of the land without cost, or by a grant that through the Road Board can be made from the Treasury; otherwise the cost will fall upon the rates. But the carrying through of all these difficult negotiations is dependent upon the neighbourly sympathy and co-operation of the adjoining local authority, who, possibly not having the same interest in the road, will not undertake the negotiations necessary to the carrying of it through their locality. The reply is that the Local Government Board, convinced, as they no doubt would be, of the necessity of town planning in that area, can force that authority to do it compulsorily. But there is a risk that in doing so the Local Government Board may be faced with a financial responsibility. The Local Government Board cannot meet it, for they have no power to ask the Treasury to make grants for such a purpose, and so, tossed to and fro from owner to local authority, and from local authority to Government Department, the responsibility of carrying out main road schemes is so difficult as to have reached an *impasse*.

LOCAL AUTHORITIES' DIFFICULTIES.

But you would reply that all this question of liability for cost of road construction is not an issue under debate; that what is required is not the necessary funds for the construction of the road, but merely the powers for fixing the line. This is so; and it is also true, as already stated, that the local authority has in the Town Planning Act all the powers that are necessary for fixing both the direction and width of roads. But the difficulties here [illegible] in the case of the most sympathetic and best intentioned of local authorities. First, the [illegible] through whose land the proposed arterial road must pass has to be negotiated with, both in the matter of direction and also ultimate cost of extra width. The [illegible] agree on the first [illegible] but [illegible] the second and [illegible] the [illegible]

Who is going to relieve that local authority of the responsibility it incurs in forcing on the landowner the acceptance of a width, part of the cost of which the local authority may ultimately have to meet?

There might be in the first case a claim for sterilising merely so much of the land as was over the by-law width. That would be immediate, and ultimately there might have to be met the extra cost of constructing a wide road. So, assuming for the sake of argument that the local authority incorporated the road in its scheme, unless satisfactory arrangements could be made with the landowner there would at once be a general claim for the sterilisation of so much of the land as was over by-law width, a claim amounting to the value of such land. It would seem that the liabilities thus entailed should be borne by a higher authority.

Now, having regard to the proved reasonableness of many landowners, and the possibility of getting a considerable amount of the land required without cost, having regard to the interests of many of the local authorities in the making of the roads, having regard to the enormous importance of the carrying through of such an undertaking by London before it is too late, and having regard to the betterment that in most cases would ultimately accrue, the actual cost that would be incurred in ensuring that the land for the roads as generally approved by the conference of local authorities, if it were at once sterilised, would not be great.

The example of Liverpool proves that much can be gained simply by negotiations, provided such negotiations have a solid financial backing, which in the case of a local authority round London in very few cases exists. And why should a local authority provide roads of national interest?

The construction of main arterial roads should be undertaken and financed by a central authority, and whereas in the area of one locality there might be betterment and in the area of another considerable expense, such an undertaking would merely amount to an insurance scheme for local authorities constructing main roads that were promoted nationally.

But no existing Government Department has the necessary power to undertake this specifically. The Road Board can negotiate for land, or contribute to widenings and the improvement or construction of new roads, subject to restrictions, but it is doubtful if they could contribute merely to the cost of sterilisation.

But the construction of main roads, even though the most urgent of the proposals on the town planning programme as we see it to-day, does not satisfy every requirement. This, supplemented with a vigorous application of the Town Planning Act, would do much, but to ensure a full and satisfactory application of this Act there must be enacted legislation which will unify the proposals of railway companies with the considered proposals of town planning, and there must be powers to consider open spaces and the disposition of built-up areas comprehensively. The setting up of a new department empowered to deal with the town planning of Greater London in this way, and which, unlike the Local Government Board which possesses merely the critical faculty, is equipped to make and carry through a constructive policy, is the only satisfactory means whereby the full complement of benefits can be secured.

RAILWAYS AND BUILDING DEVELOPMENT.

In preceding lectures I have shown the importance of quick lines of transit to develop building estates, and I would urge that it is in the interest of railway companies seeking passengers to make their schemes submissive to a central authority for town planning, in order that they may avail themselves of the value of a co-ordinate policy whereby the line of route decided upon may be that best suited to assist building development. No other method will prevent lines of railways obstructing free development or the development of areas which, viewed from a broad standpoint, should be kept open.

It would be a mistake if such a central authority for town planning were to be any one of the existing authorities equipped with the necessary powers. It should be a composite body, possibly representing the interests of the London County Council, the City, the Middlesex and Surrey County Councils, the Local Government Board, the Board of Trade, the Board of Agriculture, and the Road Board.

Its staff would be highly technical, and it should be in a position to command the services of the most highly trained technical experts in the different departments of town planning.

It should have control over the direction of railways and methods of constructing the tracks; it should have control over the construction of main roads and public open spaces; and it should have power to town-plan Greater London in so far as the allocation of areas for residential and industrial development was concerned; and, finally, it should advise the spending of county or State funds on works of metropolitan interest, and which ought not to be locally borne.

The Government is at the moment in the throes of a great war, and it would be extremely injudicious to press upon them now the promotion of such a scheme, but very soon we must be prepared and see to it that the town planning of Greater London is not left to a hundred different authorities, who, with enlightened self-interest, may do remarkably well for their own particular locality, but who are quite unable to subscribe to the improvement and natural development of London as a whole.

We must beware of powers being given to an existing authority that can only take a one-sided view; we must demand the setting up of a real Central Town Planning Board, and nothing less. Now, I think we may take it for granted that no new department will be inaugurated during the period of the war, and meantime the chances of losing what we require are increasing daily, so that any intermediary action on the part of the Government, through an existing department, tending to the sterilisation of areas for roads is to be commended and encouraged.

STERILISATION OF LAND FOR ROADS.

We have shown that the sterilisation of land for the ultimate construction of main roads would necessitate the financial backing of the State. Negotiations with landowners with a view to ascertaining the liabilities entailed in order to sterilise the required main arterial routes generally agreed upon should at once be instituted, and having regard to the disinterestedness of local authorities in certain areas, such negotiations should be encouraged or proceeded with by a Government Department.

Financial assistance offered through the county councils or directly from State funds would ultimately be wiped off as betterment, so that it would only amount to a loan with deferred interest and sinking fund, as already explained.

The greatest difficulty would, of course, be met with in the matter of bargaining with owners, but this would be assisted in many cases by the substitution of an alternative route.

It does not appear to me that there ought to be any real financial difficulty in securing the sterilisation of all the roads proposed by the conference of local authorities, provided immediate action is taken on the lines suggested. Revision could be made after the war and before actual construction commenced.

A greater difficulty would be the prevention of building operations from proceeding in areas which ought certainly to be retained as open land.

CONTROL OF BUILDING DEVELOPMENTS.

When dealing with the future of building developments in Greater London, I dwelt at some length on placing restrictions on areas of development in what is now open country outside the confines of built-up London. I showed that no local authority acting in its own interest and in the interest of its ratepayers would, even with the assistance of the Town Planning Act, be able to control building operations in this way.

Such a considered treatment of Greater London could only emanate from a central authority. I showed also that it was absolutely essential, both in order to preserve the value of existing suburbs as well as to ensure the success of those that were to come, that open land be left around London as it exists to-day.

NATURE RESERVATIONS.

Then there is the question of how to acquire the chain of Nature reservations so essential to the complete equipment of London's recreative areas, and on the lines suggested by the map that has been prepared by the London Society.

A great deal of public education would have to be done before a Government responsible for its interests would undertake the purchase of large tracts of land for this purpose. I believe that the first essential of such undertakings is the education of the public. In due course and when the public have come to realise the value of retaining for ever a chain of Nature reservations round London, these ought to be acquired in several ways.

Town Planning of Greater London after the War	11

A system adopted in many towns of America (and, indeed, we need not go to America for an example, as we have one in Wimbledon) has been to levy a rate on houses in proportion to their proximity to the open area, and when the need has been fully realised and ventilated, much can be obtained in the way of free gifts from landowners, and added to this there should be a contribution from county funds.

HOUSING.

But discourse on the town planning of Greater London that omitted to refer to the housing question is incomplete, for, after all, town planning is but the basis of a great housing and building scheme.

With a deficiency of 300,000 cottages for the working classes, which we are told is no exaggeration of the present needs, which means 1,000,000 people improperly housed, is it to be wondered at that housing, and not town planning, is at the present moment uppermost in people's minds? To expect the public to neglect housing and take up town planning under such circumstances is rather like asking a drowning man to study navigation.

The preparation of a town planning scheme is a long and laborious undertaking, demanding the exercise of considerable imagination; but to seize on an empty piece of ground and at once commence erecting thereon cottages is a direct and easily grasped undertaking.

It is perfectly obvious to me, as it is to most people, that an immediate supply of cottages will never await town planning; but I would point out that if the authorities concerned in the erection of cottages would, without waiting for the necessary permission to prepare a town planning scheme, without waiting for the promised Government grant, commence at once and prepare a comprehensive plan of their areas (they can get plenty of expert advice if they are so inclined), they could then find sites for cottages, which, when time had allowed of the complete development of a detailed town planning scheme, would ensure that, at any rate, they had not made what may be described as a fundamental mistake as regards site.

SURVEYORS AND COTTAGE DESIGN.

It is very likely that we shall shortly have local authorities authorised to prepare schemes for the building of cottages. I presume that if permission were granted the surveyor and his staff, who are certainly not qualified to undertake such work, would at once set about and make the plans.

I sincerely hope that it will not be done in this way. My own view is that what is wanted is a standard cottage, or two dozen standard cottages, prepared by a Government Department in conjunction with the big building trade manufacturers and builders, and with the best architectural advice, and adopted to Garden City principles.

The local authorities, most of whom are quite incapable of preparing a design for a cottage, should only be empowered to adopt these, and that should be a condition of the grant.

I feel very strongly on this point; otherwise leave cottage building to private enterprise and give them where they deserve it financial assistance of a more stable kind.

It is no new idea—villages of standard cottages were erected 100 years ago.

I am aware that the idea of a standard cottage sounds very unwholesome, but we are not living in the Middle Ages. We are living at a time when every individual cannot possibly express himself as he did then. Yet, on the other hand, we will not allow him to be numbered and ticketed till he hardly knows his own door, as he has been in his standard street of last century.

We are, I hope, entering upon what Prof. Patrick Geddes describes as a Neo-Technic Age—an age that realises that wealth and industry are but a means and not an end—and no man's private outlook must be so regulated as that he is nothing but an iron cog in the social wheel.

LONDON'S AMENITIES.

But I can express myself better by a reference. Let me point out the great pioneer example of the Hampstead Garden Suburb; think of all that it means as regards the individual interests of its inhabitants. Think of all the beautiful scenery that to-day surrounds London, its delightful old villages, its forest glades, its wild commons and village greens. With a panorama of all these amenities, than which no capital in the world is better supplied, let me conclude by saying: By all means give every consideration to the economic and scientific development of London, for only by so doing can we obtain physical essentials; but let us not forget the amenities, for only in their provision lies real culture and progression.

But the whole question of town development may seem irrelevant at a time when our vision is dimmed with the circumstances of this great war.

AFTER THE WAR.

It is almost certain that after the conclusion of peace it will be many years before the complete disbandment of soldiers not required for permanent service has taken place. What is to be done with these soldiers in the meantime? In my own view no better occupation could be given them, or, at any rate, such of them as were used to spade work and military engineering, than that of constructing roads. It will be a great pity if nothing better can be found for them to do than occupy themselves with the routine of barrack life.

The difficulties of providing them with useful occupations while under military discipline and supervision are great, but here in road making is an occupation very closely allied to that of their professional duties, and which could be undertaken under the ordinary conditions of military discipline. The supply of material for road construction is another matter; but, at any rate, they could be well employed in cutting, embanking and generally preparing the surface of the ground. This is a matter that might be gone carefully into and urgently pressed upon the Government at the right time.

In conclusion, let me emphasise the enormous importance to the future of London of setting up immediately after the war the sort of administrative machinery that will be able to guide the comprehensive development of London as a whole.

Watch the railways; let me impress upon you the importance of making the question of a new railway line a public one, and do not remain in obscurity until you hear that the thing is done. We must in the future be much more alive to what goes on at the committee stage of the passing of a Railway Bill.

Let me urge on you the importance of educating the general public. I believe that those of you who are engaged in propagandist work are doing greater things than you know. I have spoken of unexercised powers in town planning legislation; by your efforts, and only by your efforts, can legislation—which to-day is unexercised through public apathy, short-sightedness and ignorance—be converted into legislation all the clauses of which are strained.

Fog and Gas Consumption.—The Birmingham Corporation Gas Committee report that a record consumption of gas in the history of the department was, owing to the exceptional darkness due to fog, reached during the week ended December 20th, when the output was 309,000,000 cub. ft. The previous highest total was 296,000,000 cub. ft.

Madras Water and Drainage Works.

A RESTRICTED PROGRAMME: MAINTENANCE COSTS AND ECONOMIES.

When war broke out the Corporation of Madras had in hand water supply and drainage works [illegible] which was £1,500,000. The value of the work executed up to March last was about £800,000, leaving works of a value of about £1,000,000 still to be executed. In order to meet the financial [illegible] which arose after the outbreak of hostilities a restricted programme was prepared. This involves an expenditure of about £330,000, spread over five years, and is so selected as to form part of the comprehensive works which can be completed as soon as funds become available.

It is anticipated that the amount set aside for waterworks will enable a satisfactory supply to be obtained, provided waste and misuse can be reduced. The main works still remaining to be done, and not included in the restricted programme, are seven additional filters, and a waste-water prevention system.

In an exhaustive report which he has recently prepared, Mr. J. W. Madeley, M.A., M.INST.C.E., M.AM.SOC. C.E., the special engineer to the corporation, points out that, except for the works carried out during the last few years, the drainage of Madras is in a thoroughly unsatisfactory condition. The collecting drains, the pumps, and the pumping mains, all require renewal to a great extent, and it, Mr. Madeley says, will be impossible to bring the sanitary condition of Madras to that of a normal healthy city except by carrying out a comprehensive scheme of drainage, such as that which has been sanctioned by Government.

The sum which it is proposed in the restricted programme to spend on drainage works provides for the construction of three new pumping stations and re-engineering of [illegible]. A new pumping main is provided for the western area; this will relieve the present over-burdened southern area pumping main. "New sewers, laid at proper gradients and provided with apparatus to exclude silt, will," adds the engineer, "remove much of the insanitary nuisance that now gives rise to complaints. New gravitation mains will carry the sewage from the sewers to the pumping stations. The nett result should be a great reduction in [illegible] and a considerable improvement in the sanitary condition of the more thickly populated areas of Madras. The works proposed will be in conformity with the comprehensive main drainage scheme, and may be extended as urgency demands and funds permit, until the whole scheme has been completed."

WASTE AND MISUSE OF WATER.

The remarks of Mr. Madeley as regards the prevention of water waste are interesting. In a hot climate like that of Madras the temptation to waste water is very much greater than it is in the West. The restriction of consumption is a very difficult matter, and that this is not the case in Madras alone is proved by the experience of Bombay and Calcutta, where, in spite of very costly works to provide a continuous supply at high pressure, it has been found impossible to apply the full pressure continuously throughout the twenty-four hours.

That [illegible] is a source for great economy is obvious. Mr. Madeley observes: "Even we reflect that probably half the water supply of Madras is either wasted or misused. The installation rules should be enforced without fear or favour. [illegible] work, and the inspectors and assessors who have to carry it out should be given every possible protection and encouragement. The same remarks apply to the house-to-house inspection.

"A further method now in use for checking waste is to reduce the pressure of the water in the pipes, more especially during the hours of least demand. In addition, if it appears that abnormal waste is taking place at any point, the valve between the leading main and the street pipe is closed down so as to limit the rate at which water can be taken. In this manner the waste of water is reduced as much as is possible under present conditions without effecting [illegible] measures.

"In the future, as soon as funds are available, a complete high-service distributing system should be installed, such as is usually found in large towns in England. Recently [illegible] was [illegible] to adopt [illegible] in order to check [illegible] waste of water."

Mr. Madeley furnishes particulars of a twenty-four hours' experiment which was carried out to ascertain the effect of supplying water to the city under full pressure. The main objects of the experiment were: (1) To enable the inhabitants of Madras to form an idea of the pressure at which water could be supplied, if waste were sufficiently reduced; (2) to ascertain what would be the consumption under full pressure; (3) to find out how the pipes would stand the pressure.

HIGH PRESSURE SUPPLY EXPERIMENT.

As a result of the experiment—which would seem to have provided not a little in the way of excitement for the inhabitants—it was found:—

(1) That the water supply system was capable of supplying water to the upper floors of houses all over Madras. Indeed, many tanks on the tops of the houses overflowed, and messages were received from all parts of the city requesting that plumbers should be sent without delay to stop overflows and to remedy other defects that appeared.

(2) That, with the system as it now is, the water taken under full pressure was 23,500,000 gallons per day. As the main part of the system is designed to supply only 14,500,000 gallons per day, and the filters now constructed to supply 10,000,000 gallons per day, it is obvious that the present system cannot supply all the water that would be consumed at the present time under full pressure. Indeed, the present sources of supply, even if all irrigation were stopped, would be inadequate to supply the rate of consumption disclosed by the experiment.

Mr. Madeley suggests that it speaks well for the elasticity of the system and for the work of the staff that it was possible to maintain the full pressure for the whole period of twenty-four hours for which the experiment lasted and even for some four hours longer.

It may be interesting to state that the pressure maintained on the mains was about 50 ft. above ground level, varying from 40 ft. during the hours of maximum consumption to 55 ft. at night. The rate of supply varied from a maximum of 1,420,000 gallons per hour at seven o'clock in the morning to a minimum of 550,000 gallons per hour at night. The latter quantity represents wastage at the rate of 26 gallons per head per day.

(3) As was confidently expected, no failure of the pipes laid within the last few years took place, nor, so far as can be ascertained, did any of them leak. Some of the old pipes burst and in others leaks developed. These were serious in the case of certain 22-in. and 36-in. mains. Service pipes and house fittings also developed a number of faults.

(4) The inter-connection works, recently carried out, proved extraordinarily effective. Although two leading mains 22 in. and 36 in. in diameter had to be cut off, the areas served by them were never deprived of water.

(5) The experiment showed the necessity of overhauling the distribution system. This, says Mr. Madeley, can be done systematically and effectively only when the waste-water meter system has been installed. The necessary valves, meters, &c., are included in the sanctioned estimates, and the system would already be in operation but for the war. At the present time it is impossible to say when it will be possible to proceed with the work.

In the meantime, it is proposed to apply pressure to small sections of the distribution system, and by means of careful inspection and stethoscopic examination to detect the principal faults and then to put them right.

SELF-SUPPORTING WATERWORKS.

Mr. Madeley considers that the question of making the waterworks self-supporting should receive serious consideration. He has no doubt that there are advantages in the community having control of the supply of such a universal necessity as water, but he regards it as highly undesirable that the waterworks should add to the burden of the general taxes. The practice in Madras is to levy a water and drainage tax of 6½ per cent on the rental value of house property and to charge for all water used beyond a certain free allowance where the services are metered. The income from the tax has, however, never been apportioned between waterworks and drainage works, though Mr.

Madeley admits that the larger part should be allocated to drainage, which is unremunerative.

The water pumped at present he puts at 14,000,000 gallons per day, but of this quantity a considerable amount is lost owing to defects in the pipes. To this inevitable waste must be added the water supplied—without charge—for municipal purposes. At present it is impossible to measure this quantity of water, but Mr. Madeley estimates the waste in the street pipes, plus the water used for municipal purposes, as roughly two-fifths of the supply. This is inclusive of water supplied to municipal buildings, pumping stations, &c., but exclusive of water wasted through defective house services and fittings. Deducting two-fifths (5,600,000 gallons), there remains a supply of 8,400,000 gallons per day, which should all be remunerative.

At present the total water paid for is about 4,500,000 gallons per day, so that about 9,500,000 gallons per day is unpaid for.

REMOVAL OF NIGHTSOIL.

In the course of his report Mr. Madeley puts forward a strong plea for the adoption throughout the city of the water-carriage system for the removal of nightsoil. This, he contends, would involve no extra expenditure over the existing system, as the present expenditure on hand removal by sweepers and scavengers would be eliminated. "Moreover," he observes, in conclusion, "sweepers and scavengers are becoming increasingly costly and scarce, and as education extends it will spread such a loathing for scavenger's work as will make the general hand removal of nightsoil on present lines very expensive, if not impossible."

DUST COLLECTION AT SURBITON.

SURBITON'S ELECTRIC VEHICLES.

As stated in our issue of last week, Surbiton, Surrey, Urban District Council have agreed to the purchase, at a cost of £1,025 each, of two electrically

EDISON ELECTRIC DUST-COLLECTION VAN.

propelled dust vans from Edison Accumulators, Limited, Edison Building, 2 and 3 Duke-street, W.

The type of vehicle decided upon by the council is illustrated in the accompanying photographic view. It will be remembered that the committee dealing with the matter reported that with two vehicles and five fillers the whole of the house refuse in the district could be collected once a week, and that after the vehicles were purchased, at the end of three years, the cost of the dust collection would be about £530 per annum less than the cost of doing the work by the present system, assuming the contract price next year, and in the succeeding years, to be 10 per cent more than it is now. In addition, the council would have purchased the two vehicles outright, and would have a depreciation fund at the bank amounting to nearly £600.

Roadmaking in Canada.—Quebec Legislature has voted £1,000,000 for making better roads in the province.

Road Tarring in Somerset.—It was agreed at the last meeting of the Somerset County Council to grant £16,700 for maintenance tarring in rural villages and towns, and £3,400 for surface tarring in urban districts during the coming year, and to make application to the Road Board for a grant towards the cost.

ENEMY PRISONERS AND ROAD WORK.

A SOMERSET COUNTY COUNCIL DISCUSSION.

At the last meeting of Somerset County Council (the *Bristol Times and Mirror* reports) a recommendation was made by the County Works Committee in favour of the employment of prisoners of war on the highways, and that boards of guardians be recommended to provide accommodation for them in workhouses, so far as possible.

The chairman asked if there was any chance of prisoners of war being employed on the roads.

Colonel Kirkwood said he was afraid not, unless they got the money to reconstruct roads. They might be used in quarries adjacent to their roads.

Mr. Somerville said they were informed that there were no prisoners available.

Mr. Lean said he had had experience of Austrian Bohemians, and a better class of man they could not get. They would not run away, and he hoped they would be sent to the country districts, as they could be usefully employed on the land.

Mr. Somerville: I am talking of prisoners of war.

Mr. Lean said some military prisoners had been brought up on the land.

Mr. Kidner: I am told that there are practically none fit to go on the land.

The report was adopted.

RUSSIA'S MUNICIPAL SERVICES.

FIELD FOR BRITISH ENTERPRISE.

Russia as a field for British enterprise and for the employment of British capital is (says a writer in the "Russian Section" of the *Times*) attracting the attention of our manufacturers and financiers to an extent never known before in the commercial history of this country. The war is, of course, responsible for this awakened interest, and for the mutual desire of the Russian and British Governments and peoples to witness, when peace is concluded, a preferential exchange of trade between the two nations. Russia does not want to "replace Germany" by Britain or by any other country. She has endured German domination of her industries and commerce long enough *not* to desire to see any other nation installed in Germany's place. What Russia does desire is a single-minded co-operation by the British in the development of her limitless natural resources. She will welcome with open arms the assistance of British capitalists, manufacturers, and merchants in this gigantic task.

The tremendous scope for development may be gauged from such statistics as are available in regard to the equipment of the 1,231 municipal areas in Russia. Of these only 162 are lighted by electricity, 128 by gas, while 1,028 depend upon the kerosene lamp. In respect to other services, 219 municipalities have a system of aqueducts; 65 only have a main drainage system; 54 a service of tramways; 32 only are equipped with telegraphs, and 314 with telephones.

In addition to these administrative municipal areas there are large numbers of so-called villages with populations of from 20,000 to 30,000. All these towns and villages will begin to demand the same municipal services and amenities as the returned soldiers have seen to be regarded as indispensable among other communities, and in this work of social progress British engineers and manufacturers ought to take no little share.

New Municipal Buildings at Coventry.—The new municipal buildings at Coventry, which have been built at a cost of about £60,000, have been completed, and as the furnishing proceeds they will be occupied by the several departments of the corporation. The street frontages are carried out in Runcorn stone, with roofs of Cotswold stone, in the style considered best to harmonise with the surroundings and the ancient traditions of the city. The frontage to St. Mary's Hall is in brick and stone, in the designing of which the foregoing considerations have been taken into account. The building has a frontage to Bayley-street of 275 ft., to St. Mary's-street 116 ft., to Hay-lane 53 ft., and facing St. Mary's Hall of a frontage of 270 ft.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Was not the city of New York on right lines when it recently published an article stating that the man of the future will be "the man who can do things," and not the mere talker or politician, and that this man who can do things is to be found in the engineer? Is it not evident that the war has emphasised this opinion, and that the world will some day realise that the really useful man is the one who is capable of creation and organisation, and not the lawyer or the politician, who, as a rule, are prone to keep things back instead of pushing them forward? Have we not to thank the legislation of the past for many checks upon engineering progress?

* * * *

Has the question yet been definitely decided as to how long it is necessary to keep the traffic off a newly constructed concrete road so as to allow it to consolidate properly? Is the accepted time of three weeks sufficient, or is this period found to be too long in practice? Does it make any difference in the required time if the concrete is "fat" or "lean"? Does the quality of the cement affect the question? Do not the weather conditions make a considerable difference? Are not these and other questions some of the things one would like to know?

* * * *

When will a powerful "Utilisation of Waste Products Company" be formed to deal scientifically with house refuse? Is it a fact that New York has recently entered into a contract with such a company to deal with an average quantity of 1,300 tons a day of house refuse, and that the plant to be erected will be capable of dealing with 2,000 tons a day, on the most scientific lines and without causing the slightest nuisance? When shall we see London and other large cities in this country dealing with their refuse in a scientific and common-sense method instead of, as at present, wasting so much valuable material?

* * * *

Does not the United States Department of Agriculture set us a good example in their education of farmers by giving them detailed information on such subjects as obtaining water by rams or wind engines, &c., by advising them as to the sanitary requirements of their houses and farmsteads, the construction of their farm buildings, and the generation of power, as well as on a host of other matters on which it is to be feared most of our farmers are entirely ignorant? Would it not be an excellent thing if our Board of Agriculture could arrange something of the same kind for the instruction and assistance of the farmers of this country?

* * * *

Is it a fact as stated by Councillor Barrow at a recent meeting of the Town Planning Institute, that the average number of new houses annually required in this country is about 100,000, and that during the past two years only 10,000 or 20,000 have been erected? If this is so will there not be an enormous shortage of houses after the war? How is this shortage going to be met?

* * * *

Why cannot the wear and tear of the roads and railways in France and elsewhere at the seat of war be relieved by the construction of aerial lines or "air tramlines," as they are sometimes called? Could not the example be followed of a certain salt mine in California, where formerly the salt was carried in waggons over roads which became almost impassable from this traffic, and the journey took thirteen days, whereas now, by means of an aerial line, the salt is conveyed in larger quantities at about one-tenth of the cost and the journey only takes two and a-half hours? Cannot the engineers attached to our Army devise some such means of transport, and thus divert some, if not all, of the enormous traffic which is now so seriously affecting the condition of the roads and railways?

* * * *

Now that the name of Abraham Lincoln, the sixteenth President of the United States, is so prominently before the public, is it not interesting to find that, at one period of his life, he was something of a road engineer? Is it generally known that a Mr. Calhoun, a county surveyor, offered to take Mr. Lincoln to be examined, and that "Honest Abe" who was then the postmaster of the little hamlet of Salem, at once began surveying and levelling, and became Mr. Calhoun's assistant? Does not this go far to prove that the training of an engineer fits a man for almost any position in life?

* * * *

Is there anything in "nitro-energy," which, according to an American mining engineer, is to be the power of the future? Does it not read almost like a fairy tale when he states that with the apparatus he has invented "1 ton of nitro-energy is equivalent to 1,300 tons of coal, and is safer than petrol"? All this may be true theoretically, but can any practical use yet be made of the nitrogen which is in our atmosphere, and have not many attempts been made from time to time to harness this great natural force?

SHEET STEEL FOR STREET PAVING.

A town in the United States, Charlotte, North Carolina, is experimenting in the use of steel sheets as a paving surface. On one of its streets a roadway 7 in. thick is being built, consisting of a macadam base 4 in. in depth, covered with 3 in. of concrete. A wearing surface of steel plates is used which measure 18 ft. long, 30 in. wide, and ¼ in. thick. Trapezoidal-shaped perforations, 2 by 1½ by 1¼ in. in size, are placed throughout the plate at 1 to 1½ in. intervals. The shorter side of each perforation is uncut, and the metal is bent down to form a projecting lug on the under side. Connection between

Steel Sheets Laid in Concrete in Experimental Paving.

adjacent sheets is formed by fitting tongues on one side of one sheet into slots in the opposite side of the other sheet.

The steel sheets were placed in position and tamped to a solid bearing, with the tops flush with grade. Each steel sheet was joined to the one already placed by raising the outer edge and slipping the tongues of the new sheet into corresponding slots of the other plate. The new sheet was then lowered, and at the same time pushed close to the other sheet. A space of about ¼ in. was left between adjacent sheets.

Actual cost data on what has been done shows a unit cost of 8s. 6d. per square yard.

Flies and Food Contamination.—At a meeting of the Royal Sanitary Institute to be held at St. Helens Town Hall on Saturday, February 17th, Dr. Joseph Cates will open a discussion on the subject of measures to be taken to prevent contamination of food by flies. The chair will be taken at 10.30 a.m.

"THE SURVEYOR" SPECIAL ISSUE.

The Special Annual Issue of "The Surveyor" will be published on January 26th, and readers who propose to accede to our request for a short statement, for inclusion in the number, of the works projected by their authorities for 1917, will greatly oblige by making their return as early as possible. All other material, and particularly matter accompanied by illustrations, should likewise be forwarded without delay to ensure its appearance.

Municipal Work In Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars have reached us during the present week. Other reports will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Carlisle T.C.—It was reported to the Health Committee that the town clerk had laid before a special meeting the opinion of Mr. A. Macmorran, K.C., on the case he had submitted to him with reference to the claim of the Central Control Board (Liquor Traffic) to be exempt from compliance with the provisions of the different Acts and by-laws in force in the city with regard to new buildings, and that it had been resolved, in the circumstances, that no further action be taken.

Chorley T.C.—The borough surveyor, Mr. G. H. Hopkinson, has received instructions to report upon a proposed scheme of improvement of the council chamber.

Falmouth T.C.—A letter has been received from the Falmouth and Truro Port Sanitary Authority asking the corporation to appoint two representatives to a conference on the subject of a proposed small-pox hospital.

Halifax T.C.—The question is under consideration of providing central offices for the gasworks and electricity departments.

Rothwell U.D.C.—The council have adopted the suggestion of the county surveyor that each of the three authorities concerned in the repair of Newbottle Bridge—viz., the Kettering Rural District Council and the Desborough and Rothwell Urban District Councils—should bear a third of the cost.

Spenborough U.D.C.—It has been decided to appeal to the inhabitants for a subscription of £500, representing the proportion required for the district towards £6,000 wanted for the adaptation of the Dewsbury Union infirmary as a base hospital for wounded soldiers. The Local Government Board have ruled that the expenditure cannot be charged to the rates.

Tamworth T.C.—The town council are appealing to the Local Government Board for authority to purchase property in Upper Gungate for the erection of a new school.

HOUSING AND TOWN PLANNING.

Doncaster T.C.—Authority has been received by the town council for the preparation of a town planning scheme for Armthorpe and Kirk Sandall.

Dudley T.C.—The whole question of a housing scheme for Netherton is recommended by the Public Works Committee to be referred to the Housing Special Sub-Committee for consideration and report.

MOTOR TRANSPORT.

East Grinstead R.D.C.—It is proposed to convert one of the steam rollers into a traction engine for the purpose of hauling road materials.

Harrogate T.C.—The corporation have purchased a 3-ton Daimler chassis, fitted with a tipping frame and interchangeable lorry and tank bodies. The iron tipping frame is fitted with hand tipping gear, by means of which a tipping angle of 40 deg. may be obtained. The tipping frame, complete with the frame-shaped lorry body, was supplied by Messrs. Lockwood & Clarkson, Leeds. The tank, which has an approximate capacity of 650 gallons, is built of mild steel, and mounted on an underframe of English oak fitted with Messrs. Wadsworth's improved springs.

Portsmouth T.C.—The corporation have accepted the tender of Messrs. Foden, of Sandbach, for the supply of two steam motor wagons, at £800 each.

Rotherham T.C.—It has been agreed to purchase a two-seater motor car for the electricity and tramway department.

Tynemouth T.C.—The town council, having failed to obtain authority for a loan, have resolved to purchase a motor fire engine and other fire appliances out of revenue, at a cost of £1,500.

REFUSE COLLECTION AND DISPOSAL.

Birmingham T.C. The Public Works Committee have effected the purchase of land and buildings in Grove-road, King's Heath, for £1,800. There is a large clay pit on the property, and it is intended to make use of this for tipping house and street refuse.

ROADS AND MATERIALS.

Aberdeenshire C.C.—The road surveyor, Mr. Nicol, reported to the Huntly District Committee that a great deal of damage had been done to the district roads by heavy timber hauling. The chairman, Mr. R. H. N. Sellar, stated that if the war were to continue much longer it would become a serious matter for them to keep their roads in proper repair, and it would mean a very large expenditure of money. Mr. Wilson: If the war is to continue much longer, let us get the Germans to keep the roads in repair. The committee decided to confer with the parties responsible for the damage with a view to obtaining compensation.

Argyll C.C.—The council have resolved to borrow £4,000, free of interest, from the Road Board for the Ballachulish-Kinlochleven road.

Barnard Castle U.D.C.—Plans have been approved for widening the main road near the workhouse, at an estimated cost of £220.

Birmingham T.C.—With respect to the proposed improvement works in Drews-lane, which are estimated to cost £7,481, the Road Board have agreed, subject to the sanction of the Treasury, to lend the corporation £6,481 free of interest, the repayment to be spread over five years. The Government have already promised a contribution of £1,000 towards the cost of the scheme.

Bispham U.D.C.—A sum of £300 has been estimated for the repair of Blackpool-road, and the council are seeking for authority to incur expenditure in repairs to Red Bank-road.

Crediton R.D.C.—Notification has been received from the county council of their intention to take over the 64 miles of main roads which have hitherto been repaired and maintained by the rural council. The roads will be taken over as from March 31st next. The question of the conditions of the appointment of the surveyors, Mr. S. Pridham and Mr. L. E. Sharland, as affected by the altered circumstances was considered, and, in order to put the matter on a proper basis as it may arise on March 31st, it was agreed formally to give them three months' notice to terminate their appointments.

Greenwich B.C.—It is proposed to make up Bishop's-buildings, Thames-street, as a new street, at an estimated cost of £350.

Hailsham R.D.C.—Tenders for steam rolling have been accepted at 27s. per day, all inclusive, for the districts of Hove and Ninfield, and 30s. per day for the remainder of the district. An intimation has been received that the Road Board have agreed to pay £720 towards the cost of the repair of roads damaged by military traffic.

Taunton R.D.C.—The surveyor, Mr. T. G. Crump, has submitted an estimate for road maintenance for 1917-18 amounting to £4,059.—The council have decided to apply for a contingent of German prisoners for quarrying and breaking stones.

SEWERAGE AND SEWAGE DISPOSAL.

Birmingham T.C.—The Public Works Committee are advised that the condition of a length of the Hockley main sewer is giving rise to serious apprehension. The sewer is egg-shaped, 5 ft. 9 in. by 3 ft. 6 in., and is in parts threatened with collapse. It is essential that the length between Avenue-road and a point about 80 yds. below Thimble Mill-lane should be forthwith reconstructed. Detailed estimates of the works immediately necessary are in course of preparation, and these will probably amount to about £12,000. It is recommended that, subject to the consent of the Ministry of Munitions and the Local Government Board, the necessary works of reconstruction be carried out.

Blean R.D.C.—The engineer and surveyor, Mr. F. A. Ward, submitted the apportionment of expenditure on the Herne and Reculver sewerage and sewage disposal

a loan between the two parishes. This was as follows: Heene £14,758; Rogalvet £5,713. The loans granted were: Heene £10,578; Rogalvet £5,362. The additional loans refused were: Heene, £180; Rogalvet £351.

Chorley T.C. The Sanitary Committee have received authority to carry out sewer reconstruction in Hindley street.

Clutton R.D.C. The Local Government Board have sanctioned the council's application for a scientific report on the question of preparing and submitting sewerage schemes for the parishes of High Littleton, Paulton, Farmborough, and Timsbury in order to avoid unnecessary delay in proceeding with the work when the restrictions upon borrowing are withdrawn.

Nuneaton T.C. The town council are recommended by the Sewerage Committee to apply for a loan of £5,000 for sewerage works in the Coton road district, and £1,700 for completing the conversion of the contact beds into filters at Hartshill.

WATER, GAS, AND ELECTRICITY.

Aylesbury U.D.C. It is proposed to relay an electricity main at an estimated cost of £150.

Barking U.D.C. It has been decided to take up a loan of £5,000 for electricity mains extensions.

Barrow T.C. The town council are promoting a Bill in Parliament to increase the quantity of water which they are authorised to take from the river Duddon and its tributaries.

Bedford T.C.—The town council are considering recommendations by the electrical engineer for electricity extensions, including the installation of new plant, estimated to cost £35,000.

Eastbourne T.C.—It was reported on Monday that, owing to the large increase in the price of coal, and a diminution of the consumption of private and public light, there was a deficiency of £1,200 upon the working of the electricity undertaking during last year.

Glasgow T.C.—In connection with the decision to complete the new generating station of the electricity department at Dalmarnock, the Secretary for Scotland has sanctioned the borrowing by the corporation of a further sum of £500,000 for the execution of capital works, raising the total sum authorised to be borrowed for that purpose to £3,000,000.

Halifax T.C.—The Water Committee propose to effect various water main extensions, at an estimated cost of £9,000.

Hereford T.C.—It is now stated that the proposed extensions to the electricity undertaking will cost approximately £63,300, instead of £45,000 as originally estimated.

Llandudno U.D.C.—The electrical engineer has been instructed to report on the provision of a battery available for small loads.

Luddenden Foot U.D.C.—An agreement has been entered into with the Halifax Town Council for a supply of electricity for street lighting.

Middlesbrough T.C.—The town council last week resolved to borrow from private sources £125,000 for waterworks purposes.

Morecambe T.C.—The Gas Committee recommend the council to instal mechanical stoking plant at the gasworks.

Nottingham T.C.—The town council on Monday last adopted a recommendation of the Gas Committee to increase the price of gas for power and gassing purposes.

Nuneaton T.C.—The Water Committee recommend the installation of a water-softening plant at Griff, at a cost of £1,281 and the provision of new distributing mains at an estimated cost of £1,200.

Rotherham T.C.—Dr. Houston, of the Metropolitan Water Board, has been asked to report on the utilisation of the water at Ulley.

Southend T.C. The provision of two 750 kw. steam generators at Chalkwell Park is being considered by a sub-committee.

West Ham T.C. The Electricity Committee recommend the town council to instal a turbo-generator of 30,000 kw. capacity, at a cost of £19,745, and also a battery of 2,000 kw. capacity at a cost of £12,000.

Wivenhoe U.D.C.—It has been agreed to purchase a Diesel oil engine and starter, at a cost of about £300, for the waterworks.

Worthing T.C.—The town council on Tuesday resolved to increase the charges for electricity from 10 to 30 per cent on pre-war charges, with the exception of slot meters.

MISCELLANEOUS.

Bristol T.C. The Sanitary Committee have agreed to the proposal of Sir George R. Asquith, Chief Industrial Commissioner, that the matter of the wages of the road sweepers and ashmen should go to arbitration. The request of the men was that their wages should be regulated by the trade union rates, and in this connection it was reported that the wages of builders' labourers averaged 31s. 9d. per week for full time all the year round, but that in normal times they lost a sixth, which made their average weekly wages 27s., and for the four winter months 26s. 2d. A sub-committee decided that they were unable to grant the request. At the same time they would continue to keep the actual average earnings of the sweepers to the amount at least of the actual average earnings of the builders' labourers working according to the trade union wages and conditions as agreed by the employers and workmen of the Bristol district.

Midhurst R.D.C. It has been agreed to grant a war bonus of 2s. per week to employees engaged in road maintenance.

Worthing T.C.—The General Purposes Committee reported that Councillor Jackson had submitted a suggestion to experiment on the foreshore with a view to increasing the deposit of dry sand by means of low terraces of planks to be erected between groynes below high-water mark. It was resolved that a sub-committee be appointed to consider the proposition, and that an experiment be made if deemed advisable, at a cost not exceeding £30.

PERSONAL.

Mr. John Morgan, who has been acting as deputy surveyor, has been appointed surveyor to the Blaenavon Urban District Council.

Mr. W. Hayne, of Frinton, has been appointed surveyor and inspector to the Walton-on-the-Naze Urban District Council for the duration of the war.

Mr. J. Macdonald, Kingussie, has been appointed interim road surveyor to the Badenoch district of Inverness-shire during the absence of Mr. Grant on military service.

Mr. Lionel D. Lewis, engineer and surveyor to the Abertillery Urban District Council, has accepted a commission in the Road Service Battalion, attached to the Royal Engineers.

Mr. Ernest A. Mills, ASSOC.M.INST.C.E., of Birmingham, was on Wednesday appointed chief engineering assistant in the electricity department of the Leeds Corporation, at a salary of £350 per annum.

Mr. James Johnson, borough surveyor of Rawtenstall, has accepted the position of Captain in one of the companies now being formed by the county surveyor of Lancashire for road service in France. Mr. Percival Holt, chief assistant to the borough surveyor, will act as deputy during Mr. Johnson's absence.

OBITUARY.

Mr. Edgar Collins, deputy surveyor to the Mynyddislwyn Urban District Council, died recently, we regret to state.

Mr. F. E. Weaver, for over forty years surveyor, first to the Gloucester Highway Board and then to the Gloucester Rural District Council, died last week, we regret to report. He was seventy-four years of age, and during his final illness remarked that, until the last meeting an December 11th he did not think he had missed a meeting of the above-named authorities since 1872. He leaves a widow, two sons, and two daughters. One of his two sons is Mr. Henry J. Weaver, M.INST.C.E., of Gloucester.

Prevention of Cellar Flooding.—Much inconvenience is annually caused to those who possess a cellar and cannot use it on account of winter flooding. A case in point is the cellar of the Hope and Anchor Inn at Hanworth, Middlesex, which was formerly flooded every year to a considerable depth. In the summer of 1913 it was decided to prevent this continual nuisance and a treatment of Pudlock cement was given to the floor and walls. We learn that the cellar has been perfectly dry since, and is now used for storage in both winter and summer.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRY HELD.

Cork R.D.C. (December 20th. Mr. A. D. Price).—£1,000 for the improvement of the water supply to Passage West, Glenbrook, and Monkstown.—The money, it was stated, was required in order to improve the Parkgarriffe supply and prevent the influx of surface water and other deleterious matters. About 2,000 people were depending on that water supply, and the council's rent roll from that supply of water was about £280 per annum. The council had samples of water from that supply analysed, and the analyst's report was as follows: "This water, in its present condition, is loaded with organic matters, mostly of vegetable origin; the reservoirs need very badly to be cleaned, and filter beds need renewal. As regards quality, there is very little difference between this sample and the sample taken from the Pembroke supply. In its present condition this water must be ranked of moderate quality among second-class waters. Its constant use for drinking cannot be recommended." Mr. B. O'Flynn, engineer to the council, gave particulars of the scheme that he had prepared. The scheme would supply water to 2,000 people, and would give them 20 gallons per head each day.

APPLICATION FOR LOAN.

Arklow U.D.C.—£1,000 for the completion of the housing scheme.

LOAN REFUSED.

Aldershot U.D.C.—£1,000 for public conveniences.

LOANS SANCTIONED.

Blackburn T.C.—£5,000 for the installation of a tar-distillation plant at the gasworks.

Greenock T.C.—£6,000 for the gas undertaking.

Preston T.C.—£500 for shingling at the Alston reservoir.

New Houses in Manchester.—The number of new dwelling-houses in Manchester certified as fit for human habitation in the year ending October, 1916, is the lowest on record. It amounts to 119, as against 410 in 1915, 782 in 1914, 563 in 1913, 615 in 1912, 964 in 1911, 1,590 in 1910, and 2,344 in 1909. In the ten preceding years the average was over 2,000.

FOR OTHER ADVERTISEMENTS
See End of Paper.

BOROUGH OF AYLESBURY.

Applications are invited for the appointment of Temporary Surveyor's Assistant, subject to a month's notice on either side.

Applicants must be ineligible for military service, a good Draughtsman and Surveyor, and should have had experience in a Municipal Engineer's Office.

Applications, stating age, experience, salary required, and when able to commence duties, accompanied by copies of three recent testimonials, to be delivered at my Office not later than Tuesday, January 23rd, 1917.

WM. HAROLD TAYLOR.
Borough Engineer and Surveyor.

Town Hall, Aylesbury.
January 5, 1917. (3,225)

WANTAGE URBAN DISTRICT COUNCIL.
TEMPORARY SURVEYOR, INSPECTOR, AND COLLECTOR OF RATES, &c.

The Council invite applications for the above appointment during the absence of their Surveyor, Inspector and Collector on military service. Population, 3,628; acreage, 2,478 acres; mileage of main and district roads, about 9½ miles. Total salary, £2 5s. per week.

Applicants must be ineligible for the Army, and must hold the Certificate of the Royal Sanitary Institute.

Applications, accompanied with copies of two recent testimonials, to be forwarded to me not later than the 10th instant.

EDWD. B. ORMOND.
Clerk.

Wantage.
January 2, 1917. (3,227)

WANTED, Temporary Assistant, for short period, ineligible for Army, able to level, good draughtsman, tracer, &c.; keep wages and other surveyor's accounts, and be experienced in routine duties of surveyor's office.

Wages, 30s. per week. Applications, in own handwriting, stating experience, with copies of three recent testimonials, to be sent to the undersigned.

B. MORLEY,
Borough Surveyor,
(3,224) Tenby.

BATTERSEA BOROUGH COUNCIL.
TO CONTRACTORS AND OTHERS

The Council invite Tenders for the following from the 1st April next:—

1. Veterinary Attendance.
2. Horse Hire.
3. Supply of Materials for Cart and Van Covers.
4. Supply of Harness Material and Fittings.
5. Supply of Paints, &c.
6. Supply of Special Paints, Enamels, &c.
7. Supply of Painters' Sundries.
8. Supply of Varnish, &c.
9. Supply of Tools, &c.
10. Supply of Ironmongery, &c.
11. Supply of Granite, Macadam and Chippings.
12. Supply of Tar-macadam, Tar Paving, &c.
13. Supply of York Paving.
14. Supply of Thames Ballast and Sand.
15. Supply of Stoneware Pipes.
16. Supply of Timber, &c., for Carpenters and Joiners' Work.
17. Supply of Timber, &c., for Wheelwrights' Work.
18. Supply of Bricks, Cement, Lime, Slates, &c.
19. Supply of Iron Castings (Side Entrance Covers, &c.).
20. Supply of Iron Bars, &c., for Blacksmiths' work.
21. Removal of House and Street Refuse and Manure from the Council's Stables.
22. Supply of Disinfectants.
23. Supply of Coal and Coke.
24. Supply of Soaps, Oils, &c.

Forms of Tender, containing full particulars, may be obtained at the Town Hall, between 10 and 4 (Saturdays 10 and 1), or by sending me stamped addressed envelope under cover, endorsed "Tender Form," and no Tender will be considered unless made on such Forms.

Tenderers must pay the Trade Union rate of wages in all departments. Tenders, in separate envelopes, sealed and marked on the outside "Tender for ——," must be delivered to me by 3 p.m. on Wednesday, 24th January next, together in the cases of Nos. 11, 13, 14 and 15, with Samples, carriage paid.

W. MARCUS WILKINS,
Town Clerk.

Town Hall, Battersea.
January 4, 1917. (3,229)

OTLEY URBAN DISTRICT COUNCIL.

The above Council are prepared to receive Tenders for the following Materials for the year ending March 31st, 1918:—

1. Setts, Kerbs and Flags.
2. Granite Macadam.
3. Pitch and Tar.
4. Slag Dust.
5. Tar-macadam.
6. Limestone Macadam.
7. Brushes.

Specifications and Forms of Tender can be obtained from Mr. O. Holmes, Surveyor to the Council, and to whom the Tenders must be sent not later than Wednesday, the 31st day of January, 1917.

The Council do not bind themselves to accept the lowest or any Tender.

C. J. F. ATKINSON,
(3,226) Clerk.

CIVIL ENGINEER AND SURVEYOR, ten years' experience, desires spare time employment: tracings, &c., neatly executed; edging and colouring carefully done; terms moderate.—Box 1,597, office of THE SURVEYOR, 24 Bride Lane, Fleet Street, E.C. (4,228)

NEW WATER SUPPLY AND OTHER MUNICIPAL WORKS AT WATFORD.

It will be recollected that at the meeting of the Institution of Municipal and County Engineers held at Watford on October 7th a paper descriptive of the new water supply and other municipal works of that town was presented by the engineer and surveyor to the urban district council, Mr. David Waterhouse. The gathering was reported in our issues of October 13th and 20th, but our account of the discussion which took place did not include Mr. Waterhouse's reply to the numerous questions which were put to him in the course of the proceedings. As we stated at the time, it was arranged that this should be furnished in writing, and it has just been made available in the Institution "Journal" for December, in which the official report of the meeting appears.

Mr. Waterhouse, in answering the many questions asked by the members, has found it more convenient to group his replies under the headings of the subjects in the order in which they appear in the paper.

Water Consumption.—In reply to Messrs. E. Y. Harrison, Bennetts and Marshall, the consumption of water was 25 gallons per head per day, and the actual waste in this amount was considerably less than 7 gallons per head per day. The Deacon waste detection meter system was the one which they had in operation, and the water supply area was laid out in fourteen waste inspection districts.

With regard to the washering of the taps, the water inspectors always carried a supply of washers, and they were put on free of charge.

Electrical Turbine Pump.—In reply to Mr. E. Y. Harrison, the electrical pump was of the turbine type, and no violent alterations of pressure were possible, unless, of course, a very large draw-off of water took place either on the inlet or outlet side of the pump. Such changes of pressure would not be due to the pump itself, for as long as this runs at the same speed the pressure remains constant between the suction and delivery sides, so that no trouble can possibly be experienced when using a pump of this type for this purpose.

Wells.—In reply to Mr. R. S. Henshaw, the rising columns were suspended directly from a flange arranged inside the pump-head. The top end of each rising column was fitted with a special cast-steel supporting piece provided with lifting rings, the opening in the pump head was made sufficiently large, whereby the flanges on the rising column may easily pass through. No other support was provided, so that the whole weight of the rising column was taken in the manner explained, and at any time can be easily withdrawn.

The rising columns were made of lap-welded steel pipes having the flanges welded. They were grummeted and the flanges faced and turned in the lathe, so that all the pipes being machined perfectly true at their connections, no difficulty was experienced in keeping them vertical.

The distance from the engine-house floor to the end of the suction pipe was 157 ft. 3 in., but the whole of the pump-work was made strong enough so that, should it be necessary, it would be possible to lower this and obtain a maximum lift of 300 ft.

In reply to Mr. Collins, the false bottom of the lining tubes was fixed on the bottom of the tubes, and was composed of three layers of wood sufficiently strong to withstand the water pressure for the depth. After the tubes had been sunk to the required position, the wood bottom was broken out with the chisel, the pieces floating to the surface. The annular space between the tubes and the chalk was filled with cement let down by a funnel pipe after the tubes had been driven into the solid chalk to the required depth.

Pumping Plant.—In reply to Mr. Harrison and Mr. Wakelam, the actual cost of fuel for raising 1,000 gallons of water 100 ft. was not yet available, but, estimating coal at £1 per ton delivered at the pumping station (from which the cost for other prices of coal would be directly proportional), and allowing for the steam through the engine cylinder and jackets, and the necessary fuel used in banking the boilers overnight, the cost of coal per 1,000 gallons of water raised 100 ft. was 0·45 of a penny.

Under the specification in the contract, the makers guaranteed a steam consumption of not more than 11½ lb. for steam passing through the engine cylinders per pump-horse-power per hour, with the condensation from the cylinder jackets in close circulation.

In reply to Mr. Collins, the effect of cutting off the steam in the intermediate and low pressure cylinders necessarily causes back pressure on the high and intermediate cylinders respectively, and the object of the cut-off valves on the intermediate and low pressure cylinders was to enable these back pressures to be controlled, and so reduce free expansion to a minimum when the exhaust valves were opened to the exhaust and whereby the maximum useful work was obtained from the steam, and consequently the highest possible economy.

The compensating device is fully explained in the paper under the heading "Pumping Plant."

In the event of a burst main, the hydraulic accumulator operates in conjunction with the compensating device; the top cylinder of this was in direct communication with the delivery main, and immediately the pressure in the delivery main falls, from whatever cause, the pressure in the oscillating cylinders was at once reduced, destroying the compensation in proportion to this reduction, and the engine at once shortened the length of the stroke and was prevented from running away or doing itself any damage, as would most likely happen in the case of a flywheel engine which was not properly controlled.

In reply to Mr. Marshall, as stated in the paper, there were two complete engine sets, one of which would always act as a stand-by.

Water Softening.—In reply to Messrs. Wakelam and Harrison, the pre-war estimated cost of softening, based on the cost of lime at £1 per ton, and including maintenance and labour, but excluding any capital charges, was ¼d. per 1,000 gallons. The estimated amount of lime required was 1½ lb. per 1,000 gallons, but this amount may vary with the character of the water and the quality of the lime.

The pressure available for cleaning the filter cloths was the old reservoir pressure of 62 lb., but this pressure would be considerably increased with the new reservoir. The cleaning of a filter was done in one operation, which occupied about three minutes. The average life of a filter cloth was about twelve months.

In reply to Mr. Collins, the water passing through the inlet to the filter was deflected to the bottom of the tank, and, rising up between each plate, ensures uniform filtration.

In reply to Mr. Henshaw, it is not the intention at present to convert the deposit from the softening plant into quicklime.

Reservoir.—In reply to Mr. Wakelam, the pre-war estimated cost of the 2,000,000-gallons service reservoir, exclusive of the cost of land, was £12,100.

Sewage Discharge.—In reply to Mr. Marshall, the discrepancy between the amount of sewage discharge and the water consumption was explained by the fact that the waste from three large breweries, which have their own water supply, and also a certain amount of rain water from roofs at the rear of houses, was discharged into the sewers.

In reply to Mr. Wakelam, the sewage farm is in the area under the control of the Thames Conservators, and is visited by their inspectors.

Cardiff-road Sewage Pumping Station.—In reply to Mr. Willis, the static head on the sewage pumps at the Cardiff-road pumping station was 56 ft. When the screening tank at this station was cleaned out the sludge was gravitated to the low-level ejectors, which send it forward to the high-level ejectors at Willow-lane, and on to the farm.

Ejector Station.—In reply to Mr. Marshall, the alternating valves were put on the Willow-lane ejectors because they were not able to deal with the sewage as it came down to that station. The estimated additional quantity dealt with since the alteration was made was 25 per cent of the volume raised. The advantage of the alternating arrangement was that the work was continuous and not intermittent, and the air main and sewage delivery main were utilised to their fullest capacity.

Destructor.—In reply to Messrs. Harrison, Collins and Cutler, the coal bill for sewage pumping in 1903, when the destructor was built, amounted to £740 per annum; the population at that time was about 33,000.

In earlier years when the destructor was shut down for week-ends when they had no refuse, and quarterly when it was shut down for cleaning, they turned over on to coal-fired boilers; but in recent years, by an arrangement, they obtained steam from the electricity department. In the event of destructor steam failing this supply was

always available, but they could at any time go back to coal-fired boilers, one of which had been retained.

In working the destructor they were helped considerably in past years by a refuse heap near by, from which they obtained fuel when they ran short from the town; this was especially useful in summer-time, when refuse was of less calorific value than in the winter. They had never used coal in the destructor.

The war had considerably affected the quality of the town refuse, its calorific value had decreased, and this summer they had only sufficient to keep going sixteen hours each day out of the twenty-four.

In reply to Mr. Marshall, the destructor had four grates, each capable of burning 10 tons of refuse per day. There had been no necessity for them to use more than three grates.

CLEANSING OF REFUSE RECEPTACLES.

By T. ROBINSON,
Sanitary Inspector and Cleansing Superintendent, Bolton-upon-Dearne.

[In a report which he has recently issued, and from which we make the subjoined extracts, Mr. Robinson deals with the cost of cleansing the different types of receptacles for refuse, and its relation to the question of converting privy middens to the water-carriage system.]

The houses in the district of Bolton-upon-Dearne, numbering 2,028, are fitted with three types of receptacles—viz., dustbins, 806; ashpits, 168; and privies, 1,054. The cost for cleansing during 1915-16 amounted to £523 15s. 9d., or an average cost per house per annum of 5s. 2d. The average cost per privy and ashpit per annum was 5s. 8½d.; that for dustbins being 4s. 4d. per annum.

A comparison for the last three years shows a very satisfactory reduction in the average cost of cleansing the receptacles per annum of from 7s. to 5s. 2d., notwithstanding that during 1915-16 the advance in wages, including war bonuses, amounted to £42 5s.; besides which there were 106 additional new houses with dustbins to be cleared, and this, calculated on the basis of 4s. 4d. per house per annum, would mean an extra cost of £22 19s. 4d.; making the total extra expenditure during the year £65 4s. 4d.

The increased prices of horse food, tools, &c., also affect the total saving adversely, but these items cannot be estimated. The real saving when allowing for increased wages and additional houses was for 1914-15, £150 14s. 11d.; and for 1915-16, £220 12s. 10d.; making a total for the last two years of £371 7s. 9d.

It will be seen that it is much less costly to cleanse dustbins than other types of receptacles. With the present number of houses, if all privies were converted and dustbins substituted it is estimated that the whole of the scavenging could be done in five days instead of six. This would enable the present staff to deal with refuse from an additional 400 houses weekly. Thus, if conversions were to take place coincident with building operations it would obviate the necessity of an increase in the staff, which in the ordinary course will be necessary before long.

At the present time conversions are made entirely at the property owners' expense, and it is a question for the consideration of the council whether the benefit to be derived to the public health would more than compensate for the expense incurred if the council were to adopt a general scheme of conversions under the Public Health Amendment Act, 1907, whereby half the cost of each privy and waste-water closet conversion would be borne by the council.

The cost to the council would probably not exceed £3,000 for privy conversions and £500 for waste water closet conversions. Although this may seem a large expense to incur, yet by the substitution of dustbins for privy middens, on the basis of this year's costs a perpetual saving of £72 9s. 3d. per annum would be effected. This is based on 1,054 privies at 1s. 4½d. each.

A Dearne Valley Water Board Scheme.—The Hoyland Urban District Council have passed a resolution declaring it expedient for the council, in conjunction with the Bolton-on-Dearne (and any other council whose district is wholly or partly within the limits of supply of the Dearne Valley Waterworks Company), to form a water board and purchase the water company's undertaking, and to promote a Bill in Parliament in connection with the scheme.

A RURAL WATER SUPPLY.

CLERK OF CHEPSTOW COUNCIL'S PLAIN SPEAKING.

At the meeting recently of the Chepstow Rural District Council, the clerk, Mr. F. Evans, read letters from the Tintern Parva and Chapel Hill Parish Council declining to accept the Crown water scheme, and also a communication from the clerk to the county council asking for information as to the present position of the Tintern water supply, as the matter was receiving the attention of the county medical officer. The clerk said that the matter had assumed an important position. It seemed to him that that council was wholly responsible, and they had nothing to do with the parish councils. It was only a matter of sentiment that prompted them to consult the parish councils. The time had now come for them to act, and it was their plain duty to do so.

Mr. Williams wished to know if Mr. Hobbs had been written to in regard to the "Crown scheme" since the last meeting.

The clerk replied that he had had no instructions to do so.

Mr. Williams observed that he did not think the people would have the water at the price Mr. Hobbs quoted before.

Mr. Heath: Unless it is a very urgent case, I think it had better stand over at a time like the present.

The clerk: It cannot stand over.

In reply to questions, Mr. Harrison (surveyor and sanitary inspector) stated that the school and several cottages were without a proper water supply.

Mr. Price said that Tintern was well supplied with water, but it was a cruel shame that there should not be a supply of water at the school. That matter had been under discussion for four or five years.

The clerk: You'll look very small indeed if the Local Government Board come down and force it upon you.

After further discussion it was decided on the motion of Mr. Price that a letter should be written to the school managers asking them to provide a water supply at the school, and the question of the water supply for the district was deferred for three months.

The clerk characterised the resolution as one of the most ridiculous ever passed, and, speaking as one who knew the Local Government Board, he warned the council that they were "running into a charging bull." If they neglected to do what the Crown proposed they were accepting a serious responsibility. He only wanted to say that to clear himself.

The chairman: That's quite clear.

BIRMINGHAM PUBLIC WORKS DEPARTMENT.

THE SCHEME OF REORGANISATION COMPLETED.

The Public Works Committee of the Birmingham Town Council state in a recent report that conditions brought about by the war having led to a cessation of executive work in connection with large schemes, advantage has been taken of this to carry out a reorganisation in the administration of the public works department. For this purpose the city has been divided into three administrative divisions, known as the Central, Western, and Eastern Divisions, and each of these has been placed under a chief surveyor. It is hoped, the report proceeds, that as a result of this reorganisation a greater efficiency in the working of the department will be attained, and the city surveyor relieved of the constant attention to detail administration which has hitherto engaged a considerable proportion of his time. In this connection the committee draw attention to the fact that, owing to the scarcity of labour and the impossibility of securing materials, a considerable number of the roads of the city are falling into a bad state of repair, and that some day a large expenditure will be required to bring them up to modern requirements.

During the past summer 247 miles of streets have been tar-sprayed, as compared with 177 miles sprayed in 1915. In selecting the macadamised streets to be tar-sprayed preference was given to the motor-omnibus routes and main roads, and to the poorer class of streets where the houses are built right up to the side of the street. Of the last-mentioned class 405 streets were treated.

Welsh Housing.—The Welsh Housing Association has asked the Government to allocate not less than £5,000,000 to Wales for housing after the war.

INSTITUTION OF MUNICIPAL ENGINEERS.

President. MR. HENRY C. ADAMS, M.INST.C.E., M.I.MECH.E., F.R.SAN.I.
President-Elect. MR. EDWARD WHITWELL, F.I.S.E., M.S.A., Engineer and Surveyor, Abersychan Urban District Council. (Lieut. R.N.V.R.)

ANNUAL MEETING.

The eighth annual general meeting will be held in London to-morrow (Saturday).

PROGRAMME.

11.30 a.m.—Council meeting.
11.45 a.m.—Meet in the council chamber, No. 4 Southampton-row, W.C.
12 noon.—Annual general meeting.
Minutes of last annual general meeting.
Presentation of annual report of council.
Announcement of result of ballot for election of president and council for the year 1916-17.
Installation of president.
Any other business.
12.45 p.m.—Adjourn for lunch.
2.30 p.m.—Reassemble in council chamber.
Presidential address.
Discussion on the following papers to be presented to the meeting:—
"A *Résumé* of Public Health Matters," by G. Belson Chilvers, M.R.SAN.I. (Member).
"Practical Road Work," by Geo. Rodley (Member).
"Notes on the Use of Electricity in Municipal Engineering," by Horace Boot, M.I.E.E., M.I.MECH.E. (past-president).

B. WYAND,
Secretary.

39 Victoria-street, S.W.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

CHIEF WATER INSPECTOR. January 8th. Doncaster Town Council. £150 per annum. Mr. R. E. Ford, acting water engineer, Mansion House, Doncaster.

SURVEYOR AND INSPECTOR OF NUISANCES. January 8th. Chertsey Urban District Council. Mr. Arthur Atkinson, junr., acting clerk, Public Offices, Chertsey, Kent.

SURVEYOR AND INSPECTOR.—January 9th.—Knighton Urban District Council.—Mr. W. A. Collins, clerk, Council Offices, Knighton, Radnorshire.

SANITARY INSPECTORS. January 9th. Bermondsey Borough Council. £150 per annum. Mr. F. Exell, town clerk, Town Hall, Spa-road, Bermondsey, S.E.

ASSISTANT WATERWORKS ENGINEER. January 12th. Guildford Town Council. Minimum wages 70s. per week, with a bonus and rates free. Average hours 48 to 60 per week. Mr. E. Y. Harrison, borough surveyor and water engineer, Town Gate, Guildford.

MAIN ROAD DISTRICT SURVEYOR. January 12th. Derbyshire County Council. £250 per annum.—Mr. J. W. Horton, county surveyor, County Offices, Derby.

TEMPORARY BOROUGH SURVEYOR.—January 12th. Corporation of Montrose. Mr. J. P. Watson, town clerk, Town Hall, Market Lane.

SURVEYOR AND INSPECTOR.—January 15th.—Dorking Urban District Council. £220 per annum.—Mr. W. J. Hodges, clerk, 64 South-street, Dorking.

ASSISTANT ENGINEERS. March 31st. Indian Public Works and State Railways Department. Not less than twenty-six and not more than twenty-four years of age on July 1st. The Secretary, Public Works Department, India Office, London, S.W.

ASSISTANT ELECTRICAL ENGINEER.—Government Electric Light Department, Fort-road, Malta. Salary £200 rising by £20 annually to £300. Messrs. Preece, Cardew, Snell & Rider, 8 Queen Anne's-gate, quoting M.I.E.E.—1/1/17.

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

Buildings.

BEDWELLTY.—For a second-hand temporary building of wood framing, lined with matchboarding and covered with corrugated iron sheets. Dimensions 20 ft. by 16 ft., or thereabouts.—Mr. D. H. Price, surveyor, Aberbargoed, Mon.

Engineering: Iron and Steel.

WIGAN. January 8th.—For the supply of a 30-h.p. motor tower wagon, for the Tramways Committee.—Mr. F. Buckley, general manager, Corporation Tramways, Market-place, Wigan.

ALNWICK.—January 8th.—For providing and fixing four sluice valves, for the rural district council.—Mr. H. W. Walton, clerk, Alnwick.

SYDNEY.—January 8th.—For the supply and erection of pumping machinery in two units, driven by suction gas or by steam, for the Iverell water supply, for the New South Wales Department of Public Works.—Department of Commercial Intelligence, Basinghall-street, E.C.

WEST HAM.—January 11th.—For the supply of one water-tube boiler, and one 3,000-kw. turbo-alternator, for the town council. Mr. J. W. Beauchamp, 84 Romford-road, Stratford.

CARRICK-ON-SHANNON. — January 11th. — For pumping a supply of water, about 60,000 gallons daily, from the Shannon into a reservoir, and lighting the town with electric light, for the rural district council. —The Secretary, Waterworks Committee, Town Hall, Carrick-on-Shannon.

MERTHYR.—January 17th. — For supplying and laying 760 yds. of 12-in. and 9-in. stoneware pipes, for the Merthyr and Aberdare Joint Farms Management Committee. — Mr. W. B. Harris, clerk, Town Hall, Merthyr.

AUCKLAND (New Zealand).—January 21st.—For the supply of mild-steel or iron gates and fencing, for the Harbour Board. Messrs. W. & A. McArthur Canberra House, 18-19 Silk-street, Cripplegate, London, E.C.

Roads.

LEWISHAM.—January 9th.—For the supply of about 9,000 super. yds. of wood paving on concrete, for the borough council. — The Borough Surveyor, Town Hall, Catford, S.E.

NORTH RIDING.—January 10th.—For team labour and hauling (day work and by tonnage), and for macadam and steam rolling, for the county council.—Mr. W. G. Bryning, county surveyor, County Hall, Northallerton.

SPILSBY.—January 12th.—For the supply of 4,000 tons of broken granite, 8,000 tons of broken slag, and 500 tons of slag chippings, for the rural district council.—Mr. W. Cooke Brackenridge, district surveyor of highways, Spilsby.

DURHAM.—January 13th.—For tar-spraying on the main roads, for the county council.—Mr. Albert E. Brookes, county surveyor, Shire Hall, Durham.

BRENTFORD. January 13th. For the supply of 250 yds. of ¾-in. Guernsey granite chippings, for the urban district council.—Mr. J. W. Croxford, surveyor, Clifden House, Boston-road, Brentford.

HERTS.—January 13th.—For the supply of broken granite, slag and tar-macadam, for the county council. —Mr. J. S. Killick, county surveyor, Hatfield.

WOODBRIDGE.—January 15th.—For the supply of granite or basalt broken to pass through a 2½-in. gauge, and to be rejected by a 1½-in. gauge, whole chalk flints, washmill flint, pit flint, Kentish rag, and any other road material, for the rural district council. —Mr. G. Cook, district surveyor, Ipswich-road, Woodbridge.

SOMERSET.—January 20th.—For steam rolling and scarifying, for the county council.—Mr. Gordon R. Folland, acting county surveyor, Wells, Somerset.

SOMERSET. January 20th.—For the supply of broken granite or basalt, for the county council. Mr. Gordon R. Folland, acting county surveyor, Wells, Somerset.

WORCESTERSHIRE.—January 20th. — For the supply of granite, blast-furnace slag, and tar-macadam, for the county council.—Mr. C. F. Gettings, county surveyor, 30 Foregate-street, Worcester.

ESSEX.—January 20th.—For the supply of team labour, stoneware pipes, Norwegian granite kerb and setts, York kerb, and distilled tar, for the county council.—Mr. Percy J. Sheldon, county surveyor, Chelmsford.

ESSEX.—January 20th.—For tar-spraying on main roads, for the county council.—Mr. Percy J. Sheldon, county surveyor, Chelmsford.

MIDHURST.—January 21st.—For the supply of broken granite, for the rural district council.—Mr. A. G. Gibbs, surveyor, Council Offices, Midhurst, Sussex.

SURBITON.—January 22nd.—For the supply and delivery of refined or distilled tar, for the urban district council.—The Surveyor, Council Offices, Ewell-road, Surbiton.

DORSET.—January 24th.—For the supply of granite, basalt, limestone, and tar-macadam, for the county council.—Mr. E. H. Habgood, acting county surveyor, County Offices, Dorchester.

RAMSBOTTOM.—For laying 1,000 sq. yds. of lonkey setts on concrete foundation, for the urban district council.—Mr. T. H. Bell, surveyor.

Sanitary.

HALIFAX.—January 8th.—For the construction of 2,500 lineal yds. of 15-in. and 12-in. iron and earthenware pipe sewers, and manholes, for the corporation. —Mr. J. Lord, borough engineer, Town Hall, Halifax.

ANNFIELD PLAIN.—January 8th.—For the removal of refuse, for the urban district council.—Mr. T. J. Trowsdale, acting sanitary inspector, Council Offices, Hare Law, Annfield Plain.

BULKINGTON.—January 9th.—For the removal of nightsoil, for the urban district council.—Mr. H. W. Wilson, surveyor, Attleborough, Nuneaton.

BURNLEY.—January 12th.—For the supply of men and harnessed horses for machine sweeping and watering of streets, and for the supply of men, carts and harnessed horses for the removal of refuse, for the corporation.—Cleansing Superintendent, Aqueduct-street.

COULSDON.—January 13th.—For the supply on hire of horses and men for the removal of refuse, for the urban district council.—Mr. E. J. Gowen, clerk, Council Offices, Purley.

WILLESDEN.—January 15th.—For the removal of refuse, for the urban district council.—Mr. S. W. Ball, clerk, Municipal Offices, Dyne-road, Kilburn, N.W.

CHELMSFORD.—January 16th.—For the construction of a surface-water drain and other drainage works, for the corporation. — Mr. P. T. Harrison, borough engineer, Municipal Offices, Chelmsford.

HAMBLEDON.—January 16th.—For scavenging the district, for the rural district council.—Mr. F. Smallpiece, clerk, 138 High-street, Guildford.

NORTHWICH.—January 22nd.—For the collection and removal of refuse, for the urban district council. —Mr. J. A. Cowley, clerk, Council House, Northwich.

Stores.

DESBOROUGH.—January 8th.—For the supply of tar-macadam, broken granite, slag, gravel, sanitary pipes, blue bricks and paviors, and Portland cement, for the urban district council.—Mr. W. Marlow, surveyor, Council Offices, Desborough.

HORNSEY.—January 8th.—For the supply of road materials, paving, granite and general mason's materials, mason's and pavior's work, Portland cement, forage, iron and steel, disinfectants, and cartage, for the corporation.—Mr. E. J. Lovegrove, borough engineer and surveyor, Town Hall, Southwood-lane, Highgate, N.

ST. PANCRAS.—January 8th.—For the removal of sweepings and gully soil, horsing water vans, horsing road sweeping and other machines, cartage, timber and joinery, barrows, trucks, handles, paints, oils, tools, Yorkshire stone and artificial paving slabs, granite kerbs, paving setts, broken granite, Kentish rag, gravel, lime, cement, stoneware pipes, bass brooms, horse-brush stocks, pitch, tar, and creosote oil, for the borough council. — Mr. W. N. Blair, borough engineer and surveyor.

HAMPSTEAD.—January 10th.—For slopping, team work, Yorkshire and other natural footway paving, artificial footway paving, broken granite, basalt, gravel, hoggin, shingle, ballast, sand, pitch, tar, creosote oil, tar paving, tar-macadam, ironmongery, tools, iron castings, brooms, sorting-house refuse, disinfectants, and electrical engineer's stores, for the borough council. — Mr. A. P. Johnson, town clerk, Town Hall, Hampstead, N.W.

PLYMOUTH.—January 15th.—For the supply of paints, varnishes, ironwork, petroleum oil, broomheads, household brushes, rope, iron and steel, pitch-pine, deals, flooring, carbolic powder, Portland cement, lubricating oils, tar and pitch, painter's brushes, explosives, soap, wood blocks, creosote, disinfectant fluid, granite kerbs, setts, white lead, red lead, linseed oil, turpentine and turpentine substitute, refilling machine revolving brooms, benzoline and motor spirit, tools, indiarubber goods, hose, and ship chandler's goods, for the corporation. — Mr. James Paton, borough engineer and surveyor, Municipal Offices, Plymouth.

Miscellaneous.

SALFORD.—For the supply of brushes, for the Lighting and Cleansing Committee. — The Superintendent, Wilburn-street Depot, Salford.

FORTHCOMING MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

JANUARY.

3.—Institution of Sanitary Engineers: Presidential Address. Caxton Hall, Westminster, 7.30 p.m.

5.—Town Planning Institute: Prof. P. Abercrombie and Mr. S. A. Kelly on "A New Town Plan for the City of Dublin." 6 p.m.

6.—Institution of Municipal Engineers: Annual Meeting, 4 Southampton-row, London, W.C.

11.—Institution of Electrical Engineers: Messrs. F. Gill and W. W. Cook on "The Principles Involved in Computing the Depreciation of Plant." 8 p.m.

25.—Concrete Institute: Mr. C. R. Peers on "The Care of Ancient Monuments."

APPOINTMENTS OPEN.

CHERITON URBAN DISTRICT COUNCIL.

APPOINTMENT (TEMPORARY) OF SURVEYOR AND INSPECTOR OF NUISANCES.

The Urban District Council of Cheriton invite applications from gentlemen willing to act during the war as Surveyor and Inspector of Nuisances, subject (as to the latter office) to the approval of the Local Government Board.

Applicants (who will understand that they are asked to take the place of the Official who is away on military service) must be ineligible for military service. They must have efficient knowledge of Sanitary matters and Sewerage Works, and be fully competent to carry out the duties usually appertaining to the respective offices, including those of a Hackney Carriage Inspector, and those specified in any By-laws in force within the Urban District, and also the duties under the Dairies, Cowsheds and Milkshops Order, the Factories and Workshops Act, the Housing and Town Planning Act, and the duties of Petroleum Inspector, &c.

The area of the District is about 1,179 acres, with about 5 miles of roads, and a population of 7,577. The Main Roads are not under the Council's jurisdiction.

Applicants must be prepared to spend their whole time, if appointed, in the duties of their office. Private practice might be allowed with special leave of the Council. The successful candidate will be required to give the usual bond, the premium on which will be paid by the Council, and to enter into a written agreement with the Council.

Applications (endorsed "Surveyor"), stating age, experience, and salary required, with copies of not less than three recent testimonials (which will not be returned) as to character and competency, must be made in candidate's own handwriting, and sent so as to reach the undersigned not later than the 8th day of January, 1917.

Canvassing Members of the Council will disqualify.

NOTE.—The salary at present authorised by the Local Government Board for Inspector of Nuisances is £105.

(By order of the Council)

ARTHUR ATKINSON, JUNR.,
Acting Clerk.

Public Offices,
Cheriton, Kent. (3,201)

DERBYSHIRE COUNTY COUNCIL.
MAIN ROAD DISTRICT SURVEYOR.

Wanted, immediately, for the period of the war, Temporary District Surveyor, ineligible for military service, to take charge of Main Roads in a district under direct maintenance.

Salary at the rate of £220 per annum, to include provision and maintenance of motor bicycle. An additional allowance of £10 per annum will be made for provision of office.

Particulars of duties, &c., and Form of Application can be obtained from the undersigned, to whom applications must be sent on the special Form not later than Saturday, January 13.

J. W. HORTON,
County Surveyor.

County Offices, Derby.
January 2, 1917. (3,223)

APPOINTMENT WANTED.

ENGINEER AND SURVEYOR'S Chief Assistant, under 40 years of age, ineligible for military service, is open to substitute for similar engagement with important Local Authority. Advertiser is fully qualified, and has considerable experience in all works in connection with the Surveyor's Department of large Local Authorities.—Box 1,599, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (3,220)

TENDERS WANTED.

DORSET COUNTY COUNCIL.
TENDERS FOR MAIN ROAD MATERIALS.

The County Works Committee are prepared to receive Tenders for the Supply of Granite, Basalt, Limestone and Tar-macadam, delivered to Railway Stations and Wharves in the County during the year ending 31st March, 1918.

Particulars and Forms of Tender may be obtained from the undersigned.

Sealed Tenders, marked "Stone Tender," must be delivered to me not later than Wednesday, 24th January, 1917. Samples must accompany Tender.

E. H. HABGOOD,
Acting County Surveyor.

County Offices,
Dorchester.
January 2, 1917. (3,221)

SURBITON URBAN DISTRICT COUNCIL.
TENDERS FOR THE SUPPLY OF REFINED OR DISTILLED TAR.

Tenders are invited for the Supply and Delivery of Refined or Distilled Tar, required for use on the Roads in the District under the control of the above Council, for the period from 1st April to 30th September, 1917.

Specifications and Forms of Tender can be obtained on application to the Surveyor to the Council.

Tenders must be delivered to me at or before noon on Monday, January 22nd, 1917.

The Council do not bind themselves to accept the lowest or any Tender.

FREDERICK W. WOOD,
Clerk to the Council.

Council Offices,
Ewell-road, Surbiton.
December 29, 1916. (3,222)

ESSEX COUNTY COUNCIL.
HIGHWAYS COMMITTEE.

The Essex County Council are prepared to receive Tenders for the year ending 31st March, 1918, for the Supply of Materials, Team Labour, &c., as set out in the Schedule below:—

1. Team Labour.
2. Stoneware Pipes.
3. Norwegian Granite Kerb and Setts, York Kerb, &c.
4. Distilled Tar.

Forms of Tender, with the special envelope in which Tenders are to be delivered, and all other information and particulars, can be obtained at the County Surveyor's Office at Chelmsford.

Tenders to be delivered on or before Saturday, the 20th January, 1917.

PERCY J. SHELDON, M.INST.C.E.,
County Surveyor.

Chelmsford.
December 28, 1916. (3,218)

ESSEX COUNTY COUNCIL.
TENDERS FOR TAR-SPRAYING.

The Highways Committee invite Tenders for Tar-spraying on the Main Roads in the County of Essex during the year 1917. The area to be sprayed will be approximately 750,000 super. yds.

Specification and Form of Tender may be obtained on application to the undersigned, to whom sealed Tenders, endorsed "Tender for Tar-spraying," are to be delivered on or before Saturday, 20th January, 1917.

The Council do not bind themselves to accept the lowest or any Tender.

PERCY J. SHELDON,
County Surveyor.

December 28, 1916. (3,219)

BOROUGH OF PLYMOUTH.

Notice is hereby given that after the expiration of 10 days from the date hereof the Corporation intend to enter into Contracts for the Supply of the following Goods and Materials for one year:—

Schedule No. 3.—Section A.—Paints.
Section B.—Varnishes.
" " 5.—Ironwork.
" " 7.—Petroleum Oil.
" " 8.—Broomheads.
" " 9.—Household Brushes.
" " 10.—Rope.
" " 11.—Iron and Steel.
" " 13.—Pitchpine, Deals, Flooring, &c.
" " 14.—Carbolic Powder.
" " 15.—Portland Cement.
" " 16.—Section A. — Lubricating Oils (Samples to be submitted by Tenderers).
Section B.—Fuel Oil.
" " 17.—Tar and Pitch, includes refined tar for use in the construction of tarred macadam roads and for tar-spraying.
" " 18.—Painter's Brushes.
" " 19.—Explosives.
" " 22.—Soap (Yellow, Carbolic, Toilet, Soft).
" " 23.—Wood Blocks, Soft.
" " 24.—Creosote.
" " 28.—Disinfectant Fluid.
" " 29.—Granite Kerbs, Setts, &c.
" " 30.—White Lead, Red Lead, Linseed Oil, Turpentine and Turpentine Substitute.
" " 31.—Refilling Machine Revolving Brooms.
" " 33.—Benzoline and Motor Spirit.
" " 34.—Tools.
" " 35.—Indiarubber Goods, Hose, &c.
" " 36.—Ship Chandler's Goods (Sundry Oils, Waste, Grease, Metal Polish, Matches, &c.).

With the exception of Schedules 4, 17, 19, 21, 23 to 29 inclusive, 31, 32, 37, 38, the Schedules include for the Supply and Delivery of Materials to Wrangaton Station, Great Western Railway, about 13 miles from Plymouth, for the Plymouth Borough Asylum.

Tenders must be based on the whole of a Schedule (with the exception of Schedules Nos. 3, 4, 15, 21, 22, 26, 29, and 36), and not on any particular item contained therein.

(Separate Tenders will be considered for Sections A and B of Schedule No. 3, also Sections A and B, Schedule 16, and Sections A, B, C, Schedule 26.)

Schedules may be obtained on payment of a deposit of £1 in cash for each Schedule. The deposits on the Schedules will be returned, provided *bonâ-fide* Tenders are received on or before the 15th January, 1917. Should the Contractor withdraw his Tender, or fail to send in one, the amount of his deposit will be forfeited, and the Contractor who applies for the Schedules must do so on the distinct understanding that he is willing to abide by the terms of this advertisement.

The lowest or any Tender will not necessarily be accepted.

Tenders to be delivered not later than Monday, January 15th, 1917, addressed to the undersigned.

JAMES PATON,
Borough Engineer and Surveyor.

Municipal Offices,
Plymouth.
December 15, 1916. (3,207)

The Surveyor

And Municipal and County Engineer.

Vol. LI. JANUARY 12, 1917. No. 1,304.

Minutes of Proceedings.

A New Year's Creed.

By way of a New Year's greeting we print the following lines, which are anonymous, but probably American:—

"I know, as my life grows older
And mine eyes have clearer sight,
That under each rank wrong somewhere
There lies the root of right;
That each sorrow has its purpose,
By the sorrowing oft unguessed;
That, as sure as the sun brings morning,
Whatever is, is best."

* * *

Rural Housing.

As indicated in our last issue, the recently issued report of the special committee appointed by the Surveyors' Institution to consider after-war problems was divided into two parts, dealing respectively with urban and rural aspects of the question. We then dealt at some length with the recommendations of the committee so far as urban areas are concerned, and this week we propose to discuss shortly the rural report on the reconstruction of agriculture and forestry. This part of the report is directed mainly to making suggestions for securing prosperity to agriculture after the war, and, although much that is said does not affect municipal engineers professionally, the whole is of great general interest. The serious nature of existing agricultural conditions is shown by a tabular statement, the figures in which indicate that, without any appreciable increase in the amount of live stock kept, this country produced less wheat by upwards of 7,000,000 quarters in 1914 than in 1874, and nearly 3,000,000 quarters less barley. The war has amply demonstrated that this serious reduction in the home production of grain may become a real menace to our national security. Among the suggestions put forward for meeting the situation is one in regard to rating. The committee consider that the complaints which are made against the existing system of rating are due mainly to the increasing burden of the rates, and to the fact that a large proportion of the cost of national services, such as education and the maintenance of main roads, to which the increase is chiefly due, falls disproportionately upon farmers, who obtain no commensurate advantage. They therefore suggest that relief should be granted from the Exchequer in regard to these services—a recommendation which is in entire accord with the views we ourselves have frequently expressed.

In discussing the amelioration of rural conditions, it was, of course, inevitable that the committee should deal with the rural housing problem, and it is the part of the report which treats of this subject which will probably be of the most direct interest to our readers. It is evident that agriculture cannot be revived unless some means can be devised of attracting labour to the land. To do this involves (1) a reasonable standard of wages, (2) the provision of suitable arrangements for housing the labourer and his family, and (3) reasonable prospects of advancement. The first two of these factors are so interdependent that they must be considered together. In stating that in rural districts there is "on the whole" a shortage of cottages at the present time, the committee use words which are scarcely adequate to describe the great scarcity which exists in every part of the country. It is apparent therefore that any attempt to secure a large increase in the rural population must be preceded by cottage building on a large scale. A general rise in agricultural wages, so as to enable the labourer to pay an economic rent for his cottage might attract the capital of the speculator for building purposes. On the whole, however, we feel with the committee that it would be unwise to place too sanguine a reliance upon the assistance likely to be obtained from outside investors in solving the problem of housing in rural districts. The question then arises as to whether the landowner will do what is necessary. There can be little doubt that he will do much if he can secure a rather better return on his capital than is possible in present circumstances. In so far, however, as he fails to meet the need, it must, as the committee point out, be met by the local authorities, who should have compulsory powers with regard to the purchase of sites. In this connection the recommendation of the committee is that where, after inquiry by the Board of Agriculture, a shortage of houses for the natural requirements of a parish or district is found to exist, the provisions of the Housing (No. 2) Act, 1914, should be put into force, and if the landowners do not themselves erect the necessary houses, the sites should be obtainable at the market price of the land, if necessary under compulsory powers.

The Organisation of Forestry.

No scheme of rural reorganisation after the war would be complete if it did not include an attempt to place afforestation on a more satisfactory footing. It has been estimated that there are about 9,000,000 acres of land in the United Kingdom suitable for planting with trees, and if only a fraction of this vast area were dealt with a good deal of healthy outdoor work would be provided. The dependence of the country on

foreign sources of timber supply is shown by the fact that in the last complete year before the war over 11,000,000 loads of timber were imported. This was largely stopped by the advent of war conditions, which imposed other necessary work upon our shipping, and it at once became necessary to organise home supplies as far as possible to meet the resulting shortage. The result has been an immediate consumption of home-grown timber out of all proportion to the amount which might properly be looked upon as annually available. The supplies for the future have thus been very seriously depleted and the need for a national scheme of afforestation accordingly emphasised. If, as is feared, the war should be followed by a period of acute unemployment, the inception of afforestation schemes would be a most useful method of relieving the situation, inasmuch as, apart from the value of the land, from two-thirds to five-sixths of the initial cost of new plantations would be expended on labour. As far as local authorities are immediately concerned, however, proposals for afforestation would be confined principally to the planting of catchment areas in connection with water schemes. The committee express the opinion that every encouragement should be offered to municipal and other authorities to prepare and carry out carefully considered schemes for the planting of these areas, as being advantageous (*a*) to ratepayers, in view of the value of woodlands for conserving a water supply and preventing the silting up of reservoirs, and in the gradually accumulating capital represented by the growing trees; and (*b*) to the nation, by providing a further source of employment to the population, and creating a reserve of timber against a time of need.

* * *

Subsiding Highways.

Apropos of the discussion at a recent meeting of the Stokesley Rural District Council (referred to in our issue of December 22nd last, at p. 570 with reference to the subsidence of the field footpath between Stokesley and Great Ayton, we think it may be of interest to our readers to consider briefly the duties and rights of highway authorities with respect to subsiding highways. It may be stated as a general principle that, in ordinary circumstances, it is the duty of a highway authority to keep all their highways (both roads and footpaths) in such repair and condition as to be reasonably passable for ordinary traffic at all seasons of the year, and to do whatever may be necessary to that end. Where, however, a highway has been rendered impassable, whether by natural causes or otherwise, the question may arise whether repairs are reasonably practicable, with reference either to the nature and situation of the highway or to the character of the accident or operation which has rendered it impassable, or whether it has been wholly destroyed (in which case the liability to repair it is at an end). Where, for instance, a road crossed the bed of a river, which flooded it at every tide, washing away the materials of which it was composed and leaving a deposit of mud, the authority were relieved of the liability to do repairs which, in the nature of things, must always be ineffectual (*Rex* v. *Landulph*, 1 Mau. & S., 393). But where, on the other hand, a road had been carried away by a landslip, and the work of restoration involved no exceptional difficulty or unreasonable expense, it was held that it must be carried out (*R* v. *Croydon*, 1876, 1 Q.B., 703).

Applying these principles to the case of a subsiding highway it seems clear that, *primâ facie*, and in the absence of special circumstances, it is the duty of the authority to do whatever may be necessary to make it as convenient as it was before the subsidence. This need not necessarily involve the raising of the way to its original level, and indeed there may be circumstances in which this would be inadvisable, as, for instance, where the subsidence is the result of mining operations, and the cost of raising it would be considerable. In *Wednesbury Corporation* v. *Lodge Holes Colliery Company, Limited* (72 J.P., 417), a road had subsided in consequence of the working of the company's coal mines, and the corporation restored it to its former level, and claimed to be repaid the expense by the company. But it was held by the House of Lords that the company were not bound to pay more than the cost of making the road as commodious to the public, within reasonable limits, as it was before. But, although the authority are not necessarily bound to restore the original level of every or any subsiding highway, it is clear that they have the right to do so, even although this may obstruct the access to the premises of a frontager (*Atherton* v. *Cheshire County Council*, 60 J.P., 6).

* * *

Burst Water Mains.

There can be no doubt that the general rule of law that, apart from the provisions of special statutes in certain cases, damages cannot be recovered from water undertakers in respect of injuries caused either to roads or to private property by the bursting of mains unless negligence can be proved operates very unjustly. In the memorandum on the subject submitted at the December meeting of the Association of Municipal Corporations two specific instances were cited. The first occurred in Chiswick a few years ago, when a main belonging to the Metropolitan Water Board burst, causing damage to the highway which cost some £120 to repair. The board denied liability, but ultimately repaid the amount as an act of grace. In the second case, which occurred at Ealing, the board were not so graciously inclined, and, resting on their strict legal rights, they declined to repay a sum of upwards of £300 spent by the local authority in similar circumstances. The hardship really arises from the fact that it is usually quite impossible to prove negligence in the laying or maintenance of old mains. In one case, however, within our knowledge, the plaintiff, in an action against a water authority, whose property had been damaged by the bursting of a main, succeeded in the early stages of the proceedings in getting an order for inspection of the main at the point of fracture, which had been removed to the offices of the authority. This inspection was made by an expert on behalf of the plaintiff, and revealed a flaw in the main in the nature of a hole which had been filled in with foreign metal. The result was that the action was compromised by the water authority, who paid damages rather than take the matter into court. We merely mention this in order to show that it is certainly worth while to endeavour to find some evidence of negligence, although such a task may not appear to be a very hopeful one. It would work more equitably on the whole, perhaps, if the law were to presume negligence from the fact of the burst, and put upon the water undertakers the burden of rebutting such a presumption.

* * *

Dublin Workshops: How Not to do it.

The complaints made recently with respect to the Dublin Corporation municipal workshops have had a sequel which will not come as a surprise to those who appreciated the position as it was then disclosed. Mr. Rice, law agent to the corporation, has made inquiry into the status of the workshops, and his report constitutes a whole hearted condemnation of these concerns, alike in their inception and management. It appears that the workshops, although a corporation department and a corporation undertaking,

"financed and maintained out of the rates," are to a large extent treated by the corporation itself as an institution having no relation to civic authority, and dealt with in all business transactions in the same manner as if they were a firm of contractors altogether outside and independent of the corporation. While the Workshops Committee's estimates are placed in close competition with the estimates of outside firms, the corporation at the same time compels the committee to give to the men terms of employment, leave, holidays, and sick leave which are not imposed upon outside employers, and which exemption enables outside employers to compete with the Workshops Committee on the most favourable terms. The result was such as might have been anticipated by the merest tyro in business affairs. The committee, in carrying out the city council's orders, were forced to quote higher prices than the outside firms, with the result that comparatively little work was executed by the department. And all this time the committee have kept men "standing idle and receiving pay out of the rates"!

Surely futility could hardly go further than this. With a candour which is more than justified, Mr. Rice asserts that "it is an insane proceeding for the committee or for the council to retain on the basis of permanent employees any men for whom it cannot guarantee continuous work, and on the other hand it seems to me to be a very foolish proceeding to endeavour to establish corporation workshops upon any basis but that of carrying out through the corporation workshops all the corporation works which are not already in the hands of established departments, so far as the same can be carried out by the Workshops Committee." He proposes to cut down the staff to the absolute minimum, but we should say that a better remedy for such an extraordinary example of municipal ineptitude would be to abolish the department altogether.

* * *

The Metric System.

The extreme trade competition—to avoid a harsher phrase—in which this country will be engaged after the war renders it imperative that every possible step should be taken which will enable us more efficiently to discharge the task which we shall have to undertake. In this connection there is a strong current of opinion that the adoption of the metric system of money, weights, and measures would be of material assistance to the mercantile community. As is pointed out in a circular recently issued by the Decimal Association, our customers in foreign countries do not easily understand quotations and specifications based upon the British system, and as time can ill be spared for the calculation of equivalents, there is a strong temptation for them to go to other markets where the system to which they are accustomed is in use. In any event, the retention of the present system must inevitably involve many calculations, with the consequent risk of error and waste of time. At present the British manufacturer who sells goods in metric-using countries must work on one system of weights and measures for his home trade and another for his foreign business. In merchants' offices the principals, clerks, and others associated with the work are compelled to use both systems of measurements. As few men can think clearly in two systems and truly estimate values or dimensions, it is difficult to compete with countries which are not burdened with weights and measures unintelligible to their neighbours. Thus the war provides strong additional reasons for urging a reform which many believe to be long overdue, and it is to be hoped that the Government may be induced to take the matter into serious consideration at a very early date.

* * *

Animals on the Highway.

In our issue of August 4th last we made a few observations on the subject of animals straying on the highway, and we referred to several cases in which the question of the liability of the owner of such animals for accidents due to their presence had been decided. It may be remembered that in one case fowls, in another cows, and in the third sheep, were the cause of an accident, and that in each instance the owner of the animals was absolved from liability to the injured party; albeit that in the case of the sheep the owner had been fined under sec. 25 of the Highway Act, 1864. In each of these cases the animals had *strayed* on to the road, and were unattended. But in the recent case of *Turner* v. *Coates* (*Times*, November 24th last) an accident was caused by an unbroken colt belonging to the defendant which was being led by a boy from one farm to another, the defendant himself following it. The plaintiff (a nurse) was cycling along the road, and the colt, taking fright at the bicycle lamp, dashed across the road and knocked her over. In this case the court held that the defendant was liable, drawing a somewhat fine distinction between "harmless" animals, such as sheep and fowls, and an unbroken colt, which is likely to be dangerous on the highway. We should think that to most users of the highway there is not much (if any) less risk in the presence of "harmless" animals wandering about at their own sweet will, than there is in that of a "dangerous" animal under some sort of control; and this decision, satisfactory as it may be in some aspects, does not appear to us to go very far towards removing what we cannot but regard as the anomalous state of the law on this subject. For our own part we confess that we cannot see on what principle the owner should be considered less culpable in the case of straying animals than in the case of a led animal brought on to the highway for the legitimate purpose of passage. If fine distinctions are to be drawn, we should have thought that the former was the more culpable of the two.

* * *

The Institution of Municipal Engineers.

The Institution of Municipal Engineers enjoys the honour of having as its president this year one who is on service, and who was consequently unable to be present at the annual meeting to deliver his inaugural address. It would be idle to suggest that Mr. Whitwell's absence was not keenly felt, but as far as possible it was atoned for by the very able presidential address which he had prepared. This was a model of what such an address should be, in that it comprised a survey of the whole field of municipal engineering work without entering into too much detail in regard to any section. Considerations of space prevent us from reviewing the address at any length, but there are one or two points to which attention may perhaps be specially directed. His remarks with regard to security of tenure were very sound. Our own view has always been that this question is inextricably bound up with those of qualification and pay, and to this Mr. Whitwell assents. It is only by strenuous united effort, however, that anything is ever likely to be achieved. In regard to housing, the situation was well summed up. Once turn to the real aspect, said Mr. Whitwell, once understand that correct and sensible housing accommodation—which must include all the essentials for health and all the securities from disease—is as vital to the well-being of the nation as it is to the individual, then, and then only, will it be realised that, instead of building to fit the means, it is necessary to fit the means to the building.

New York City Water Supply.

THE CATSKILL MOUNTAINS SCHEME.

By W. J. E. BINNIE, B.A., M.INST.C.E., F.G.S.*

[Concluded from last week.]

The pressure tunnels which have already been referred to were employed for a total length of 35 miles at seven different points, and it is an expensive type of construction, costing nearly £30 per foot run. Owing to the fact that these tunnels are subjected to internal pressure, the waterway is circular, 14 ft. 6 in. in diameter, giving a cross-sectional area of 165 sq. ft., the hydraulic gradient being arranged so as to give the higher velocity necessary to discharge the same quantity of water as the cut-and-cover type. The longest pressure tunnel is that under New York itself, where the length is about 15 miles.

The enormous pipes necessary to carry such large volumes of water were out of the question under the streets of New York, already taken up with pipes, cables, tramways, subways, and sewers, and this pressure tunnel deep in the rock was really the only feasible method of solving the problem at anything like a reasonable cost. The water is conveyed to the surface through pipes connecting with the tunnel below at various points, there being twenty-six connections 4 ft. in diameter and six connections 72 in. in diameter, the pressure in the mains at street level being from 80 lb. to 100 lb. per square inch.

The Croton aqueduct is a pressure tunnel 33 miles long, but the maximum internal pressure to which it was subjected was only about 180 lb. per square inch. The low maintenance charges of this aqueduct was an important factor, and determined the use of pressure tunnel instead of pipes when the conditions were suitable.

In addition to the tunnels under water pressure, there were twenty-four tunnels through mountains constructed on the hydraulic gradient, and called grade tunnels, the longest being a little over 2 miles and their total length being 14 miles. They were constructed of horseshoe section, having a waterway of 199 sq. ft., and cost about £22 per foot run, being therefore nearly twice as expensive as the cut-and-cover and about three-quarters as costly as the pressure tunnels.

Pipe syphons are used to the extent of about 6¾ miles, and cost about £17 per foot run. Generally speaking, only one line of pipe, of riveted steel 9 ft. 6 in. in diameter to deliver 250,000,000 gallons per diem, was laid in the first instance, provision being made for two others to be added when required. It would thus appear that, for a syphon to carry the same amount of water, there would be very little difference between the cost of the pressure tunnel and the steel pipes.

The maximum head to be carried was 360 ft. of water, and the steel varied from ⅞ in. to ¾ in. in thickness, the maximum stress being rather over 5 tons per square inch of the steel. A pipe so thin in relation to its diameter requires, of course, additional support, which was provided by means of concrete backing varying from 6 in. to 18 in. in thickness, and this concrete also protects the outside of the pipe from corrosion.

The question of corrosion gave the engineers much concern, and investigations were carried out which showed the great value of Portland cement as a protective covering, and the pipes were accordingly lined inside with 2 in. of Portland cement mortar. Owing to distortion of the pipe under varying loads, it is, of course, impossible to obtain perfect contact between the steel and the mortar lining, but experiments showed that even with the mortar separated from the *Londonderry*, to the extent of 1·25 in., percolating water lost the other hand its corrosive power. The remainder a hundredth, and the short portion which terminates enormous difficulty voir—consists of cast-iron pipes was laid that it by the syphon under the *Croton*, 1876. 1 Q B. sible point was designed. stion was entered into

Applying these principles as finally determined ding highways a section checks has been satisfactory, and in the absence of special cir the duty of the authority to do ing Silver Lake necessary to make it as economical two more before the pipe does. This need n

service reservoirs were constructed, the first called the Kensico reservoir, situated about 75 miles from the commencement of the aqueduct, and the second, the Hill View reservoir, at Mile 92, just before the city is entered.

The Kensico reservoir is on the Bronx River, which is already utilised for the supply of New York, and consists in an enlargement of the existing reservoir so as to hold 29,000,000,000 gallons, or fifty-eight days' supply of the flow of the aqueduct, an unusually large provision. Although only a service reservoir, it holds more than twice as much as the Vyrnwy reservoir for the supply of Liverpool. The water is to be impounded by a masonry dam 170 ft. in height above the river bed, the foundations being carried to a maximum depth of 130 ft. below the river bed, and its total length is 1,830 ft. Its maximum thickness, where founded on the solid rock, is 228 ft., so that it is a much larger structure than the Olive Bridge dam, and it is generally of similar construction to that dam, except that the downstream face is to be finished with granite.

The reservoir will be of irregular shape, dotted with islands, and much thought has been given to its æsthetic treatment. As it was built inside and upstream of the existing Kensico embankment, the headwork of the Bronx aqueduct, the existing reservoir had to be drained and two large temporary lakes formed, having a total capacity of 5,000,000,000 gallons, in order to keep up the Bronx supply. These lakes were formed by means of earth embankments with timber core walls from 40 ft. to 50 ft. high, and each about 470 ft. in length. There is a good deal of swampy ground which will be within the reservoir area, and these areas are to be covered with clean soil and sand. It is expected that this work, which was let in September, 1910, will take ten years to complete, and therefore the Catskill aqueduct is so arranged that the water can either be discharged into the reservoir or can flow straight to the city by means of a by-pass.

HILL VIEW SERVICE RESERVOIR.

The Hill View service reservoir will hold 900,000,000 gallons, and is for the purpose of equalising the fluctuations in demand for water. The Catskill water can either enter this reservoir or can be carried through it by means of a conduit 12 ft. in diameter constructed in a wall, which divides the reservoir into two partitions.

The reservoir is entirely artificial—that is, it is dug out—and the excavated material deposited in the surrounding embankments, the depth of excavation, which is in glacial boulder till reaching a maximum of 45 ft., and the total excavation amounting to about 2,900,000 cub. yds. The banks have no core walls, and consist of an inner embankment of carefully selected material rolled in 4-in. layers brought up to above water-level, and an outer embankment resting against and covering this special embankment.

The absence of core walls is unusual, but no doubt the nature of the material, the way in which it was spread and rolled, and the care taken in stripping and in making a good connection between the bank and the original ground was considered to be a guarantee of its watertightness, seeing that the depth of water was only 45 ft.

The complete cost of this gigantic scheme cannot yet be determined, but there is no doubt that it will be carried out at a very reasonable figure, considering its magnitude. Although the aqueduct carries 500,000,000 gallons a day, whereas the Croton aqueduct carried only 300,000,000 gallons a day, it has only cost about 10 per cent more per foot run than the Croton aqueduct.

The number of men employed on the contractors' forces reached a maximum of between 15,000 and 16,000 in the year 1910. This does not seem a large figure, considering the size of the work, and it is to be accounted for by the fact that machinery was used wherever possible to supersede hand labour. The wages varied from about 8s. 6d. paid to general labourers to 16s. per day for skilled labour, and the actual contract prices at which the work was let do

not differ materially from those obtaining in this country just before the war.

A very large engineering staff was employed, working under the direction of Mr. Waldo Smith, the chief engineer, reaching a total of over 1,300 men in the year 1910. Mr. Waldo Smith had also a board of consulting engineers to assist him with their advice.

BURSTING OF WATER MAINS.

THE POSITION OF HIGHWAY AUTHORITIES.

At the last meeting of the Association of Municipal Corporations, held at Caxton Hall, Westminster, a memorandum by the town clerk of Ealing, on the subject of the bursting of water mains and the legal position of highway authorities in the matter of the reinstatement of damaged roadways, was presented in a report by the Law Committee. The injustice of the existing law within the area of the Metropolitan Water Board, having regard to the fact that that authority's obligations outside the county of London differed from those within the county, was commented upon by the committee, and the opinion was expressed that the same principle should operate throughout the whole of the board's area. The memorandum is as follows:—

(1) The position of water undertakers and local authorities outside the London Metropolitan area who act as surveyors of highways has recently been brought into prominence in the western part of Greater London by incidents which have occurred in the urban district of Chiswick and the borough of Ealing respectively.

(2) In Chiswick a few years ago a water main of the Metropolitan Water Board burst, causing damage to the highway that cost £119 12s. to repair. After a great deal of pressure had been brought to bear the board eventually repaid this amount to the urban district council, but as an act of grace only, the engineer to the board informing the engineer to the council that "no further payments would be made in respect of similar damage in the future."

(3) In the early part of this year a 30-in. main of the Metropolitan Water Board burst where it passes under the main road in Ealing, leading from London to the West of England, known as the Uxbridge Road, tearing up the highway and the tramway track and dislocating the traffic.

(4) The cost of repairing this amounted to £304 4s. 8d., including £29 3s. 8d., the cost of opening and reinstating a part that was opened for the board at their request to enable them to get at a part of the main requiring repair that had not been exposed by the action of the water bursting forth from the main. This latter amount only the board has agreed to pay, though an endeavour was made to get them to pay the whole of the amount, as they did in the case of Chiswick, they decline to do so. They state that they do not see their way "to depart from their statutory position that, where damage to the roadway results from burst mains, and the board are not guilty of negligence, the board will reinstate so much only of such road as they are by law liable to repair."

(5) It is, however, considered that in such a case the local authority should not be at the mercy of the water undertakers, who in the area of the Metropolis are liable to a penalty if they do not repair damage to a highway caused by the bursting of a main.

(6) This liability arises under sec. 112 of the Metropolis Management Act of 1855, which is as follows:—

"In case any part of the pavement of any street be sunk, broken, injured, or damaged by reason of the breaking, bursting, or want of repair of any pipe belonging to any water, gas, or other company, it shall be lawful for the vestry or district board of the parish or district in which such pavement is situated, if they deem it expedient so to do, to cause notice to be given to the company, to whom such pipe is supposed to belong, forthwith well and sufficiently to repair and make good such pavement, and if the company to whom such notice is given do not within forty-eight hours next after such notice take up such pavement and well and sufficiently repair and amend such pipe, and cause the ground to be well and sufficiently filled in and rammed down, and the said pavement to be relaid and repaired to the satisfaction of the vestry or district board, then such company so offending shall for every such offence forfeit and pay any sum not exceeding twenty pounds."

(7) It is obvious, however, that a penalty of £20 is inadequate to meet such a case as either of those before alluded to, and a clause such as appears in many private Acts with reference to damage done by bursting of waterworks, but applicable only to damage done to highways by bursting of pipes or mains, is what is desired.

(8) An opinion is quoted that without special enactment a claim for damage to a highway by a local authority against a water undertaker caused by the bursting of a main would not succeed unless negligence could be proved. (*Green* v. *Chelsea Waterworks Company*, 70 L.T.N.S., 547; *Snook* v. *Grand Junction Waterworks Company* [1886], 2 T.L.R., 308; and *Dixon* v. *Metropolitan Water Board of Works* [1881], 7 Q.B.D., 1,418.)

(9) Even if there had been any negligence when the main was laid, or in the maintenance thereof, in 99 cases out of 100 proof would be impossible.

(10) Precedents for the recovery of damage done by the bursting of reservoirs, aqueducts, pipes, or other works constructed or maintained for the purposes of the special Act within the locality where the construction of a reservoir has been authorised, are contained in the following Private Acts—viz.:—

Manchester Corporation Act, 1879.
Birmingham Corporation Act, 1892, section 46.
Newcastle and Gateshead Waterworks Act, 1894.
Sheffield Waterworks Act, 1853, sec. 58.
Agreements scheduled to the Sheffield Corporation Acts of 1896 and 1907.
Barnsley Corporation Waterworks Act, 1896, sec. 33.
Bury Corporation Waterworks Act, 1889.

(11) A precedent providing for compensation to the county council and district committees thereof for all damage, &c., in consequence of the bursting or giving way of the reservoir, "or of the conduits of lines of pipes by this Order authorised, and of the flooding that may be thereby occasioned," is contained in sec. 31 of the Arbroath Corporation Water Order Confirmation Act, 1905.

(12) As regards a county council, it is difficult to conceive that they could be damaged otherwise than in respect of injury to highways.

A similar provision is contained in the Dundee Water Order Confirmation Act, 1905; sec. 17; also sec. 14 of the Stockport Corporation Act, 1905; sec. 39 of the Lincoln Corporation Act, 1908; and the Pontypridd Waterworks and Tramroads Act, 1908.

(13) A clause somewhat as follows is suggested: Any person, company, or other body authorised to lay and maintain aqueducts, mains or pipes for the supply of water, or mains or pipes for the supply of gas along, over or under any highway within the area of a local authority in whom the said highway is vested, shall make full compensation to the said authority for all damage and injury, losses and expenses whatsoever which the said authority may sustain by reason or in consequence of the bursting or giving way of any such aqueduct, main, or pipe.

It was moved—(*a*) That the recommendation of the Law Committee relative to damage to highways outside the Metropolis caused by the bursting of mains belonging to water, gas and other undertakings be dealt with by the council after they have had a report upon the matter from a special committee to be constituted of representatives of local authorities who are members of the council, but are not themselves undertakers for the supply of water or gas. (*b*) That the said committee be now selected."

The motion was declared not carried.

A Surveyor's Dilemna.—At last Saturday's meeting of Retford Rural District Council the surveyor reported that for the parishes of Babworth, Bothamsall, and Elksley, he had not a single roadman left, and he had to bring in labour from other places. The contractors for the supply of road material had given notice that, as the War Office had taken over their wagons and the railways would not convey slag at the present time, they were unable to supply material. It was decided to appeal for exemption for roadmen who were doing half time on farm work.

"THE SURVEYOR" SPECIAL ISSUE.

The Special Annual Issue of "The Surveyor" will be published on January 26th, and readers who propose to accede to our request for a short statement, for inclusion in the number, of the works projected by their authorities for 1917, will greatly oblige by making their return as early as possible. All other material, and particularly matter accompanied by illustrations, should likewise be forwarded without delay to ensure its appearance.

A Survey of Municipal Engineering.

By EDWARD WHITWELL, F.I.S.E., M.S.A., Engineer and Surveyor to the Abersychan Urban District Council, Lieut. R.N.V.R., President of the Institution of Municipal Engineers.

[Inaugural address to the Institution of Municipal Engineers.]

It is incumbent upon me to make my apology to you for my absence from the meeting at which the announcement is made of my election, by the members of the institution, to the position of president for the ensuing year; and my absence abroad, being one of special duty in the service of my country, will, I am sure, be excused.

In accepting the office of president of this most important institution, let me hasten to say how reluctant I was to allow my nomination for this premier place; how difficult I realised it would be for me to follow in the wake of the past-presidents, the first engineers of the day—and no institution has been so fortunate in its selection of presidents as this has hitherto—and how deeply sensible I am of the very high honour which has this day been conferred upon me. I only wish that I could have had the pleasure of being with you and of participating in the discussion of the very valuable papers which are to be read during the meeting; but, like most men of my age, I have responded to the call of my country.

For the third time you are to receive a presidential address during the great war, and, as on each occasion previously, so now is breathed the great hope that before a fourth occasion occurs a means will have been found to secure a just and lasting peace. Like other great institutions, you have contributed to Britain's wonderful and mighty Army men without whose success could never be achieved; men who in civil life were leaders of her engineering faculties, and who are now, from private to general, silently, nobly, and heroically striving together to reach the inevitable goal of victory, a victory which shall remove from Europe the possibilities of that menacing militarism which always finds its beginning in peaceful defence, but its end in frightful offence. Your Roll of Honour carries a great percentage of the names of your members, probably a greater percentage than any other institution in the land; and, sad to say, there are upon it the names of men who have sat by our sides, and who have laboured with us for the advancement of the sciences of engineering, who to-day lie cold on the field of battle. We mourn with those who mourn for them, we pray that they may find comfort, knowing that they have not died in vain. Our brothers are numbered among the nation's heroes, and they would not have chosen a less noble end while England's honour was at stake. We miss them from our counsels, and as England is richer by their noble sacrifice, we realise that she is poorer by their early death, for they counted among our most brilliant and learned members. Some of them, had they been spared to better purpose, might have served England to better advantage than the greatest heroism of the war.

We are now passing through the third year of hostilities, hostilities commenced to right a great wrong, a wrong which no nation in honour ever committed; and these hostilities continue while the accumulating wrongs, which commenced with the sacrifice of a comparatively defenceless nation, augmented by the Lusitania, Egypt and Belgium crimes, cry more loudly for vengeance due to-day, and strengthen the nation's determination to exact full reparation and so shatter for ever the detestable god of militarism which our enemies have worshipped for so many decades. And the heart of every member of this important institution is with the Government in the laudable and honourable task.

THE INSTITUTION OF MUNICIPAL ENGINEERS.

One of the innovations which marked the inception of the movement was the introduction of its valuable work to the smaller centres of population by the holding of many of the meetings in their midst, the annual meeting being held in the town from which the new president hailed; and this year an exception has had to be made to this practice because of the absence from the country, and the meeting in consequence is held in London, it being considered that London affords the best general facilities in regard to the great majority of members. This is one of the many consequences of the war, and one which, as a local institution we must suffer in silence.

As a member of the institution since its inception I have observed with increasing pride the healthy growth of its membership list. In the early days keen was the antagonism and scathing the criticism brought to bear against the new body of men which appeared to rise from the sea of engineering, men ranking with the first engineers of the day, and men hitherto unknown in the world of professionalism, men who were silently and efficiently steering the health destinies of important municipalities, but whose eminence and efficiency were overshadowed by the apparently greater and more obviously successful brother who was largely responsible for guiding the destinies of a kindred community.

Some of the criticism levelled at the institution at its birth was justifiable; part of it arose from a spirit of antagonism only, and had no healthy basis; part of it—though very little—arose from petty jealousy; but all of it has been experienced at the birth of every institution, and has been just as applicable to each of them as it has been to ourselves. It has been of great moment in shaping the destiny of this body, and has done more to produce the present healthy list of loyal and able members than any silent antagonism could have done. To-day as great a care is taken in the selection of its members as is taken by any other institution of equal importance; its examinations are the most practical in the municipal world, and in the result it is becoming recognised in the engineering world as a valuable training ground for coming engineers and the home of many of the most eminent. That there was a need for its existence has been proved by the great work its members have achieved; that it continues to exist after so many years is proof of its utility; and that it will continue to fill a void in the sphere of engineering is certain so long as every member constantly aims at the same high standard of efficiency, to carry out the aims and objects for which the institution was created, and to remember that his quota, however great or however small, is just as essential to its useful existence as it is to himself.

The institution continues to grow in usefulness and prestige; its membership list is even more satisfactory than it was a year ago; the council month by month scrutinises more closely the applications for admission to its ranks, the members contribute more loyally their papers and subscriptions; its past-presidents most faithfully continue their keen interest and very valuable assistance; the secretary pursues his tasks assiduously and faithfully; all these important factors are combining in building together an eminence in the engineering world which ranks in importance and utility with other institutions of a kindred character. To strengthen the institution, to make more firm its purposes, to bind the members more tightly into one great body, having for its object the welfare of its fellow-men, should be the aim of every member. No member should fail in these duties, if the institution is to pursue its healthy growth, increase its great usefulness, and add to its already enviable prestige.

SECURITY OF TENURE.

No presidential address can be complete which omits from its remarks the one vital theme, security of tenure. Just as it is necessary that a fruit-bearing tree should have its roots securely and firmly spread at the spot in which it has to grow and be fruitful, to prevent sudden squalls from limiting or abruptly ending its life of usefulness before that life has passed that stage, so should the engineer, who yearly continues to grow in usefulness and knowledge, to the benefit of the community he serves, be protected from the sudden local storms of indiscretion—and often malice aforethought—by having his office shielded and his position firmly rooted in the soil of permanent government. A tree which is insecurely rooted must always fail to yield its full measure of fruit, because of its struggles to retain its grip on the soil, and so it is with the engineer when all that is best in him is crushed by the unscrupulousness of slandering and libelling members who, though really not numerous, are generally very serious and determined in their animosity, on account of a fancied grievance, because the engineer has had to pursue unflinchingly the

straight path of duty. It is because this institution believes that men can give their best services when removed or protected from these vitality-sapping and incentive-lowering elements that it stands for security of tenure; because it too surely realises the inability of an engineer, however honest, highly intellectual, and accomplished he may be, to survive the really determined municipal opponent; and because it knows that this absence of security to one health official in the public service is quite as illogical as security for the remaining health officials is logical. Only one real argument has ever been advanced against the consummation of this ideal—that is that there are some appointed to public positions who lack competence—and protection for them would be injurious to the service; to which I would reply that every authority under the present system offers its appointment, at a salary it fixes itself, to the best applicant, and where it has failed to secure competence it will only be by reason of (*a*) offering such an inadequate salary as not to tempt a gentleman with any competence; (*b*) selecting a popular candidate instead of a competent one—two oft-recurring instances, to judge by the news of appointments. There is only one way to secure the removal of this public health inconsistency—namely, for every municipal engineer to unite in an effort to secure the passing of a Bill which will place the appointment, the payment, and the dismissal of officials connected with the public health in the hands of a central authority, and toward this ideal it is the duty of this institution and every member to aim.

SECURITY OF SERVING MEMBERS.

It is necessary to make some reference to the gallant members who have gone forth to battle for their country. I am not aware of there being a single member of the institution who failed to respond at the earliest opportunity to his country's call, and though few, like the majority of Britons, possessed any military instinct, they all possessed that love of country which prompts men to say, "Who lives if my country dies?" And the institution has great reason to be proud of them, their authorities are proud of them, and the Empire thanks them. But what of their homes, their mothers, their wives and their children? In every instance a loyal community said "Go, and you shall not suffer; your income shall be as before, and your place will await your return." That was two years or more ago, and still the war goes on. This institution appreciates to the full the deep loyalty of the municipal authorities of this country, and it believes that as the war lengthens in time so will the determination of the municipalities grow in intensity to keep faith with those who will return. As England's pledge to others was honourably kept, so let the authorities' pledge to those Englishmen who went to keep England's pledge be honourably kept.

MECHANICAL TRANSPORT.

Like all other departments in which the engineer exercises his activities, this is furnishing an ever-changing state in which his originality, research, and assiduity find ample scope. A few years ago the leading question was animal traction *versus* steam traction, but the wonderful developments which have taken place in the mechanical world have changed this completely, and now the controversy is entirely related to the form that mechanical traction shall take, whether it shall be steam, internal combustion, or electrical power. Like all other very old institutions, the use of the horse dies very hard indeed, and one fully expects to see, in another decade or two, a few authorities still using this animal for all classes of work with a much concentrated Rip Van Winkle air. That at the present moment there are many works in which the horse is more economical than the motor is very evident; but, one by one, with increasing experience, and with the numerous inventions tending to improve the power unit, they are fast appreciably lessening, and in all probability in a few years' time not many authorities will be found with unqualified allegiance to animal traction. At the present stage the consensus of opinion is that for very short journeys the horse still reigns supreme economically—though the electric vehicle is rapidly overhauling it—while for long journeys the power wagons are admittedly more efficient and economical.

As one who has made a keen study of this question, and has carried out numerous experiments with internal combustion and other engines, I am convinced that mechanical traction, both in theory and practice, has more than justified its being preferred to other forms of traction, and should be much more general than it is to-day; only the conservatism of the English character has prevented its full application. To those engineers who are about to change from the old system to the new, let me emphasise how necessary it is to be careful in selecting that type of vehicle which best suits the district. Do not be influenced by first cost when considering the power, and remember a hilly district requires a vehicle considerably more powerful than a flat district if its work is to be equally well done. Again, if the motive power is a petrol engine, an increase in the number of cylinders is far more preferable to an increase in their size, and will lead to smoother running, better hill climbing, less gear changing, and, of course, reduced wear and tear. To those who have municipal electrical supplies, electric vehicles are well worthy of consideration, as, with the later improvements in this department, electric propulsion is proving to be a very keen rival to the best known other forms of traction. The initial cost of an electric vehicle is higher than that of the other forms, and the available speed is less, though the latter will be found ample and quite sufficient having regard to public safety, while at the same time quite equal to legal limits. Its running costs are found to be lower; it is noiseless; it withstands the strain of starts and stops better; has fewer moving and wearing parts; is quick in acceleration without the sudden jar on gears, &c., while in control and maintenance it possesses none of the difficulties of the petrol engine. Of course, great advances are being made in the petrol-engine world, resulting in the production of types of engines which are revolutionary in character; and this has been chiefly due to the exigencies of aerial warfare. Comparing it with pre-war days, we find the weights about one-half of those which held previously, the efficiency nearly doubled, and the difficulties of control and maintenance considerably reduced.

Other developments are taking place, with which I am identified, to which it is not possible to refer at this stage, but of which some mention will be heard later when the results of much experimental research are disclosed.

While I do not wish to dogmatise, I venture the opinion that the traction vehicle of the future is more likely to have electrical power by reason of its being cleaner, less noisy, and more simple to maintain than any other; and there is every probability that it will be equally cheap. Its only rival will be the petrol engine, which, owing to the requirements of the war, has increased in efficiency by leaps and bounds. The steam tractor, to my mind, already has little place on the highway, and will in all likelihood soon be a relic of the past.

TOWN PLANNING.

Probably one of the most important matters exercising the municipal mind is that of town planning. In the past the prevailing selfishness of the great landowner has so permeated the mind of the lesser owner that the most minute exercise of public control or direction of privately owned land has been regarded as a wicked interference with the rights of the free-born Englishman, and in the result villages, small towns, and great cities have been laid out in a manner unworthy of the traditions of a great people, and still more unworthy of an intellectual community. Fortunately, a great change is taking place; the people are beginning to awaken to the value of beautiful surroundings, quick transport, and social amenities, and in place of the narrow, sunless thoroughfares, the gloomy environment, and the selfish disregard of the neighbour's welfare, is springing up the national realisation—alike in the landowner and the landless—that the happiness and prosperity of a nation lie in securing to its people the full measure of Nature's gift. That we are far from reaching this high-water mark is still lamentably apparent, however, and this is chiefly due, I think, to the inaccurate perspective of the municipalities in general, who, with limited vision, see only the immediate capital outlay, and are blind to the fact that the principal and interest are returned a thousandfold in the shape of health, happiness, and prosperity of future generations. The full, proper and necessitous solution to the consequent problems is only to be found by generally applying the powers already in existence on this subject, by sweeping away the adoptive clauses, simplifying the procedure, granting greater powers to the local authorities, and seeing that full advantage is taken of them.

HOUSING.

Year by year great strides are being made in this direction, and already one is inclined to be unsettled by the reflection that so much has been done in the last decade and so little for general use previously. Slowly, but surely, the conviction is growing that the

provision of healthy and pleasant environment about the home, with all the requisites for the good health of the people, is not to-day an act of beneficence on the part of the more fortunate brother, but a Christian and communal duty, which cannot help but be productive of marked improvements in the moral, physical and industrial well-being of the nation. That no individual should have a legal right, for his personal monetary profit, to condemn his less fortunate fellowman to live in a home and surroundings inimical to that man's and his family's well-being is now being more clearly recognised—yes, being recognised just as clearly as that the individual is really by his action not only helping to sap a future generation's vitality, but is assisting his neighbour of a robust, virile manhood.

That slumdom exists after so many generations of civilisation is creditable to neither civilisation nor the country which possesses it, and that this country is at last awakening to the great canker in its midst marks the most commendable discovery of our day. Too long has the false ideal of providing a man with these necessities of life, according to his means, been clung to, instead of the ideal conveyed by its converse. Let the converse be the ideal of the nation, and the progress made during the last decade, great as it has been, will be infinitesimal compared with that of the next. The welfare of a nation depends on the health of its people; hence, to permit of the existence or encouragement of that which is inimical to the people's health is tantamount to race suicide. One hears so much of the so-called housing problem, a problem which is not so much one of housing as of means, and so long as the genius of the property owner, whether municipal or private, is expended on how to erect dwellings according to the means of the tenant, so long shall we have this housing problem; it will never be solved on these lines. Once turn to the real aspect, once understand that correct and sensible housing accommodation—which must include all the essentials for health and all the securities from disease—is as vital to the well-being of the nation as it is to the individual, then, and then only, will it be realised that, instead of building to fit the means, it is necessary to fit the means to the building, to see that every individual has the means and the right to healthy and bright surroundings. In other words, the housing problem as we know it can only be solved by either enlarging the means of the workers or by the State contributing sufficient sums to make up the difference. As the former is, for economic reasons, almost impossible of attainment without social upheaval, it is evident that the latter is the only way, and the sooner the nation realises it the better it will be for the well-being of the English race in general.

TRANSIT FACILITIES.

How much the growth and really healthy expansion of a town depends upon its transit facilities is seldom realised in a municipal sense, and consequently in almost all districts these are left at the mercy—or shall we say to the prize of the speculative instincts of our more wealthy fellow-men. In the result we see communities extending themselves from the centres of industry in a much restricted manner, each individual mentally measuring the distance from the site of his proposed dwelling to the nearest tram-it point, and in turn each landowner crowding as many promising plots into an acre of ground as will tempt the greatest number of clients to his own monetary advantage. That there is something radically wrong in our system of municipal expansion is strikingly evident; that the vision of our inevitable growth of population is lamentably restricted is perfectly clear; and that the results are both wasteful and costly measured in the wealth of our manhood and the virility of our people does not admit of the slightest doubt. If only a broader and more extended view were taken, if the assessment of a district were as carefully provided for as the assessment of necessity be done when preparing for supplies of water, light and other necessities of life, then, but never sooner, would success. Is not this just what should be done?

Arguments can readily be advanced against the general provision of transit facilities, such as the sparsely populated growth of communities, the difficulty of transit and the expectancy, often, of engineering undertakings partly providing them, but these are only arguments and do not remove the necessity for the adequate provision, but only tend to point the cause. Where we reflect that the lack of their provision is often most due to the authorities in general not being the pioneers in enterprise, and we realise that generally speaking it is going to be found that the need is not known to have existed certainly before taking the step, we must conclude that nothing has lent itself more to the neglect of the healthy suburban and rural life and promoted the growth of the cramped, confined, sunless and airless existence than this mistaken policy of municipalities leaving speculative capital to provide that which is essential. Surely those things which help to build up a strong, healthy nation of contented people it should be the nation's obligation to provide; it should not be left to the speculative tendencies of a few. There was some municipal excuse for inaction a few years ago, but now when an authority can control the future development of its district, can allocate its sectional usages, restrict its malformation, and secure its correct design, there is none. It is only when an authority realises that that which benefits the nation as a whole is that which, under our present system of local administration, benefits its own people, that real progress is being made.

HIGHWAYS.

This very important part of the engineer's work looms more and more largely in the people's mind, and is one for which in its present transitory stage it is not so easy to lay down immutable laws as most laymen imagine. With the ever-changing and varied types of vehicle, which now use almost every kind of highway, it is found that it is impossible to lay on any one highway that kind of surface which is suitable to all, and it is fast becoming an accepted fact that a highway must be constructed with a surface that will suit best the major portion of the traffic which it has to carry. Again, it is found that this solution of the problem is not in itself conclusive, for other difficult factors immediately present themselves in the form of position of the highway, the physical characteristics of the district over which it passes, &c.; while the question of cost generally closes the door, in the municipal mind, on the best and most suitable forms. One thing is really most evident, although often overlooked by the carping critic of highways, and that is, that unless an adequate foundation is provided to any form of highway, good surfaces are the exception and not the rule; and how many of the existing highways, unless they have been constructed or reconstructed during very recent years, possess this adequate foundation? Another fact which must be understood is that the best forms of highway surface, given that other conditions are complied with, are undoubtedly the most satisfactory and the most economical, though much more costly than the old forms in initial outlay. Of course, it must be realised that the best form does not necessarily mean the most costly, but rather the most efficient, having regard to durability, imperviousness, noiselessness, and self-cleanliness. Personally, I regard the keeping of highway statistics as being as essential as the knowledge and use of the best materials, for without the former the use of the latter depends too much on mental observation and memory; but how many authorities realise the importance of this sufficiently to provide staffs adequate for effectively keeping such data?

Much controversy arises from time to time as to whether the main highways of the country should not be nationally controlled. There is much more to be said in favour of this than there was a few years ago, before the advent of the automobile, and when traffic was almost entirely local. Without doubt there are many arguments to be advanced in favour of this proposal now, particularly from those who use the roads in a national sense, and one is inclined to agree that if any change is made this should be the one. At the present time many urban authorities and almost all larger municipalities control the highways in their district which carry the through traffic; while, as is well known, the county councils control the remainder. In many instances the view is held that the county authorities are the proper authorities in any event. I do not think that any change should be made in this smaller sense, but rather in a national sense, as by that means the whole treatment of the main highways would be free from local influence; they would be more uniformly kept; their state, conditions and statistics more generously noted than when the local rate provided the means; and so they would, as is only right and reasonable, become a national charge.

In view of the ever-increasing shadow of national control, I think the contribution of a paper by some member of the institution on the arguments for and against the suggestions would be timely and a most valuable addition to the institution's records.

STREET IMPROVEMENTS.

One of the most striking lessons of municipal short-sightedness is provided by the realisation of the enor-

mous sums which have to be spent annually to widen, straighten and generally improve our existing highways, or to make new ones through congested areas. There is not a single community in the country which is not having to pay most heavily for the lack of foresight or the niggardliness of a past generation—and in many instances for the present one—and in some cases the sums having to be paid for properties which previously could have been acquired for a trifle are almost staggering. In the writer's own experience, he has found authorities having to provide 30 per cent of their revenue for this purpose, and when one realises this and looks to the experiences of large towns like Liverpool and Sheffield, one is surprised to find any sign of lethargy in seizing upon the provisions of the Town Planning Acts in order that future generations may be spared the enormous waste which is now being suffered.

Of course, it is evident that some sums must always be provided to remedy that which human judgment could not foresee, but there is no excuse for an authority which neglects to provide for a future generation that which the future generation will need in its turn, and as there is no surer, easier, or more economical way of doing this than by the preparation of a town planning scheme—a scheme which will in the present generation justify its execution a hundredfold—one must conclude that it is municipal folly not to take advantage thereof, and deplore the national blindness which prevents it from being demanded.

SANITATION AND INFECTIOUS DISEASE.

Everyone knows that dirt and infectious disease are synonymous terms, and although it was only during the conclusion of the last century that this became an accepted fact, some wonderful strides have since been made in the efforts to obliterate them from our vocabulary. That we shall never be perfectly free from all forms of infectious disease is almost an axiom, but that it can be reduced from the enormous proportion of human ailments which it forms is perfectly clear; in fact, were it within the province of this address to produce figures showing the progress made during the last forty years, their inclusion would provide some very striking contrasts.

Disease prevention is one of the departments in which the authorities are far ahead of the people in their knowledge of its importance, and have enacted by-laws and regulations which, if sensibly followed, would do much to stamp out entirely almost all preventable diseases. Unfortunately, the people are far behind; some of the lower classes are living in a sense far behind the Middle Ages, while others appear most reluctantly to drag themselves along far from the realm of precaution. It is not that they do not suffer for it—they do; and, sad to say, many others too who would do those things which are best. The authorities cannot be blamed, because they are performing their tasks often in the face of a diametrically opposing obstinacy which regards public interference as something akin to despotism; and is not an Englishman's home his castle? Much progress will have to be made in the education of the masses before infectious disease is practically stamped out, and I am rather inclined to the opinion that the most economical way of achieving the latter object is for the Education Committees to give sanitation an important place in their curriculum. If as much care were taken to instil into the youthful mind how to maintain health as is taken to instruct it in much less vital matters, hundreds of thousands of pounds would not be wasted in remedying that which could have been avoided, and more than that gained by the better health of the people. As is well known, many thousands are wasted in disinfectants to satisfy the sentiments of people who are in the habit of crying "wolf" at all times, and there is hardly a sanitary engineer but who is amazed at it. But what can be done? Public sentiment must be satisfied, and so tons of disinfectants are thrown annually in the drains and sewers of the country on the off-chance that there may be a disease germ with its mouth open waiting to be poisoned therein; and yet infectious disease is almost unknown among the sewermen of our great towns and cities; further, we know how the presence of disinfectants interferes with the natural processes of sewage purification, and makes that purification more costly and difficult.

SEWERAGE AND SEWAGE DISPOSAL.

The effective advances that have been made in this department during recent years call for much congratulation; but, great as the advances have been, many more are necessary before we can rest content in the belief that the problem has been finally solved. In the matter of sewerage, I think it may generally be conceded that we are nearing the final disposition of all doubtful problems, and if other departments of public service, which are equally vital to the welfare of the dwellers, were on as satisfactory a basis, our death, infectious disease, and kindred rates would show a much more satisfactory condition of things.

Perhaps the most oft-debated matter in connection with sewerage is the disconnecting trap, the evolution of a day of royal and national grief, and which, though eminently effective in its primary purpose, is woefully dangerous in other directions, and responsible for more than 90 per cent of the evils in connection with modern drainage. Some day we shall discover that at last bureaucracy has bowed its head to the consensus of professional opinion, and then, a few years afterward, we shall pause to wonder how such an illogical contrivance, in which the remedy intensified the troubles, could have survived so long.

While in the department of sewerage great improvement has been effected, it is unfortunate that so much real progress remains to be recorded before the problem of sewage disposal is properly solved. Experiments extending over long periods have been made; commissions have sat for years and reported years later, largely with good results—although without full effect, because some of the information was almost out of date by the time it appeared, and also because some of it lacked the definiteness which a national commission should provide; statistics have been compiled which, owing to the varying circumstances in each case, lose much of their value when setting standards therefrom. And yet, in spite of these things, we seem to be far from effecting the purification of sewage satisfactorily, and at the same time economically, on lines applicable to all districts. The absence of standard degrees of purification is another fruitful source of difficulty, and in my own experience, difference of opinion among engineers, the weakness of a county council, and the indecision of the Local Government Board, led to the useless expenditure of many thousands of pounds in the promotion of rival Bills in the House by different local authorities for the drainage and sewage disposal of the same area. It is when one realises these things that one has the truest conception of how far we are from accurately defining the correct lines for success, and, further, it is such instances as the one given that do more to call professional attention to the unsatisfactory condition of the question, with its consequent wastage of public money, than the multiplication of costly experiments can ever do. The engineering world, however, owes much to the courageous pioneers of sewage treatment, and though the war has set back the clock for a period, one is inclined to the belief that their successors are approaching the question from much more satisfactory standpoints than formerly, and that more gratifying results will accrue in the near future.

(To be concluded.)

Women and Road Work.—Women are being employed on highway work at Walton-on-Thames.

Substitution Scheme for Municipal Tramways.—The Municipal Tramways Association announces that arrangements have been made with the War Office for the establishment of a substitution scheme applicable to tramway undertakings for dealing with employees of military age.

Water Supply from Melted Snow.—A project is being undertaken in the State of Arizona by which an arid desert district is to be watered with the melted snows of a neighbouring mountain range. The scheme involves a collecting ditch situated in an impermeable clay stratum to intercept the water flowing down the mountain slopes, with two storage basins evolved from old volcanic craters. Pipe lines totalling 90 miles are to be laid to serve the area. The capacity of the two reservoirs amounts to 920,000,000 gallons, and the total annual supply will be 2,000,000,000 gallons. The distribution will take place entirely by gravity. The pipes are of sheet iron, each length having a bead or ridge stamped around each end. The end of one pipe is heated to enable it to slip over the adjacent pipe, with the hollow bead of one fitting over the raised ridge of the other. On cooling, the pipes are locked together. The total cost of the installation is estimated at £25,000. This will solve the difficult problem of supplying water in the district, where all potable water has to be drawn in by rail in tank cars. So little water was available that in some towns the effluent from treated sewage was used to sprinkle lawns and in boilers.

Practical Road Work: A Day Out of the Office.*

By GEO. RODLEY, District Surveyor, Norfolk County Council, North Walsham.

The writer of this his first paper, hopes that the opinions and ideas set forth therein will, if not quite meeting with general approval, be of some little practical service to a few of the members and students of our profession.

Most of my details are given from an "outside" rather than from an "office" point of view, and thus may be, as I hope, of great use to those assistants among us who get very rare opportunities of seeing the actual work carried out. In many offices the assistant surveyor and pupils have the bulk of their time taken up with work for which an office boy should have been engaged, such as correspondence, wages accounts &c. It is a red-letter day if they can go round the work occasionally. To such I would say: "Come along; let's go round the jobs to-day—leave your booking for another day."

FOOTPATH FLAGGING.

Now, the first work we come to is a piece of new footpath flagging—one side of the street with natural flags and the other side with artificial flags. We will see the artificial flagging first, because a gang of men is at work on each side. The flags are set up in stacks on their edge, and the sizes are 2 ft., 2 ft. 3 in., 2 ft. 6 in., 2 ft. 9 in., or 3 ft., according to the width of footpath, but all the flags are 2 ft. wide. The usual crossfall from back or building line in this class of work is ¼ in. to the foot, so that if the path was 6 ft. in width the back line would be 1½ in. above the level of the kerb. After the crossfall has been determined a chalk line is strung along the back showing the level of the finished flagging there, and the tradesman commences laying flags on a prepared bed of good hard, fine boiler ashes. His first flag is laid against the kerb, with ½in. lip above the kerb, and at such a level that a straight-edge placed on it will just touch on its underside the chalk line on the back, after the flag has been consolidated with a beetle, or mall. This is done until that course of flags is laid. Then the next course is laid so that there is at least 6 in. of break in the joints. That is to say, starting from the kerb the first flag in the first course may be 2 ft. 6 in. in length. Then the first flag in the second course should be either 2 ft. or 3 ft. in length. The best work is obtained by arranging the joints so that they are continuous "hit and miss." This is most pleasing to the eye. In bedding the flags it is usual to place a trowel of mortar under each corner, and then beetle the flag down carefully—more with a rub of the beetle than with a blow—until it is consolidated and true with the back line. In some towns the joints are afterwards grouted with cement and sand, and in others they are simply grouted with sand. For many reasons I prefer the latter system, especially in large towns where services exist for gas, water, electric light, &c. If the joints are grouted with cement and sand it often means that in taking up one flag five or six are broken.

We will now cross the road to the other men who are laying the natural stone flagging. The bed is prepared in the usual way, and the back line is set out in the same manner, except that it is usual to allow a crossfall of ½in. to the foot, so that a footpath 6 ft. wide would be given 3 in. of crossfall. The most practical way of laying natural flags is, in my opinion, to lay them as the rough-cut, not tooled or squared. The semi-skilled masons can square them on the road to whatever fine joints are required, and in laying flags to a gauge a great saving is effected. No tooling is required, the flags being laid according to the irregularities. Any that are twisted on the bed can be levelled afterwards by an apprentice sitting on a bag on the path.

STONE SETTING.

The next work we will see is the steam roller going on dry macadam. In this case the old surface may be torn into wheel tracks, and then the tracks are slightly scarified and fresh material put in to bring up to the proper contour with the surrounding surface, and well rolled and bonded. By common material I do not suggest rubbish, but old granite setts broken to about 2 in. gauge or granite spall roughly broken. The whole of these operations being spread shovelful by shovelful—not dumped down in cart-loads and levelled haphazard. No binding material should be added until the surface material is well rolled and interlocked. The binding material should be clean, but not too sharp. Only sufficient water should be used to work up a "lather." After the road has been left for a few days it should be spread thinly with chippings and dry-rolled. In my opinion, nothing less than a 2-in. stone should be put on in coating.

PATCHING.

It many times happens that, either because a roller is not available, or because the patches are not large or numerous enough to warrant a roller being sent a long distance, patching has to be done and the work consolidated by the traffic. I refer chiefly to pot-holes. Unless a keen watch is kept many men have a tendency to dump the patching material into the depression without scarifying it. By scarifying the old surface is toothed and will better allow the new material to lock into it. The patch should be left very little higher than the old surrounding surface, but in any case the edges should be feathered to the surrounding surface.

TAR-PAINTING BY HAND.

The success of this depends on securing the proper weather when carrying out the work. I have in mind a length of road I treated a few years ago near a railway station. Trains were running at very short intervals, and there was in consequence almost a continuous stream of taxicab traffic over this particular piece of road. The usual procedure had been to apply the tar over half the road, and as it was applied to follow up with chippings, and let the traffic over immediately. But when I treated it I put barriers across each end of half the road and barrels along the centre.

After horse-brooming and sweeping with soft brooms I commenced applying the hot tar on a warm day and treated about three-fifths width of the road by about 5 p.m., but applied no chippings during the day. I left the tar to "boil in" with the sun. When the men had finished applying tar their work was absolutely dull black—no shine whatever. I then told off four or five men to apply chippings. In the mean-time that tar had penetrated. In my opinion, by applying chippings immediately after the tar, and opening to traffic, that tar has no chance to penetrate, and the wheels of vehicles pick up the chippings and tar and leave a bare patch or streak.

Warning notices should be set out at least 100 yds. from each end of the work, with intermediate warnings at junctions to give sufficient time to enable fast traffic to slow up. The writer has seen many notices which even a pedestrian could only read by stopping a few seconds. In these times we must cater for the fast traffic in the matter of road signs and warnings by having them printed in bold letters and to the point, and in as few words as legally necessary. Instead of the usual warning, "Tarring in Progress—Cyclists Advised to Walk," I strongly advocate some such wording as "Beware! Wet Tar," in large white letters on a red ground.

Before tar-painting is commenced the road should be examined, and all depressions made good, either with tarred chippings, or thoroughly dry chippings rammed into a flux of tar, and then washed over with tar. This should be done two or three days before the actual work of tar-painting the whole surface is commenced. A great saving is effected by tarring all sharp bends or curves on dry macadam roads. When motors take these sharp bends there is always a certain amount of side-scrub with the tyres, and I have proved this tarring to be a great advantage and saving to the roads. The Norfolk County Council have done this for some years, and I would strongly advocate their system.

STREET WATERING.

This is one of the most important branches of the highways department, and unless under systematic control complaints will be constantly coming in from tradesmen. The town should be divided into routes, so as to avoid overlapping. A list of these routes should be kept in the office, and also a copy posted in the stables. The drivers soon "pick up" these routes.

* Paper read at the annual meeting of the Institution of Municipal Engineers [illegible].

and instead of having always to give the driver a list of streets, it is only necessary after a little time to say to him: "Oxford-street route," or "Borough-road route," as the case may be.

SNOW CLEARING.

In this, too, the town is divided into routes. But in the case of crossings near railway stations, works, &c., the men required are given to understand before winter sets in that they are to go direct to those points instead of going as usual direct to the depot for instructions. These men should be allowed to keep a shovel, scraper, or broom at home during winter, so that they can go straight to work. From the depot the permanent workmen are sent to different points with one or two "casual" men, and each gang starts in the most important streets and works outwards. The channels should be kept clear, so that in case of a quick thaw the water can get speedily away. The snow-ploughing routes should also be posted in the stables.

A rotary broom is of no use in snow clearing, but when a good thaw has set in, if it is set to work at the right time, has excellent results. Care must be taken that no further brooming is done if there is the least sign of a frost. It is much better for a horse to travel over frozen snow-broth cut up with the previous days' traffic than to face a road which has frozen on a smooth surface.

All snow ploughs and snow-clearing tools should be overhauled before the end of October, so that repairs can be carried out and renewals obtained before the snow comes.

GRITTING ROADS IN FROSTY WEATHER.

In this matter, too, a system is of supreme importance. Certain places in the town are always more susceptible to frost than others. Certain paths leading to works are unfit for work men and women to walk upon at 6 a.m. Roadways over bridges or near stations and wharves are not fit for a horse to be driven along. Where these places are known certain men should have instructions before the winter sets in as to their routes. Before November the job-masters, &c., in these localities are approached for permission to store a small quantity of grit on their premises (under cover). Certain of the workmen who live close by have instructions to go to these, the worst points, and commence gritting as early as possible. If for footpaths, he carries a pail full of grit and spreads it from his hand on the path. If for roadways, he uses a barrow and shovel. In the case of roadways very little grit is required; in many instances just two tracks for horses are sufficient. I have never experienced difficulty in obtaining permission to store the grit on private premises, because the job-masters feel assured their horses will have a good start out on a bad morning.

Instructions should be given to the foreman that if a severe frost threatens during the afternoon, one or two carts should be filled with grit and set up under a shed overnight, thus saving loading time in the morning.

FOUNDATIONS TO ROADWAYS.

These are to a great extent governed by the locality. In the ironworks districts slag is the best and cheapest material obtainable, and in the neighbourhood of stone quarries, rubble. All foundation material should be "paved" in by a sensible labourer by hand. The writer has seen tons of foundation thrown in with the shovel, and it has all had to come out again. Each stone should be paved resting on its broadest side and "tooth up." The interstices can be filled in various ways. The projecting teeth are nobbled off by one of the men and are knocked into the interstices. If more material is required to lock the foundation together, I find one of the best materials is old macadam, either ordinary or tarred, which should never be wasted, but kept in the depot for such purposes as this.

A good steam roller should be used and kept continually on the move. A good coat of hard boiler ashes should be spread over and brushed in. In all cases, whether the road is to be paved with setts or coated with macadam, the foundation should be finished to the same contour as the finished surface.

This walk round the work will, I hope, have been interesting to those who, in imagination, have accompanied me, and although there are one or two more works in progress time will not allow of a visit to-day. Perhaps some other time we will have another day out together.

When this war is over there will no doubt be such a great amount of work to be done on our highways that more opportunity will be given the assistant to get among it.

Since writing my paper I have noticed a "bull." I have presumably visited a tar-painting gang and the other gangs on the same day that snow-ploughs are out! This, I think, you will overlook. My idea in bringing snow clearing and gritting into the paper was because the season for this work is close upon us.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Is it not curious to notice how Nature so often tries to thwart man's efforts to improve his surroundings? Do we not find an example of this when we read that recently the Legislative Council of Burmah has been obliged to promote a Bill in an endeavour to eradicate the water hyacinth, a plant, or weed, which threatens to choke all the rivers and waterways in that country? Is not the same evidence of Nature's desire to override everything observable in a smaller way when we see how on many of the waste pieces of ground, where buildings had formerly stood, in the heart of London, or in other large cities, wild flowers, weeds, and grasses begin in a very short time to spring up and grow profusely, if left alone? Where do the weeds come from?

* * * *

Cannot most engineers truthfully say when they have executed some work, "If the job were done over again many improvements could be introduced?" Was it not very bold of Mr. Rand to acknowledge this in a paper he gave on "The Oregon City Water Pipe Line," recently, and is it not evident to an observant engineer that this must be a fact in nearly every work that is carried out? Should we ever make much progress if this were not so?

* * * *

Did not Mr. Binnie, the new president of the Institution of Sanitary Engineers, delight his audience the other night with his inaugural address—which dealt in detail with the ancient water supplies of Rome and the modern water supply of New York? Was not the subject well chosen by an engineer whose firm is so world-renowned in connection with water engineering, and was it not full of information which will be interesting for all time?

* * * *

Is it quite fair to expect that all the money required for the necessary scientific research work in this country should be supplied by the Government, or, in other words, from the pockets of the already over-burdened taxpayers? Do not the manufacturers and traders derive enormous benefits financially whenever scientific research discovers some better or more economical method of production or manufacture, and would it not be more reasonable to expect that the manufacturers and producers should conduct their own researches at their own expense rather than look to the taxpayers for assistance?

* * * *

Is it not rather interesting to note that in the definition of a civil engineer in the charter of the Institution of Civil Engineers of the year 1828, the construction of roads comes first in importance on the list, and is placed before bridges, aqueducts, canals, and so forth? Is it not acknowledged that this old definition of a civil engineer holds good at the present time? If this is so, should not the road engineer be very proud that he should thus be placed in the front rank of the profession?

* * * *

Are not some very queer and original things done in America? As an instance of this, is it not interesting to read that in California a young live aligator is used to drag a rope through the choked sewers, and thus enable a chain to be dragged through afterwards in order to scour and cleanse them?

* * * *

Is it not evident from the extracts given in THE SURVEYOR of the 5th inst. of Mr. Robinson's report on scavenging in Bolton-upon-Dearne that privy middens are not only insanitary, but expensive to empty and cleanse? Is it not surprising that these insanitary abortions should still be allowed in some of our cities and towns? And now that Mr. Robinson has so clearly shown that they are expensive to the ratepayers as well, is it not to be hoped that the continuation of such monstrosities will not be allowed and that their construction is doomed?

Some Notes on the Uses of Electricity in Municipal Engineering.*

By HORACE BOOT, M.I.E.E., M.I.MECH.E.

The object of these notes, which cover only a general ground of the subject, is to the purpose of promoting a discussion upon the uses of electricity by municipal engineers and surveyors, as during my professional career I have been somewhat struck with the lack of general knowledge shown on several occasions; but when one remembers the multifarious duties that a town surveyor and engineer has to carry out, it is not surprising.

Some of the uses to which electricity can be put to for the service of the public, and which affect the borough surveyor, are :—

Electric tramways.
Street lighting.
Telephone and telegraph poles and wires.
Street fire alarms.
Electric power for all kinds of mechanical work required in municipal engineering, such as—
  Waterworks pumping;
  Sewage pumping;
  Electric lifts in municipal buildings; and
  Electric vehicles for dust carts, fire engines, and other municipal requirements.
Electricity for power purposes in farming, which in rural districts will probably play an important part in the future.
The sterilisation of water, and the production of disinfectants.
The protection of chimneys and high buildings against lightning discharges.

It must be apparent from this list that a borough engineer's and surveyor's knowledge on the above subjects can only be general; at the same time, he is often called upon to advise his council, and probably they expect him to erect works and to carry out any of the above duties in his department.

In the case of a large borough, many of these duties can be undertaken by the electrical engineer; but where a borough employs no electrical engineer, the surveyor would be well advised to consult some expert, just as the town clerk always obtains counsel's opinion on difficult legal questions or problems somewhat outside his sphere.

I have often heard of cases where the borough engineer has been blamed by his council for starting certain works which have been a failure; and in conversation with that engineer I have suggested—[illegible] he had adopted the town clerk's method, and had a expert advice? His reply has usually been that the borough or district would not pay for such advice. If the council are of such a parsimonious character that this is the case, then it is grossly unfair to blame the borough engineer and surveyor for such failures.

TRAMWAYS.

Dealing first with tramways, in large boroughs and cities it is usual to employ a special tramway manager and engineer; but even then the borough engineer should understand a certain amount about tramways, in order that the two of them may work harmoniously together. Tramways in large towns are a public necessity, although it would often be better, instead of carrying them into remote parts of the town, if a motor bus or trackless traction service were started. Capital would be saved and the remote districts would be served just as well. In small towns and in some rural districts tramways are run by companies, in which case a general knowledge of the working of tramways, the damage done to the roads, the extra cost of repairs, all come under the borough surveyor's notice. The question of supplying [illegible] districts or adjoining districts should be tramways, railless traction or motor omnibuses is best left to the decision of the borough surveyor, who would be assisted by the tramway engineer, but it is too much to expect the surveyor to take this additional responsibility upon himself, as if everything goes well, he receives little thanks, whereas if it goes wrong it often costs him his position.

STREET LIGHTING.

In street lighting the surveyor has two classes of illuminant, as a rule, to deal with—electric light and gas—and there is no doubt that, for many purposes, electric light is superior to gas for street lighting. On the other hand, electric light in a town may be too dear and gas may be reasonable, in which case the surveyor would naturally recommend his council to use gas. From the point of illumination, candle-power for candle-power, there is little to choose; but it must be borne in mind that when adopting incandescent gas the candle-power rapidly deteriorates, as well as being unsatisfactory in windy weather. It is also affected by insects, so that there is likely to be a more normal illumination under all weather conditions obtained in streets lighted by electricity. Where, however, the town owns electricity works, and not gasworks, then there should be no hesitation which to adopt. For the lighting of inside premises, electric light is undoubtedly superior and safer, and for that reason nearly all municipal buildings are lighted by electricity.

With regard to heating by electricity, the same does not apply, and, unless the rooms are confined and badly ventilated, gas heating is cheaper than electricity, and more satisfactory for municipal buildings. The lighting of public signs and street names might receive much more attention than it does at present. As far as possible, private interests should not be allowed to render the streets and buildings unsightly by ugly signs, and it was noticeable that just before the war there was a tendency for this class of advertising to increase rapidly.

TELEPHONE AND TELEGRAPH POLES AND WIRES.

With the unsightliness of telephone poles and wires, surveyors have been troubled for years, for the Post Office never seem to consider the beauty of the place, and often place their poles without considering the convenience of anybody. Beyond guiding his council in this respect, the surveyor has, unfortunately, little power; for often, what with the powers possessed by the water company, the electric power company, the Post-Office telegraphs and telephones, it is impossible for him to keep the roads in proper condition, for someone is always taking up the road for one purpose or another. It has often appeared to me that there is a shocking waste of money and want of organisation in this respect. I feel that some power ought to be given to the borough engineer and surveyor to prevent this, and, except in great emergency, to only allow the roads to be disturbed at certain times, and then only after giving proper notice, in order to, as far as possible, open the road for several purposes at the same time.

The question of municipal telephones, unfortunately, seems to have been killed by the Post Office authorities, for if one refers to the Treasury "Minute," dated May 8, 1899, it was then the intention of the Government, on account of the unsatisfactory service given by the National Telephone Company, to permit municipalities to establish their own telephone undertakings, and with the exception of Portsmouth, Hull, Tunbridge Wells, Brighton, Glasgow, Huddersfield, few of the towns seem to have taken these powers seriously. In my opinion this is unfortunate, for telephones are distinctly a local business, inasmuch as it has been proved that 95 per cent of the calls in any town are local, the remaining 5 per cent being trunk calls. Where the municipalities did establish telephone systems, subscribers got lower rates, a better and more efficient service, with the natural result that a much larger percentage of ratepayers became telephone subscribers. It is, unfortunately, too late to [illegible] this question again, for the Post Office see that it would have probably ruined their own telegraph department, and have always looked with a jealous eye upon it, so have made the telephone business a Post Office concern, with the result that the telephones were never more unsatisfactory than they are to-day; that the rates were never higher than they are to-day; that the inattention to the complaints and difficulties were never more apparent than they are now; and, finally, that what might have been a most successful cheap telephone system for every town has been done away with. When the Post Office took over the telephones we were

promised all kinds of improvements. Experience has shown that it would have been far better to have left the telephone industry with the old National Telephone Company than to have handed it over to a Government Department! It is to be hoped that some future time after the war a Telephone Subscribers' Protection Association will be formed, and that it will do really good work in making the telephone department realise their responsibility to the nation and to their subscribers.

STREET FIRE ALARMS

should be installed in every large town, for they are efficient, not costly, and can be placed under the control of the borough engineer and surveyor.

ELECTRIC POWER

forms such a very big branch of electrical engineering work that I can only mention a few of the uses in which electric power would serve the borough surveyor. One of the advantages of the utilisation of the electric power is that it can be controlled at a distance, which for waterworks and sewage pumping is often invaluable. For waterworks pumping it is admirably adapted, and has been extensively used by several engineers; for sewage pumping it is also admirably adapted, and is more largely used to-day than the average man is aware of.

ELECTRIC VEHICLES.

Electric vehicles are likely to increase, and for such purposes as dust-carts, fire engines, motor lorries for town use, they are hard to beat, either in the expense of running or depreciation. They are coming into much more general use in America, and I am of the opinion they will do the same here when their good qualities are appreciated.

ELECTRICITY FOR USE ON THE FARM.

It may interest you to hear that in America and on the Continent the use of electricity on the farm is making rapid strides. In a farm near Grand Forks, since 1911 electricity has been used for lighting and power purposes. Sixty cows are milked twice a day, the machine for it being driven by electric motors. Motors are also used for threshing, feed grinding, wood sawing, water pumping, and a 35-h.p. portable motor is so arranged that it can be plugged in at many places on the farm to perform various duties.

Another instance, according to the *American Electrical Review*, states that 40,000 acres are cultivated with the electric plough, and that on this farm there are no less than 180 motors and 5,000 lamps connected. In the purely agricultural State of California statistics show that per head of population electric power is used in larger proportions than in any other American State.

In Hereford (England) the city electrical engineer has been encouraging the use of electricity for agricultural purposes with satisfactory results. He finds that the cost of supplying power, in spite of the distances, is not prohibitive. The power works are supplying a farm 3,400 yds. distant from the electricity works, of which 1,200 yds. is by overhead lines, and the cost does not exceed £110 per mile capital outlay, including wire, poles, and labour. On this farm, which is supplied by the Hereford Corporation, milking is done by an electric motor, which drives the vacuum machine; the plant has a capacity for milking eighty-eight cows, and requires about 1½ h.p.

In this district, for agricultural purposes alone, the following horse-power are required:—

Cider making	160 h.p.
Milling	142 h.p.
Farmer's supply	106 h.p.
Water pumping	157 h.p.
Saw milling	130 h.p.

The motors for which are situated on various farms.

As farming is likely once more to become an important industry in this country, everything should be done to promote its success, and the serious increase in the prices of food should convince us as a people that no agricultural land should be left idle, and steps should be taken to put it all under the plough or to some other useful purpose.

STERILISATION OF WATER AND PRODUCTION OF DISINFECTANT.

The sterilisation of water and the production of disinfectants has not been taken up very much, but the medical officer of health for Poplar is a strong believer in it, and has from time to time written a number of papers on the subject, in which he claims that it is cheaper than ordinary disinfectant and more satisfactory.

PROTECTION OF CHIMNEYS, ETC.

The protection of chimneys and high buildings from lightning discharge does not come within the powers of the borough engineer and surveyor, unless he can show that there is danger, and that that danger is apparent. It is quite true that the number of accidents due to this are not many. At the same time these could be prevented if the borough surveyor had the powers to occasionally inspect and see that the lightning conductors on high buildings were in good order. However, far be it from me to add any further duties to the borough surveyor and engineer, for in my municipal experience he is one of the most overworked servants of a corporation.

In conclusion, I must apologise to the members for only dealing in generalities; but to go into detail in any of the above uses of electricity would involve a very long and technical paper, which I have, unfortunately, neither the time to write nor the courage to inflict upon your patience, but I hope some of the topics mentioned will lead to a useful and interesting discussion.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRY HELD.

Edinburgh T.C. (January 8th. Mr. David Ronald).—This was an adjourned inquiry with reference to the proposed town planning scheme for the Duddingston area.—The commissioner heard evidence in support of the case presented in opposition to the scheme by the Mid-Lothian County Council. Mr. P. R. M'Laren, sanitary inspector for the county, stated that there was no foundation for the suggestion that there would be building activity after the war. All the conditions were against it. Mr. W. Ellicott, county road surveyor, stated his opinion that generally the roads in the area were sufficient for the present traffic. The county had not put in operation their compulsory powers of acquiring land for road widening. Mr. A. G. G. Asher, county clerk, said the view of the county council was that the area was not ripe for town planning. Mr. John Ramsay, general manager of the Niddrie and Benhar Coal Company (Limited), said they would be handicapped in their business if the local authority were to dictate to them where they were to put their houses. Counsel then addressed the tribunal.

APPLICATIONS FOR LOANS.

Hereford T.C.—£63,300 for additional electricity plant and mains.

Paul U.D.C.—£1,000 for the Newlyn water supply.

LOANS SANCTIONED.

Willesden U.D.C.—£5,000 for a new feeder electric cable.

Glasgow T.C.—£500,000 for electricity extensions.

SASKATOON PUBLIC SERVICES.

By C. J. YORATH, Assoc.M.Inst.C.E.,
City Commissioner.*

The three utilities owned and operated by the City of Saskatoon, Canada—viz., (a) electric light and power, (b) waterworks, and (c) street tramway—are run upon strict business principles. The council refrain from allowing any local political considerations to militate against their successful operation, and in consequence the citizens are given a cheap and efficient service. The policy of the administration is not to build up large profits, but to place each utility upon a paying basis after allowing for all charges, including sinking fund, interest, and depreciation.

ELECTRIC LIGHT AND POWER.

This utility was established in the year 1908, and has steadily progressed since that date, necessitating the commencement of a new plant in 1911, which was completed in April, 1912. The total output in 1912 was 1,096,147 kw. hours, which increased to 8,456,940 kw. hours in 1915.

The following is a summary of operating costs, fixed charges, and revenue for the years 1913 to 1915:—

	1913	1914	1915
Operating expenses ...	$242,601·59	$205,387·39	$167,418·04
Depreciation, interest and sinking fund ...	74,045·00	96,641·75	99,692·66
	$316,646·59	$302,029·14	$267,110·70
Revenue	347,201·76	340,628·08	275,130·11
Profit	$30,555·17	$38,598·94	$8,019·41

It will be seen from the above that the operating expenses have been reduced from $242,601·59 in 1913 to $167,118·04 in 1915, a reduction of $75,183·55, or 31 per cent.

The smaller revenue in 1915, compared with 1914, was principally due to the reduction in the rates charged consumers for lighting purposes, the old and new rates being 9, 8 and 7 cents, and 8, 7 and 6 cents per kilowatt hour, respectively.

WATERWORKS—SUPPLY AND DISTRIBUTION.

The city is extremely fortunate in obtaining such an excellent and inexhaustible supply of water from the Saskatchewan River, and while in this respect it is better off than its sister cities of Regina and Moosejaw, it is not so fortunate as other cities in the east, which are able to obtain their supply by gravitation. In Saskatoon the water has to be pumped from the river to sedimentation basins, passed through mechanical filters, and then pumped to the distribution mains. In consequence of this, the cost to the consumer is slightly higher than that charged in cities which have a gravitation system.

However, during the past three years the system has been reorganised, and the operating costs reduced to a minimum, with the result that the charge for water supplied to domestic consumers has been reduced from 30 cents to 25 cents per 100 cub. ft., and the meter rent of $2 has been discontinued.

A summary of the operating costs for the years 1913, 1914, and 1915 is as follows:—

	1913	1914	1915
Operating expenses	$97,375·65	$65,295·30	$54,025·31
Depreciation, interest and sinking fund	23,133·66	26,566·36	24,241·45
Total	$120,509·31	$91,861·66	$78,266·76
Revenue	124,623·01	108,601·26	87,517·59
Profit	$4,113·70	$16,739·60	$9,250·83

It will be noted from the above figures that the operating costs have been reduced from $97,375·65 in 1913 to $54,025·31 in 1915, a reduction of $43,350·34, or 44 per cent.

This large reduction in operating costs has been made principally by (a) Stopping leaks and preventing waste; (b) amalgamating the pumping and filtration plants; (c) providing an electrical instead of a steam stand-by for the pumps.

STREET TRAMWAYS.

The street tramway was completed in the latter part of 1912, and commenced operation in the early part of 1913. The total track mileage on a single track basis is 10½ miles, and the average number of cars operating is 14·6. The original fares were six tickets for 25 cents, but these were altered in 1915 to a uniform five-cent fare. The alteration has undoubtedly meant an increase in revenue rather than a decrease in the number of passengers carried.

A summary of the operating costs, fixed charges, and revenue for the years 1913-1915 is as follows:—

	1913	1914	1915
Operating expenses ...	$137,334·11	$126,429·27	$106,938·26
Depreciation, interest and sinking fund ...	40,818·05	51,876·35	50,558·16
Total	$178,152·16	$178,305·62	$157,496·42
Revenue ...	158,487·33	144,996·93	126,522·50
Loss	$19,664·83	$33,477·56	$30,973·92

The operating expenses have been reduced from $137,334·11 in 1913 to $106,938·26 in 1915, a reduction of $30,395·85, or 22 per cent. In spite of the reduction in operating costs, however, the loss has increased from $19,664·83 in 1913 to $30,973·92 in 1915, due to the falling off in revenue during the first six months of the latter year. The revenue during the current year, however, has so greatly increased that the street tramway is now being operated at a profit.

* Extract from Annual Report.

ROAD REINFORCEMENT.

THE ADVANTAGE OF WIRE FABRIC.

In the November issue of the artistic booklet "Road Reinforcement," published by the British Reinforced Concrete Engineering Company, Limited, 1 Dickinson-street, Manchester, and 20 Victoria-street, Westminster, particulars are given of an instructive test under static conditions of a concrete slab reinforced with wire fabric similar to that used in road foundations and concrete roads, showing to what extent a slab of this kind may be bent before breaking takes place. The length of the slab was 18 ft., being 12 ft. between the supports, and having an overhang of 3 ft. at each end; the width was 4 ft., and the thickness of concrete only 4 in. It is not suggested that this is a sufficient thickness for main road traffic, although a reinforced foundation 4 in. thick constructed on the main road carrying London 'bus traffic at Chadwell Heath is acting apparently as well as an adjacent 6-in. foundation similarly reinforced. The test slab is shown in a photograph carrying a load of 21 tons of cement. "This," states the article, "is not an exceptional test for a slab reinforced with wire fabric, and if the test load is removed before breaking, the slab, owing to the high elastic limit of steel wire, recovers the greater part of its sag. A slab similar to that shown in the photograph, but reinforced with plain steel rods in place of wire fabric (and of equal weight) broke with a load of 13 tons. A slab entirely unreinforced, even if 15 in. thick, would, over a similar span, barely carry the same load as the latter. Such is the comparison between concrete reinforced with wire fabric and concrete unreinforced under the test of a static load; but a static load test does not bring out the comparison to the full. It is only under shock loads, such as those of fast-moving traffic, that the tensile strength of the reinforcement has its highest value, and the advantage of the wire fabric is most marked."

THE SURVEYOR'S BONUS.

AN INDIGNANT RURAL COUNCILLOR.

At the last meeting of the Ellesmere, Salop, Rural District Council, the surveyor, Mr. W. H. Owen, made an application for an increase of salary, or a war bonus. He pointed out that he had been surveyor for nearly twenty-two years, and as he had to pay his own expenses, including the keeping of a horse and trap, it was impossible for him to live on his present salary of £140.

The matter was considered in committee, and after a long discussion it was decided by a majority of one to grant Mr. Owen a war bonus of £5 a year until six months after the war.

As Mr. Owen re-entered the room (the *Montgomery County Times* reports), a member, Mr. Darlington, exclaimed: "I don't care who knows; I voted against it. I think it is monstrous!"

As the grant represents an addition of slightly under two shillings a week to the surveyor's salary, we imagine there will be few who will disagree with the worthy councillor in his final remark.

Institution of Municipal Engineers.

EIGHTH ANNUAL MEETING IN LONDON.

The eighth annual meeting of the Institution of Municipal Engineers was held on Saturday last in the Council Chamber, Southampton-row, under the chairmanship of the retiring president, Mr. Henry C. Adams. The attendance included Messrs. A. W. Broker (North Witchford), Geo. Rodley (Norfolk County), G. Simcox (South Mimms), J. Randerson (Sevenoaks), T. C. Barralet (Godstone), H. Pickering (Luton), A. J. Elson (Penge), A. N. Hudswell (Woolwich), T. Mundy (Woolwich), and H. C. H. Shenton (Westminster), together with several visitors.

The PRESIDENT remarked that at the present time the difficulty of travelling was so enormous that they must not be surprised at the smallness of the meeting, though it was to be regretted. He had received from Mr. Matthews Jones, past-president, a letter stating that this would be the first annual meeting he had missed, but that he could not attend, as he was ill in bed. Mr. Finch, senior vice-president, was detained in Cumberland, and Mr. Cutler wrote that he had been ordered to rejoin the Royal Engineers. He was called up early in the year, and after three months' strenuous training, which reduced his bulk considerably, he was sent back to his office; but now they had called him up again. There were a number of letters from other members regretting that they could not attend, owing chiefly to illness and the difficulty of travelling.

ANNUAL REPORT OF COUNCIL.

The PRESIDENT then proceeded to read the annual report, extracts from which are appended.

On June 30, 1915, the roll of the institution was 842, consisting of 672 members, 127 associate members, and 43 students. On June 30, 1916, the roll was 827, consisting of 662 members, 125 associate members, and 40 students. During the year twenty-three members, six associate members, and three students were elected, while two associate members were transferred to membership, and three students transferred to associate membership. The losses resulting from death, resignation, erasure by change of appointment, and other causes amount to thirty-five members, eight associate members, and three students.

FINANCES.

The council are again able to report an excess of income over expenditure on the year's working, amounting to £46 18s. 4d., and making an accumulated balance of £486 5s. 1d. Following the practice of last year, £175 has been laid aside as a provision against "irrecoverables." It will be seen that the "subscriptions overdue" item bulks very largely, but it must be remembered that a large proportion of this is in respect to corporate members and students who are on active service, upon whom no claims for subscriptions have been made, although a certain proportion of them have paid with customary regularity. A proportion of these overdue subscriptions will, doubtless, have to be written off at the termination of the war.

MEETINGS.

One general meeting, eleven council meetings, and six district meetings were held during the financial year.

PREMIUM FOR PAPERS.

The President's premium (presented by Mr. Henry C. Adams) for the year 1915-16 for papers read before meetings of the institution has been awarded to Mr. John H. Mole for his paper, "Some Observations on Municipal Housing."

MUTUAL AID AND DEFENCE FUND.

The amount standing to the credit of this fund at the end of the financial year is £116 3s. 2d. One application was made for assistance from the fund, but the council decided that the case was not one which fell within the purpose for which the fund was created.

COLONIAL AND FOREIGN DISTRICT SECRETARIES.

Having regard to the spread of the membership of the institution to all parts of the world, invitations have been extended to the members in the Colonies and abroad to appoint local hon. district secretaries. As a result of this, hon. district secretaries have already been appointed in Canada, and other appointments are under consideration and will shortly be made. The appointment of gentlemen to these positions will, it is felt, result in increased vigilance in the inspection of applications for corporate membership, while the formation of district committees, where possible, must assist materially in the welfare of members of the institution in over-sea countries.

The PRESIDENT moved that the report and balance-sheet be adopted, and in doing so said perhaps he might refer again to the balance-sheet. It would be seen that, compared with previous ones, it showed a very great improvement in the financial position of the institution. They expected this year that the income would show a very great decrease, or rather that the receipts would be considerably below the expenditure, but economies had been effected in every possible way, and although they had lost a good many members by death on active service, they managed to keep the expenditure within the receipts, and had been able to hand over a sum to the accumulated balance, which now stood at the high figure of £486. During the year they had not gone in for any new development—very naturally. The greatest thing they had done was to formulate and publish the regulations for the Mutual Aid Defence Fund. Many discussions were held over the details, and the institution's solicitor was consulted three or four times at different stages, and assisted in putting the regulations into legal phraseology. The fund, he (the president) thought, should be of great value to the members in the future. He might issue a word of warning, and that was that the war was not yet over. A large number of members were away, and when things sorted themselves out again they would probably have to record greater losses than, unfortunately, they had had to record up to the present. Members on active service had not been asked to pay their subscriptions. They thought that was the least they could do. When that was decided upon they thought the war might be over in a few months, and it had gone into the third year now. The amount lost in this way would loom rather a large item, and while in ordinary peace conditions the members would be asked to pay up the arrears, many would not be in a position to do that. Therefore the council would have to face a certain loss, which would be put down to the war; but, looking at the finances broadly, there was no doubt they would recover their position very shortly after the war.

Mr. SIMCOX seconded the adoption of the report and balance-sheet, and the proposition was agreed to.

Mr. RANDERSON mentioned that one of their members, Lieutenant Fry, had been awarded the Military Cross, a fact which he thought would be interesting to the members.

The PRESIDENT said that information was decidedly of interest, and it would be duly noted in the next issue of the *Journal*.

THANKS TO THE RETIRING COUNCIL.

Mr. G. RODWELL (Norfolk County Council) moved a vote of thanks to the retiring council, which was carried.

Mr. J. RANDERSON (Sevenoaks), in seconding, said that, in spite of the considerable distances which members of the council had to travel, and the difficulties under which everybody had suffered, the attendances at the meetings had been good.

THE NEW COUNCIL.

The PRESIDENT stated that, in accordance with the powers vested in his office, he had appointed Mr. Boot and Mr. Shenton scrutineers of the ballot, and had received their report giving the names of the members elected.

The list of the new council is as follows:—

President: Mr. Edward Whitwell, F.I.S.E., M.S.A., engineer and surveyor, Abersychan Urban District Council.

Vice-presidents: Messrs. A. R. Bleazard, borough engineer, Clitheroe; Arthur Bowes, ASSOC.M.INST.C.E., surveyor, Newton-in-Makerfield Urban District Council; H. J. Farmer, borough surveyor, Christchurch; William Finch, county surveyor and bridge

Chester; Councillor Frank A. Pratley, engineer and surveyor, Epsom Rural District Council; H. C. H. Shadbolt, consulting engineer, 28 Victoria-street, S.W.; and William Wallin, consulting municipal engineer, Newport, Mon.

Honorary Treasurer: Mr. Thos. Mundy, deputy borough engineer, Woolwich.

Ordinary Members: Messrs. John Bailey, surveyor, Spalding Urban District Council; C. Owen Baines, town surveyor and engineer, Paignton Urban District Council; Alfred H. Carrell, county road surveyor, Leicestershire County Council; G. Belson Chilvers, surveyor, Oundle Urban District Council; Frank S. Cutler, deputy borough surveyor, Deptford, S.E.; E. Plummer Davies, engineer and surveyor, Tisbury Rural District Council; John Davison, borough surveyor, Morpeth; Frank E. Ennals, surveyor, Billericay Rural District Council; Douglas C. Fidler, engineer and surveyor, Hayes Urban District Council; W. J. Grant, surveyor, Romford Rural District Council; Arthur Harford-Stevens, engineer, Blaby Rural District Council; Ernest W. Hearn, borough engineer and waterworks engineer, Chard; R. W. Jones, county surveyor, Carmarthen (Western); H. W. Marsden, borough surveyor, Richmond, Yorks; John T. Pegge, city surveyor, Durham; Harold Pickering, surveyor, Luton Rural District Council; John T. Shield, deputy borough and water engineer, Blackburn; G. Simcox, engineer and surveyor, South Mimms Rural District Council; G. Symon, surveyor, Blaydon-on-Tyne Urban District Council; John Taylor, sanitary surveyor, Uckfield Rural District Council; W. T. Unwin, engineer and surveyor, March Urban District Council; Arthur D. Barron, acting borough engineer and surveyor, Douglas, Isle of Man; A. J. Elson, deputy engineer and surveyor, Penge Urban District Council; A. P. Horsley, borough engineer and surveyor, Hartlepool; and G. A. Penwill, surveyor, Peterborough Rural District Council.

The following members hold office as members of council:—

Past-presidents: Messrs. Horace Boot, M.I.MECH.E., M.I.E.E., Westminster; W. H. Matthews Jones, city engineer and surveyor, Chester; and Henry C. Adams, M.INST.C.E., M.I.MECH.E., F.R.SAN.I., consulting municipal engineer, 60 Queen Victoria-street, E.C.

Chairmen of District Committees: Messrs. A. W. Booker, surveyor, North Witchford Rural District Council; Walter Louis Carr, engineer and surveyor, Ruislip-Northwood Urban District Council; William Finch, county surveyor and bridgemaster, Cumberland; Frank Latham, M.INST.C.E.I., borough engineer and surveyor, Penzance; Colin H. Macfarlane, assistant superintendent, Glasgow Corporation; Ernest Albert Stickland, ASSOC.M.INST.C.E., borough surveyor, Windsor; and H. J. Weaver, M.INST.C.E.I., consulting engineer, Gloucester.

RETIRING PRESIDENT'S ADDRESS.

The PRESIDENT then said that the new president, Lieutenant Whitwell, had written to him expressing his great regret that he was detained out of the country by service for the Government, and that he could not get back for the meeting. Lieutenant Whitwell had been abroad for some time, and he hoped he would be in England for the new year. He was extremely disappointed at being absent. It was rather an unusual situation, but everything was unusual nowadays, and the president hoped the members would forgive him. He had asked him (Mr. Adams) to fulfil his duties, and also to read the very able address which he had prepared and sent over to England. He might say that he had received from the clerk to the new president's council a letter stating that the council had passed unanimously a resolution expressing their appreciation of the honour done to Mr. Whitwell and through him to the district, by his proposed election as president of the Institution of Municipal Engineers. He (Mr. Adams) did not think Lieutenant Whitwell would need much introduction to them from him. He had had a very long apprenticeship to municipal work and very early in his career was surveyor to the Prescott Urban District Council, being at that time the youngest man holding a chief municipal appointment. His present post at Aberdare he had held for eight years. Although he had passed out a busy week there he had also found time to write many papers for the technical societies and the chief subject he had dealt with of recent years had been housing, on which he was certainly an authority. He read a paper last year the thoughts which created a great deal of discussion because he showed he could house decent homes with a rent suitable for workmen in prosperous times, if not at the present day. It appeared to him (Mr. Adams) that the working man would oust the middle classes out of their houses, and that the State or municipality would have to initiate housing schemes for the middle classes. As showing the experienced man Mr. Whitwell was, he was also an engineering expert, and had patented more than one recent improvement in internal combustion engines. That was to some extent outside the duties of the municipal engineer, and emphasised the saying that the busiest men have most time to spare. A large number of public buildings stood to his credit, and among them were several swimming baths. He mentioned that because swimming was another art in which Mr. Whitwell had attained prominence. He had won outright the Northern Life-saving Challenge Cup, and also the swimming championship of Bristol City, while he was invited to swim in the International swimming races in 1907. It was said that the engineer was a man of many parts, and they certainly had a man of many parts in Mr. Whitwell. He (Mr. Adams) had every confidence that that gentleman would uphold the importance and carry out the duties of the high office he had been called upon to fulfil in the most able manner.

VOTE OF THANKS TO RETIRING PRESIDENT.

Mr. T. BARRALET (Godstone) said it was his pleasing duty to have to propose somewhat unexpectedly a vote of thanks to the retiring president, Mr. Adams. He had had the pleasure of knowing that gentleman as a member of the institution for a considerable period, and it had been to him a source of instruction and satisfaction to admire the manner in which he had carried out the duties of his exalted office. These duties he had carried out with dignity and impartiality at a period when the difficulties of the office were much more onerous than in the times of peace. Mr. Adams was the distinguished son of a distinguished father—whom also he had the pleasure of knowing in years gone by—and as president he had proved an asset to the institution of no little value. Mr. Adams stood exceedingly high in professional life, and he had been a source of considerable *éclat* to the institution, in whose proceedings he had taken a prominent part. He condoled with him in the difficulties of his position, but the record he had made showed that even in war time the Institution of Municipal Engineers had been able to hold its own. He had followed a worthy line of past-presidents, and if the gentlemen who was to follow him approached even the high character that Mr. Adams had given him in the short *résumé* of his career that had just been delivered, he (Mr. Barralet) ventured to think that Mr. Whitwell would have a somewhat difficult *rôle* in filling the chair in a more excellent manner than the gentleman who had filled it during the past year.

Mr. E. J. ELSON (Penge), in seconding the proposition, observed that, owing to stress of work, he had unfortunately not been able to attend many meetings of the council, therefore he was not elected a member of the council last year, but he might say that he had been a member of the council since its formation, and had had many opportunities of judging the value of Mr. Adams' work. Having been fortunate enough to have been elected a member of the council on the present occasion he had much pleasure in seconding a hearty vote of thanks to the retiring president.

Mr. ADAMS, in reply, said his services had been referred to in far too flattering terms. When he accepted office, much against his will, he said he would do what he could for the institution, and this he had done, but all the same he felt that what he had done was really very little, and certainly far short of what he would like to have done. He attended the meetings he could get to in the vicinity of London, and he also attended a meeting at Newcastle—a very large meeting, where he had the pleasure of meeting fifty or sixty of the Northern members. The members were spread all over the country, but there were large numbers congregated in the North and South. Of course, the member in the South could not very conveniently go up North, while the Northern member found a difficulty in going South, therefore it was very pleasant to have the pleasure of meeting so many gentlemen at Newcastle. The Northern members worked hard for the interests of the institution. They held frequent meetings, and altogether they were a very energetic body of men. Of course, they had all had difficulties to contend with during the present year, and it seemed to him that they were all more or less out in their own little boats on a rolling sea. On the top of the wave they caught a glimpse of a friend, but in the trough of the sea they might not catch sight of him for months. It was quite different to old times,

when they used to know what their friends were doing. His time had been fully occupied during the past year. Early in the year he took charge of the engineering department of a local college to relieve a man on military duties. He had also had charge of an engineering shop engaged in war munitions, the whole of the arrangement of which he had to carry out. Of course, he had also to carry on his own work, and his firm had been selected by the War Office to carry out works for them. He had also had the institution work to attend to, and the only explanation of the fact that he had been able to carry it on was that Mr. Wyand, the secretary, had to a great extent helped him. Everything that had required his attention had been prepared by him in such a form that he could see at once what was wanted, and deal promptly with the matter, and that, as they knew, was a very great assistance to a busy man; whereas hours might have been consumed he found everything cut and dried, and as a consequence they were able to transact business in record time. He had to thank Mr. Wyand for his help, and he knew that the members of the committees also appreciated that gentleman's services. He was afraid that, owing to Mr. Whitwell's absence, they would not get rid of him (Mr. Adams) all at once, but as long as he had the ability he should be pleased to do all he could for the interests of the institution.

The members adjourned for lunch, and on reassembling listened to Mr. Edward Whitwell's presidential address—read in his absence by the chairman. The address is reproduced elsewhere in this issue.

The meeting afterwards proceeded to the consideration of a paper* by Mr. G. Belson Chilvers, entitled

A RÉSUMÉ OF PUBLIC HEALTH MATTERS.

The CHAIRMAN (Mr. Henry C. Adams), in proposing a vote of thanks to the author of the paper, dealt first with the question of open windows. He personally believed in moderation in all things. The closed window was bad, and the ever-open window was likely to be almost as bad. If they wanted to have open windows, they must go into the open country, away from the haunts of man, and from the dust of the roads, because he questioned whether it was healthy to have that dust blown into houses and polluting the air they breathed. It was much more dangerous to have a window open and breathe undiluted fog than it was to have it closed. In the modern room there was a constant interchange of air created by the draught of the chimney, the cracks in the windows and the doors, and unless there was a large number of people present and gas burning one could sit in comparative comfort. With regard to the insanitary arrangements known as middens, in a report of a medical officer of health, recently, statistics were given of infectious diseases classified under the headings of houses provided with water-closets, pail-closets, and middens, and the percentage of cases occurring was much greater with pail-closets than with middens. Of course, the percentage in relation to water-closets was very low. Except in small villages the middens were now very much better than formerly.

Mr. T. C. BARRALET (Godstone) remarked that one could not do too much to emphasise the importance of the health of the people. It was of prime necessity to see that the wastage of war was made good, and to ensure that the coming generation would be physically, mentally, and morally of the best, and, inasmuch as one could not have a sound mind in an unsound body, the foundations of the body must be laid in the homes of the people. The efficacy of an Act of Parliament depended on those who administered it. One might have excellent Acts of Parliament, but out of the hands of persons who had sympathy with their objects they were useless. In rural districts the local councils consisted to a large extent of land owners, property owners, and farmers, who had very little sympathy with the objects of the Public Health Acts; consequently, unless an officer was with a type who was prepared to take the risk of running counter to those who employed him, it would be very difficult to bring the standard of health of a district up to the point it should be. The author of the paper appeared to favour the use of disinfecting powders. On that point he would only say where there were noxious odours use them by all means, but when people spread powders around gullies or put them down water-closets they were on the wrong track altogether. It was a relic of the old times, when it was the practice to burn all sorts of abominations to drive away the plague. Such "remedies" would never do away with the necessity of using the best workmanship in the construction of drainage, and so forth. He thought all of them recognised the advantage of having a bath attached to a house. He used to be a very firm advocate of the provision of baths for workmen's cottages, but after observing the use to which in a number of cases they were put, he had come to the conclusion that such bathing facilities as were provided should be more or less of a public nature. His view was that the extra room was of far more use as cubic space than as a bath-room. He thought they could all sympathise and agree with the recommendation that the time had come when local authorities must more seriously consider their duties as regards the provision of houses for the people. If it was worth while to retain a strong and healthy body of labourers on the soil it was worth while to pay for it. Even supposing the amount they obtained in rents was insufficient to meet the interest on a loan for cottages, it was better to pay a ½d. or 1d. rate on a scheme, because the provision of decent accommodation would in many cases render hospitals more or less unnecessary. The best investment for a local authority after the war—because private enterprise in this connection would be practically wiped out, owing to the cost of labour and materials—would be to see that everybody in their district had a decent, proper, and sanitary home.

Mr. H. PICKERING (Luton) stated with regard to middens that when he went to his district first he found that the closets were chiefly of that type, but since then he had persuaded the owners of property to render them impervious and more sanitary. In the 1909 Act, powers were lacking to make tenants of houses have proper regard for cleanliness, and he hoped that in any new Act that was passed that point would be dealt with.

Mr. REGINALD BROWN (Southall-Norwood) contended, as regarded housing, that the whole thing rested upon the proper education of the people. Better housing accommodation was impossible unless they educated the people to use the houses provided for them in the way they should be. His view was that there should not be more than ten houses to the acre in working-class schemes. As regarded baths, he warned them that they would not get anything through the Local Government Board unless they provided baths—either in the sculleries of the smaller houses or in separate rooms in the larger dwellings. It had often occurred to him that the extra cost was the chief thing which prevented a good many people providing this absolute necessity, but he thought some simple, inexpensive arrangement might be devised to get over the difficulty. Housing in rural districts was a much more troublesome matter than in the urban districts. The housing of the rural population throughout Great Britain—and Scotland in particular—was a national scandal. The amount of disease in these districts was appalling, and it would be a revelation to many to know how much of this arose from bad housing accommodation. Either they must give a man a sufficient wage to enable him to pay a reasonable rent, or they would be compelled to bring into force some form of State assistance to help the local authorities who were responsible for the public health. In regard to the disposal of refuse in rural areas, it was for engineers to devise some simple means by which this material could be got rid of in an easy manner. As an example of what could be done in this direction, they had before them the work of the military authorities; it was absolutely surprising what perfect methods of dealing with slop water and excreta could be introduced into rural areas at little or no cost, and to all interested in the provision of these inexpensive systems of disposal of refuse he would recommend a visit to the exhibition at the Duke of York's School at Chelsea, arranged by the London Sanitary Companies.

The vote of thanks was passed.

Mr. CHILVERS, senr., in replying on behalf of his son, said there was, of course, a great deal in what had been said as to open windows and dust. At the same time, unless windows were kept open the air in rooms—particularly small rooms—could not be kept pure. He, personally, did not quite agree with the writer of the paper in regard to the codification of the Public Health Acts; he thought, however, it would be a good thing to have these Acts consolidated into two or three Acts dealing with water, sewerage, and sewage disposal, and so on.

The next paper,* contributed by Mr. George Redfern, was entitled

PRACTICAL ROAD WORK.

Mr. G. SIMCOX (South Mimms), in proposing a vote of thanks to the author, inquired how the spraying

* See page 45.

* See page 43.

the roads was done, and whether there was any advantage in allowing the tar to boil all day in the sun before gritting. Mr. Rodley favoured gravel for gritting, but it seemed to him that sharp sand was the most serviceable material, and particularly on hilly portions of roads. In such situations it was his practice to leave it along the sides of the roads with a notice inviting carmen to sprinkle it themselves. The result was that the council's workmen were not required to do the work.

Mr. J. RANDERSON (Sevenoaks), dealing with the author's advocacy of the use of 2-in. stone, pointed out that in these days material of that size could not always be obtained. His experience was that they could more easily get a smaller material. He had recently used much of this smaller material, which he had found, after tar-painting, made an excellent road. He did not, personally, see the necessity for keeping a road closed for tar-painting. Was there any better wear in Mr. Rodley's case?

Mr. H. PICKERING (Luton), referring to dry rolling, remarked that the practice was to do too little of this in many rural districts, and to put on the stone too early. Generally it was the first six months that determined the life of a road. In many rural districts surveyors had to deal with roads with poor surfaces, over which passed fast and often heavy traffic, and they were expected to keep down the expense. The cost of putting in good foundations was prohibitive. It was his own practice to put down a layer of 3-in. stone, which he found most effective, on soft roads it made a good foundation and a fairly good surface. Two or three years afterwards it was coated, and he obtained a good road. The practice in regard to road drainage varied in different parts of the country. In the far North it was always the practice for the roadmen to clear out the ditches at the sides of the highways. He had found that was often left to the farmers and others, but he thought it would pay the highway authority to take the work in hand and do it effectively. It paid to keep the water off the roads.

Mr. REGINALD BROWN (Southall-Norwood) mentioned, in regard to the subject of footpath flagging, that the usual crossfall for artificial stone in the South of England was ¼ in.

Mr. T. MUNDY (Woolwich) stated that he had frequently laid artificial stone with a crossfall of ½ in. with quite satisfactory results. With natural York stone he had used a crossfall of ¼ in. That, also, was satisfactory, so that he did not think it was always advisable to have too great a crossfall, but just sufficient to throw the water into the road channel. In any case, it did not make for comfort. As regarded the bedding of flags, he had a preference for solid bedding, which made a far better job. It was preferable, of course, in gritting operations, to use a machine, but the material one used must not be of too loamy a nature, otherwise the machine was apt to clog.

Mr. RODLEY, replying, said his view was that the tarpainting of roads in outside districts and county roads away from villages should be done by machine. In towns the work should be done in half-widths, but in the case of single-track roads they had no alternative but to deal with the whole width in one operation. For gritting he used gravel at 3s. 6d. a load—good, clean gravel. He found no difficulty at all in obtaining 2-in. granite. His experience had taught him that when he wanted 2½-in. Leicestershire stone he must order 2-in., but that when ordering from overseas he must order what he wanted. Gritting in large towns should be done by machine. With regard to the cleaning of ditches and watercourses, in his district they made a practice of issuing to farmers notices requiring these to be cleaned out where necessary.

The third and last paper* was contributed by Mr. Horace Boot, and dealt with the

USES OF ELECTRICITY IN MUNICIPAL ENGINEERING.

THE CHAIRMAN (Mr. Henry C. Adams), in moving a vote of thanks to Mr. Boot, observed that the object of the paper was to draw attention to the importance of a knowledge of electricity among municipal engineers. He found himself, after serving his articles, that such a knowledge was essential to an engineer, and it was an absolute necessity in these days. Mr. Boot had given a fairly comprehensive list of things to which electricity might be applied. One was sewage pumping. In small schemes the cost of labour had always been a great trouble, but he had got over

* See page 26

the difficulty in recent works with which he had been concerned by adopting automatic electric pumping machinery. He knew it was tried a good many years ago and proved a failure, but the apparatus that was obtainable to-day was infinitely superior to that sold ten or twelve years ago. In the matter of electric tramways, the permanent way came under the borough surveyor, but the electrical equipment was, of course, a specialised part of the work that he would advise no one to dabble in unless they were expert electrical engineers. There was no doubt that the installation of electric generating stations by municipal authorities and the distribution of electricity for power purposes would be of very great benefit in many districts, and would, with proper management, prove remunerative undertakings.

Mr. H. C. H. SHENTON (Westminster), seconding, said he had been impressed for some time past with the importance of making use of electrical machinery for sewage pumping. He could say from experience that sewage could be pumped very satisfactorily in either large or small quantities by centrifugal pumps run by a motor. It seemed to him that the fact that a very small pump would lift sewage quite as efficiently as a large one was not properly grasped. It was extraordinary when it was possible to use a small automatic electric pump that ejectors, with the necessary air compressing stations, and so forth, should be put down.

Mr. REGINALD BROWN (Southall-Norwood) said Mr. Boot was to be commended on a highly instructive paper. The subject was one which must come to the front, especially in those places where there was an electricity undertaking. He agreed as to sewage pumping. He could not understand why it should be necessary to construct large storage tank accommodation and then put in immense centrifugal pumps to lift the sewage to another part of the works for treatment, instead of lifting the sewage up gradually throughout the day. Electric vehicles for municipal work had a very great future, but it remained yet to be seen whether the petrol was better than the electric machine. But he thought the electric vehicle had shown itself to be a very useful machine indeed. He saw no reference in the paper to the treatment of sewage by electricity. That might be considered by some to have been an absolute failure, and it had been in a great many cases, but it did not follow that methods would not be brought into use by which the system would be a success, both in the point of cost and efficiency. He believed himself that it was possible to use electricity for this particular purpose.

The vote of thanks was passed, and the proceedings then terminated.

Flash-lamps Without Batteries.—A practicable flash-lamp without a battery—either primary or secondary—sounds almost too good to be true, yet, according to *L'Industrie Electrique*, the feat has been accomplished in Germany by utilising a tiny magneto-generator driven by a spring and clockwork. The mechanism is provided with an escapement which ensures constant speed of revolution for the generator armature, and hence constant voltage. Nothing (the *Electrical Review* observes in noting this interesting innovation) is said about the initial cost of the apparatus, which must be much greater than that of the battery lamp; but by manufacturing in great quantities it should be possible to bring it down to reasonable limits.

Standardising Scottish Municipal Wages.—Representatives of the burghs of Airdrie, Coatbridge, Hamilton, Motherwell, and Wishaw have met in conference for the purpose of considering the wages paid and hours of duty, and in the outdoor departments of the respective town councils with the view of securing greater uniformity in dealing with applications for increase of wages or bonus. Generally (says the *Glasgow Herald*), the conference resolved that the hours of labour, the remuneration per week, the overtime and Sunday pay, the holidays per annum, and the sick pay be standardised. In the matter of increase of wages, the conference recommend a uniform wage in the streets and cleansing departments, the figures being equal to the highest at present being paid in any of the burghs. Provision was made for a Standing Committee being appointed, to whom would be submitted applications for increases of wages, and who would decide whether any question so affected the common interests of the burghs as to call for a joint conference being held.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars have reached us during the present week. Other reports will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Barnsley T.C.—The borough surveyor, Mr. J. H. Taylor, in his annual report, states that only seven dwelling-houses were erected in the town last year, and that fewer cottages were erected than in any of the preceding twenty-five years. He estimates that to make up for the decreased number of cottages 500 to 600 ought to be provided.

Exeter T.C.—Plans of a temporary smallpox hospital which the borough surveyor, Mr. T. Moulding, has prepared, have been referred back to the Sanitary Committee to provide a smaller scheme. Mr. Moulding's plans provided for a six-bed block, an administrative block, laundry, mortuary, disinfector, drainage, fencing, road making, and water supply, at an estimated cost of £3,729.

Manchester T.C. — The Parks Committee have formally sanctioned a scheme for erecting workshops for the benefit of the convalescent soldiers in Heaton Park. The materials have already been obtained by the military authorities, and the work of erection will be proceeded with immediately by the soldiers themselves on a suitable site in the Hall camp. The intention is to teach the soldiers various trades during the period of convalescence.

HOUSING AND TOWN PLANNING.

Aberdare U.D.C.—Consideration is being given to a housing scheme, to take effect after the war.

Chesterfield T.C.—The medical officer of health, Dr. R. Fraser, having reported that at least 200 houses should be erected by the corporation, the Housing Committee have been authorised to go into the matter.

Gelligaer U.D.C.—It is proposed after the war to build working-class houses at Gilfach, Bargoed.

Glasgow T.C.—The medical officer of health, the master of works, the sanitary inspector, and the manager of the city improvements department have received instructions to send to the town clerk, Sir John Lindsay, all the reports, plans, and other information in their possession referring to the question of housing and general town improvement, with a view to a synopsis of the reports being prepared for the Special Committee on Housing and General Town Improvement.

Nuneaton T.C.—The Local Government Board have asked the council to submit to them their proposals with respect to the housing scheme, with a view to obtaining sanction to a loan as soon as circumstances permit.

West Hartlepool T.C. — The Local Government Board have, under the Housing and Town Planning Act, sanctioned the corporation's control over 3,778 acres in various parts of the borough. The original application referred to 5,332 acres.

MOTOR TRANSPORT.

Cheltenham T.C.—It has been agreed to purchase an electric vehicle for £1,050 for the collection of house refuse. It was stated that, at a charge of 9d. per mile for electricity, the new vehicle would effect a saving of £10 per annum on the present charges.

Glasgow T.C.—The superintendent of cleansing reports that the first of the two Edison electric vehicles for refuse collection was delivered on December 4th, and is giving entire satisfaction.

ROADS AND MATERIALS.

Chapel-en-le-Frith R.D.C.—The council have made arrangements to release the surveyor of highways, Mr. E. J. Hunter, for road service in France, and have agreed to pay him the difference between his salary and his Army pay. Mr. J. Lomas, road foreman, has been appointed Mr. Hunter's deputy during his absence.

Colchester T.C.—Provision is to be made in the next estimate for the use of tarred clinker on certain roads.

Derbyshire C.C.—A proposal of the county surveyor to establish a central depot and tar-macadam mixing plant, at an estimated cost of £7,000, was before the council on Wednesday. Authority was given for the scheme to be proceeded with.

Dublin T.C.—Schemes for the widening of Chancery-street and Lower Liffey-street have been prepared for submission to the city council.

Ellesmere Port U.D.C.—The surveyor, Mr. J. M. Hudson, has been instructed to prepare a specification of the work required to complete the North-road.

Keynsham R.D.C.—An intimation has been received from the Somerset County Council of their intention to take over the whole of the main road tarring and deal with it direct from the county surveyor's office by the county contractors, the work to be paid for direct by the county council. The surveyor, Mr. J. Johnson, said the work of tarring would be extended, and he believed it would tend towards economy in road maintenance. The rural council would have some control as to how much was done, as they could make recommendations to the county council.

Penrith R.D.C.—The Highways Committee reported that they had considered a letter from the county council with reference to the Emergency Provisions Act as to prohibiting the use of certain roads by motor omnibuses, &c. It was decided that the county council be informed that this council does not desire to prohibit the use of any district roads under the Act, which is only a temporary measure. Mr. Bolton asked what was the object of closing roads to omnibus traffic? The clerk said he supposed it was really meant for localities where there was an enormous traffic for Government purposes.

Perthshire C.C.—The Western District Committee have decided again to approach the Glasgow Corporation on the subject of the Trossachs road. Their proposal is that the corporation should construct a light railway alongside the road, and that the district committee should bottom the road—which has an average width of 11 ft.—and make it suitable for motor traffic.

Sheffield T.C.—The city surveyor, Mr. W. J. Hadfield, has been authorised to negotiate with the Midland Railway Company for the construction of islands or refuges for the better protection of foot traffic at the station approach.

SEWERAGE AND SEWAGE DISPOSAL.

Newport (Mon.) T.C.—The Mannesmann Tube Company have written to the corporation stating that about 300 men would shortly be employed at their Newport works, in addition to 120 by the United Tube Corporation, and suggesting that the sanitary arrangements be complied with. The Health Committee recommend that a deputation should wait on the company to urge that the construction of the proposed sewer, at a cost of £36,000, should be deferred for the time being, and that a temporary arrangement should be made to deal with the sewage.

Wantage R.D.C.—The Local Government Board have written, with reference to the council's application for a loan to carry out a drainage scheme at Letcombe Regis, that the parish was in greater need of a water supply, and suggesting that the sewerage scheme should be deferred until a water supply had been provided.

WATER, GAS, AND ELECTRICITY.

Burton U.D.C.—The council have accepted the tender of Messrs. R. & J. Dempster, Manchester, for the installation of a benzol plant at the gasworks. The tender of Messrs. Tangyes, for pumps, and the tender of the Cradley Boiler Company, for two oil storage tanks, are also recommended for acceptance.

Derby T.C.—The Electricity Committee propose to effect main extensions at an estimated cost of £250.—The council have approved the recommendation of the Electricity Committee for the extension of the generating station including the installation of new machinery.

Eastbourne T.C.—Owing to official lighting restrictions, a deficiency of £2,100 in the municipal elec

[illegible] account for the past half-year is reported. There is however a substantial reserve, accumulated [illegible]

Kirkcaldy T.C.—With reference to a report of the [illegible] with respect to the present [illegible] and the applications for additional [illegible] Mr. Small, who was consulted in the [illegible] to the town's council, states that it would not be [illegible] to abandon the present generating [illegible] on account of the greater expenditure [illegible] a new station would entail. He considers the only [illegible] to a bulk supply is the re-[illegible] of the existing station, and he submits a programme of extensions spread over ten years, which he thinks would meet the requirements in Kirkcaldy for at least that period. He states that Mr. Balfour, the managing director of the Fife Power Company, would be prepared to recommend his company to acquire the existing undertaking at the amount of the present capital indebtedness, which is approximately £38,000, his company to supply all current power in bulk for the present and future requirements of the corporation, the corporation paying a certain sum per annum towards the expenditure, and to retain control of the distribution of electricity within the burgh. Failing the adoption of that suggestion, he thinks the next best alternative would be to extend the present works, at an expenditure of £61,300, spread over a period of ten years.

Manchester T.C.—The Electricity Committee recommend the city council to apply to the Local Government Board for borrowing powers to the extent of £30,000. The last sanction for a similar amount, the committee state, is fully earmarked for sub-stations now being equipped, and before any further necessary contracts can be placed it is imperative that further powers should be obtained.

Newport (Mon.) T.C.—The Waterworks Committee have inspected a site in the Caerfanell Valley, near Talybont, with a view of constructing a reservoir there. The landowners are to be asked for permission to make trial holes at certain given points.

Plymouth T.C.—The Water Committee have given a sub-committee full authority to make arrangements with the proper Government department for the employment of German prisoners of war on the construction of the new pipe line.

Port Glasgow T.C.—The council have presented a Provisional Order to the House of Commons for the purpose of augmenting the existing water supply. It is proposed to raise the embankment of Auchendores reservoir 6 ft. and to divert the waters of Cunston Burn into this reservoir, giving an increased supply equal to six weeks for the whole community.

Walsall T.C.—It was stated in the report of the Electricity Committee that, owing to the Ministry of Munitions having commandeered certain plant at the [illegible] works, it had been decided temporarily to increase the charges for current by 20 per cent in order partially to meet the prospective deficit on the undertaking.

MISCELLANEOUS.

Halifax T.C.—The nett profit of the tramway undertaking last year was £9,965 as against £16,211 in the previous year.

Sheffield T.C.—The city surveyor, Mr. W. J. Hadfield, reporting on the state of his staff as affected by military service, states that since July, 1914, the number of surveyors has been reduced from 1,150 to 416. He recently appeared before the local tribunal in respect of two clerks and twenty-four workmen. The men were given one month's further exemption, [illegible] three months' exemption and eight [illegible] exemption. Three others had already obtained conditional exemption, and these together with fifty-one already enrolled were the whole of the staff of military age. The average age of those now employed is about 40½ years. A suggestion had been made that women might be employed and more [illegible] for [illegible] work. The shortage however, was among the skilled labourers. There are [illegible] positions open for sweeping and other light work. If there could be a scarcity in this [illegible] it would be advisable to introduce female labour. It was reported to the Highway Committee that in view of the [illegible] of the work now being carried out the [illegible] would not be raised at the present time to provide the [illegible] for road work in France.

PERSONAL.

Mr. F. Dowling has been appointed temporary surveyor to the Clare Urban District Council.

Mr. James Donnelly has been appointed surveyor to the Enniskillen Urban District Council.

Mr. H. Vickery, surveyor to the Totnes Rural District Council, has been appointed surveyor to the Malling (Kent) Rural District Council.

Mr. J. R. Wright, of Redcar, has been appointed assistant surveyor to the Blackwell Rural District Council for the duration of the war, at a salary of £130 a year.

Mr. H. A. Endsor, formerly district surveyor at Keynsham, has been appointed surveyor of the Long Ashton main roads by the Somerset County Council, at a salary of £200 a year and £30 travelling expenses.

Mr. H. C. E. Rayner, borough surveyor of South Molton, has joined the Forces, and the town council have decided to pay him the difference between his Army pay and separation allowance and the amount he received as salary.

Mr. G. Plummer, surveyor to the Hayward's Heath Urban District Council, has been voted £40 in respect of extra work done by him in the preparation of surveys, plans, specifications and supervision of the private street works in Western-road.

Mr. Leslie Roseveare, M.INST.C.E., borough engineer of South Shields, has taken up duty as Corps Road Officer, with the rank of Captain in the Royal Engineers, in the recently formed battalions for service in France.

Mr. W. Davey, surveyor to the Brandon Rural District Council, has joined the Army for road work in France, and the council have agreed to employ Mrs. Davey to keep the books in his absence, allowing her £28 per annum for this work. Mr. Froud will carry out Mr. Davey's professional work.

Mr. S. W. A. Carter, city surveyor of Gloucester, has accepted service with the Road Corps in France, with rank of Captain in the Royal Engineers, and Mr. R. Read, consulting engineer to the city council (the former city surveyor), has been appointed temporarily city surveyor and waterworks engineer, with an extra allowance at the rate of £100 a year, with the necessary clerical assistance.

Mr. F. J. Hurley, surveyor and sanitary inspector to the Crickhowell Rural District Council, has been appointed deputy road surveyor to the Breconshire County Council, in the place of Mr. W. L. Harpur, who has accepted a commission as Captain in the Royal Engineers for road service in France. Mr. Wilfred Watkins, Llangynida, has been appointed deputy surveyor to the Crickhowell Rural District Council.

Mr. George Rodley, district surveyor to the Norfolk County Council, who was one of the readers of papers at last Saturday's annual meeting of the Institution of Municipal Engineers, commenced his career in the Sheffield highways and sewerage department. At the age of twenty-five he was general foreman to the Ripley, Derbyshire, Urban District Council, and three years afterwards took up a similar position under the corporation of Leamington. Later he became district, and subsequently chief, foreman under the borough engineer of Birkenhead. His next position was that of clerk of works on Road Board improvement works, under the West Suffolk County Council. He was appointed to his present post in June, 1914. It may be mentioned that his father has for about twenty-five years filled the position of highways superintendent under the Sheffield Corporation.

MILITARY CROSS.

Lieutenant Wallis Coales, R.E., son of Mr. Herbert G. Coales, engineer and surveyor to the Market Harborough Urban District Council, has been awarded the Military Cross.

Government Grant for Dublin Rebuilding.—The Dublin Castle authorities have received £100,000 as an instalment of the Government's ex-gratia grant for the rebuilding of house property destroyed in Dublin during the rebellion. In the absence of information as to the amount of compensation, building work has not yet been commenced in the principal thoroughfares. Two or three houses have been rebuilt in the side streets, but while the number of wooden shops in the main streets is being constantly increased there is no sign of the erection of any permanent structure.

A Résumé of Public Health Matters.*

By G. BELSON CHILVERS, Engineer and Surveyor, Oundle Urban District Council.

Health is probably the greatest and the most sought-for thing in our lives. I feel that the healthy nation is the most progressive. Without health nations and men must deteriorate. Happiness and comfort are bound up in it, and therefore if we desire to progress and live comfortably and happily we must continually seek after it and do our part in all respects to secure it for ourselves and others.

We often hear it said that cleanliness is next to godliness, and I would in all sincerity say it is akin in many cases. Godliness goes with cleanliness. Insanitary and unhealthy conditions assist the devil and all his works, and many people leave the squalor of their homes to seek what they call pleasure and enjoyment in the haunts of vice and sin. Social reforms in health and sanitation, I believe, assist to make people better morally and spiritually, although these reforms cannot of themselves give the true spirit and make a devil a saint. Insanitary and unhealthy conditions impair long life, lower vitality, and render people living in them prone to many of the diseases and ailments of mankind.

Doctors' medicine and faith may go a long way in curing us of ill-health, but we need to remember the old saying, "God helps those that help themselves," and the securing of healthy conditions is one of the foremost helps we can render. It is surprising how ignorant or how negligent many people are of the ordinary laws governing hygiene. Soap and water, freedom from dust and dirt are rarely sought after, and would appear to be at a great premium.

In my inspection of various houses I have seen many cases where people seem to glory in their dirt, from the living-room to the bedroom. Fresh air and sunlight only accidentally gain access to their dwellings. It is very certain that none need live in filth or be dirty in their person.

Dust, dirt and filth are the breeding-places for flies, fleas, microbes, disease germs, &c. Insects are disease spreaders; they travel from filth to food and deposit infectious matter thereon.

Ventilation, with a boundless supply of fresh air and sunlight, are wonderful cures for many dread diseases, purifying and cleansing the air we breathe; yet we find windows closed and blinds drawn to shut out the pure air and sunlight. The sun must not shed its rays upon our furniture, carpets, &c., for fear of making them fade! We had far better only have things which do not fade than shut out the glorious sun's rays. What is the use of by-laws compelling builders to provide windows of at least one-tenth the floor area, half of which must be made to open, if we defeat the object for which they were made?

Many people, too, have an unnecessary amount of hangings and draperies, ornaments, knick-knacks, and other dust harbourers about their houses; rooms have too many ornamental mouldings, crooks, crannies, and corners about them; and all these harbour dirt and dust, and time will not allow them to be cleaned except on quite rare occasions, which may be annually at the time called "spring cleaning." Carpets may be very well in their way, and make a room more cosy, but it is certain they are not so cleanly as linoleum or stained and polished floors, with a few rugs or mats placed where required, and easily taken up and freed from dust.

Wallpapers often leave much to be desired, more especially when a new paper is put directly over an old one. I have found as many as six papers, each on top of the other—a most insanitary arrangement, as decomposition must take place. Why can we not get ourselves used to distempered or painted walls? They can be made to look very nice by a proper arrangement of colours and forming dado and frieze, and are certainly more sanitary and healthy.

We are all agreed that dust, dirt, garbage, and other rubbish should be kept as far as possible from the dwelling-house, yet it is surprising how often we find the rubbish receptacle as close as possible to the doors and windows of the house. It is to be regretted that in so many towns these receptacles are open wood boxes, pails or old baths. We find a grand selection, but it is a difficult matter to secure the provision of a proper bin, and the official even does not obtain the support he should. If only we could press upon people the necessity to secure for themselves a proper galvanised bin with cover, which appears to me to be the most satisfactory if properly used! We have recently had brought to our notice a contrivance which, although ingenious, leaves, I think, much to be desired. We have all been to the open rubbish box, and know that it harbours flies, and gives off a most unpleasant odour; this would not be experienced with a proper bin. What is the use of having fly papers and catchers in the house if we surround ourselves with breeding-grounds?

The drainage and sanitary arrangements to our houses need constant attention, and should be periodically cleansed and flushed. A liberal use of disinfecting powder or fluid may be allowed, but it is always better to give our attention firstly to the cause of offensive emanations, and then we may find that no disinfecting agent is needed. Especial care needs to be taken in connection with those antiquated and most insanitary arrangements called middens, although these are gradually disappearing, and the sooner they are abolished the better.

In the majority of towns there are now efficient drainage and sewerage systems, and proper means of disposal. There are yet still towns without an efficient system. Many large country villages also have no system, and the conditions are most unsatisfactory. These places do not bother about it; they seem content to go on in their own "sweet way." They will not hear of any scheme. Those responsible look upon themselves as economists; yet their economy is but false, and their interest a "pocket one," the welfare and well-being of the people being the last consideration. A pure and efficient water supply is another essential for all places, yet we have many small towns and villages without it. Water is taken from defective and impure sources, while wells are close to cesspools and drainage from cattle yards, and other fouled surfaces have access to them. This is often due to the faulty construction of the well or cesspool. What appears to have happened is this—two holes were dug, and lined with dry-laid bricks, one being called the well and the other the cesspool. Can we wonder at disease being rampant? We also find the water supply taken from an open pond, full of mud and growth, and often a drain pipe discharging its contents into it. Many small towns and villages view with great disfavour and are up in arms if an efficient system of sewerage, sewage disposal, or water supply is suggested. They will tell you that their arrangements have sufficed for the past and no ill results have occurred; the inhabitants, they say, live as long as they like, and yet facts prove otherwise. A case like this occurred during the past few weeks in the district adjoining mine. In places where proper systems have been installed the death-rate is lowered, infantile mortality reduced, infectious disease eradicated, or nearly so, and the general health bettered.

Slum dwellings and houses packed together in any corner, without sufficient air space round about them, are another factor conducive to ill-health, although such arrangements are now practically impossible, and those in existence will undoubtedly be done away with before many years.

It is to be regretted that so many of the smaller houses have no proper facility or cupboard for the storing of food. A dry and well ventilated pantry should be a *sine qua non* if food is to be kept in a wholesome condition.

A bath and bath-room should also be provided; even in the case of very small property, why could not a small building be erected for the use of about six houses? What upon this matter. I should like to ask why some water authorities, who are also the sanitary authority, make an extra charge for water used for a bath? It is what I call taxing cleanliness, and should not be.

It is also necessary that the places where people are employed should be well ventilated, lighted and clean, and that only a limited number of persons should work in a certain space.

The Governments of the past and present have been alive to the importance of these matters, and have pass-

* Paper read at the annual meeting of the Institution of Municipal Engineers last Saturday.

us. Two Acts and have compelled, and are compelling sanitary authorities to carry out works, and to raise loans for the works, to make the country healthier to live in and to prevent the spread of disease.

The most important Act is the Public Health Act of 1875 amended in 1890 and 1907, which deals with matters of sewerage, sewage disposal, drainage and sanitation, water supply, street and house scavenging, nuisances, offensive trades, infectious diseases, food inspection, construction of new buildings, slaughter-houses, common lodging-houses, and like matters. We have also other Acts relating to the milk supply, embodying regulations as to lighting, ventilation, and cleanliness of cowsheds, dairies and milk-shops, also as to infectious disease among animals, canal boats, caravan dwellings, factories and workshops. We have also other Acts amending and extending these Acts, and new ones entirely dealing with important health matters, and I believe that since 1875 over sixty Acts have been passed dealing with matters allied to this subject. The Local Government Board have great power bestowed upon them to wake up defaulting authorities to their responsibilities, compelling them to carry out works.

The most important Act of recent years is without doubt the Housing and Town Planning Act of 1909, which makes it compulsory for all sanitary authorities to cause to be made from time to time a systematic inspection of all dwelling-houses in their district and to tabulate the conditions found as to sanitation, general repair, lighting and ventilation of the premises, and as to the number of inhabitants of each house. Owners may be compelled to remedy any defects, and in cases of general dilapidation to close the house for human habitation, and if necessary to demolish the premises.

This is a most important Act, and will undoubtedly improve the housing conditions of the poorer people. The Local Government Board are stringently enforcing its carrying out, and require annually a full report as to work done. It is to be regretted that owners of property should so often need forcing to do necessary work. Local authorities have also power bestowed upon them to erect in their district houses for the working classes, and the Local Government Board can compel authorities to carry out schemes where there is a scarcity of houses.

Another important matter which can be carried out under this Act is the preparation of town planning schemes, showing how the district is to be laid out in the future, the line or course of any new streets, the laying out of estates, sites for open spaces, recreation grounds, public buildings, &c., and the number of houses that may be erected on a certain area.

I feel that it would be a good thing if all districts, especially those urban in character, large and small, prepared a scheme. In many towns we find *cul-de-sac*, necessitating the taking of circuitous routes, or the travelling over ground twice when once would suffice. These streets are likely to remain as such, owing to the action of the owner of the land adjoining.

I mentioned previously the number of Acts there are in force dealing with public health and kindred matters. It is said that these were all embodied in one Act of Parliament. The present crisis is not an opportune time to go into the matter, although I feel that as much consideration should be given to it and municipal engineers and sanitary surveyors given a chance to air their views. Amendments and additions are needed still: there are many anomalies, and some sections are certainly not clear. Possibly a commission might be appointed, composed of men, chiefly surveyors, medical officers and others, who would receive evidence. Probably we shall in the future have a Ministry of Public Health, or some other department, whose duty it will be to deal with this subject.

We each have our individual responsibilities in this great matter, and can make our towns or our country villages better to live in from a health point of view. Let us pray that God will bless us for our foresight and consideration, and we shall become a healthier, stronger and longer lived nation.

Coast Sand Dunes (By Gerald O. Case, St. Bride's Press, Limited, 24 Bride-lane, E.C., price 5s.).—Mr. Case has done a valuable work in the writing of this book.—*Southport Guardian.*

TOWN-PLANNING INSTITUTE.

A NEW TOWN PLAN FOR THE CITY OF DUBLIN.

Mr. J. W. Cockrill, M.INST.C.E., presided on Friday last at a meeting of the Town Planning Institute, held at the rooms of the Institution of Municipal and County Engineers, 92 Victoria-street, S.W., when papers were submitted by Prof. P. Abercrombie, A.R.I.B.A., and Mr. S. A. Kelly, F.S.I., on the town plan for Dublin, prepared by the authors which was awarded the prize offered by the Marquis of Aberdeen to the municipality of Dublin.

Prof. Abercrombie said the plan was based upon three main factors—sociological, geographical, and historical. Other considerations entered naturally into the course of its elaboration, but these three were the determining factors which shaped its physical conformation. The sociological basis took the form of an imperative requirement—the need for some scheme upon which to provide new houses for 60,000 persons who were living in sub-human conditions. The two other factors related to transportation. The geological factor was the conformation of the valley of the Liffey, by which it was evident that a tunnel could be made without excessive cost along the valley to connect Amiens Station with Kingsbridge Station, and a cross connection could be devised to connect Westland Row Station with Amiens Station, or with the east and west tunnel, and join Kingstown with Kerry and the North. The geological factor, then, suggested the feasibility of complete railway unification and a central Union Station.

The historical factor referred to the road system, particularly on the north bank, where the traffic aims of the country roads, making for the one bridge across the Liffey to the walled mediæval town on the south, were sufficiently apparent. A restoration of this natural web provided an objective, at present thwarted, for the radial roads, with a crossing, not by the original bridge, as the block of the Four Courts intervened, but immediately to the east, duplicating Richmond Bridge. On the site of the old Ormond Market, then, was the new traffic centre of the city, the road and railway centre coinciding, as they should wherever this was possible. The south bank was less simple to treat, but by the creation of a subsidiary road centre the difficulty had been overcome, and by this arrangement Sackville-street was freed of the incubus of the tram nexus.

The silting up of a large part of Dublin Bay had suggested (*a*) the method upon which dock extension should proceed; (*b*) two areas for reclamation, the northern industrial and the southern residential; and (*c*) the utilisation of the North Bull bank, already naturally reclaimed, for a great sea-fronting park. At the mouth of the harbour a colossal power station was proposed.

Dublin presented a most attractive ground for the town planner to work upon—its possession of a series of public buildings of great nobility, whose setting was frequently marred by the juxtaposition of deepest squalor or brutal utilitarianism; its famous Sackville-street, now about to be rebuilt; its fine series of radial roads; its individual wide streets, tenement ridden and isolated from full city life; its north and south circular roads; Phœnix Park, whose wedge-shape the most meticulous landscape architect could not improve; and the Liffey, a stream capable of the most beautiful treatment. These and many other fine features were waiting to be worked into a consistent and coherent plan.

Prof. Abercrombie proceeded to point out how some of the very misfortunes of Dublin in the past now gave it opportunities in the way of town planning denied to other towns. There was a dense population in the centre, but in opening up outside areas there was not a vast accretion of by-law suburbs to face. There were also a great number of derelict sites about the centre area, which presented an unrivalled opportunity for central improvements. The proposals by his partners and himself had been plotted in three periods, according to their degree of urgency, and modifications could be introduced as the work proceeded, without destroying the general conception. It also illustrated how the main objects of the plan could be put into operation at an early stage, so that the commercial improvement might ensue, while their final completion would come about naturally as prosperity rose high. If the method of a periodic development was clearly grasped there was no need to be daunted by the magnitude of the proposals. Enormous results could be obtained if

only everything that was done, however small, was part of a thought-out organic scheme.

A paper had also been prepared by Mr. Sydney A. Kelly, who collaborated with Prof. Abercrombie in preparing the scheme. The paper dealt more in detail with the proposals of the authors, and these were explained by Prof. Abercrombie with the aid of a fine series of lantern slides.

SURVEYORS AND COTTAGE DESIGN.

To the Editor of THE SURVEYOR.

SIR,—In the lecture by Prof. S. D. Adshead, which is reported in your issue of Friday last, there appears what is, to my mind, a most unjust attack and slander upon the general body of surveyors to local authorities.

The worthy Professor says in plain terms that we should not be trusted with, and are incapable of, preparing plans of houses under town planning schemes. If this is so, then heaven help us; at any rate, if some of the houses one has seen at various garden cities are to be taken as models, it will be difficult to realise what we are aiming at.

Among many of the above models we may particularly note the following: Pantry or larder stuck under the stairs, or perhaps in some corner, and about 4 ft. square; then, more often than not, the water-closet, or pan privy, immediately adjacent to larder, and separated therefrom by a 4½-in. wall. Then comes the living-room or kitchen, still in the happy company of the above water-closet or pan—and the same 4½-in. wall. Then there is usually a kitchen or living-room of about 10 ft. by 9 ft., containing about six doors, sink, washing copper, &c.—all this to make a family comfortable.

On one occasion I had the privilege of preparing a housing scheme of about fifty cottages, and I took the plans to an eminent architect at the head of a certain Government Department. All went well until I was asked: "What provision do you suggest for the removal of the smell from cooking of meals?—the smells of this should not pervade the bedrooms." I suggested that the smell of cooking would be very welcome in many artisans' homes. But it was insisted that something must be done, and the arrangement accepted was that the usual trap or door giving access to the roof should be of perforated zinc, and an additional flue provided in the upper part of the chimneys, with entrance to same, by an air-brick, the said flue, air-brick and perforated zinc together being intended to carry off the fragrant breakfast fumes. The scheme then went through, the houses were built, but no flue, no zinc. No; we like to smell the cooking.

When will architects and housing companies produce a sound, comfortable cottage for the working classes? Villadom can look after itself; it is cheap, good cottages that are wanted, not decorated summer shelters at 10s. or 12s. per week.—Yours, &c.,

LOCAL SURVEYOR.

January 9, 1917.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

MAIN ROAD DISTRICT SURVEYOR.—January 13th.—Derbyshire County Council. £230 per annum.—Mr. J. W. Horton, county surveyor, County Offices, Derby.

TEMPORARY BOROUGH SURVEYOR.—January 13th.—Corporation of Middleton.—Mr. J. P. Walmsley, town clerk, Town Hall, Middleton, Lancs.

SURVEYOR AND INSPECTOR.—January 15th.—Dorking Urban District Council. £250 per annum.—Mr. W. J. Hodges, clerk, 64 South-street, Dorking.

TEMPORARY SURVEYOR'S ASSISTANT.—January 23rd.—Corporation of Aylesbury.—Mr. W. Harold Taylor, borough engineer and surveyor, Town Hall, Aylesbury.

TEMPORARY ASSISTANT.—Tenby Town Council. 30s. per week.—Mr. B. Morley, borough surveyor, Tenby.

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

Buildings.

EAST LANCING.—January 16th.—For the erection of a timber barrier and a timber wave screen on the sea front, for the commissioners.—Mr. Kenneth Loader, deputy clerk, Town Hall, Southwick, Sussex.

Engineering: Iron and Steel.

JOHANNESBURG.—February 15th.—For the supply of machinery for extension of by-products plants at the municipal abattoir, for the town council.—The Town Clerk, Municipal Offices, Johannesburg.

MERTHYR.—January 17th.—For supplying and laying 760 yds. of 12-in. and 9-in. stoneware pipes, for the Merthyr and Aberdare Joint Farms Management Committee.—Mr. W. B. Harris, clerk, Town Hall, Merthyr.

AUCKLAND (New Zealand).—January 21st.—For the supply of mild-steel or iron gates and fencing, for the Harbour Board.—Messrs. W. & A. McArthur, Canberra House, 18-19 Silk-street, Cripplegate, London, E.C.

HALIFAX.—January 22nd.—For the supply of an efficient 65 per cent crude benzol recovery plant at the gasworks, for the corporation.—Mr. Percy Saunders, town clerk, Town Hall, Halifax.

Mechanically Propelled Vehicles.

LONDON.—January 24th.—For the supply of one 5-ton steam tractor and four 6-ton trailers, for the Metropolitan Asylums Board.—The Clerk, Asylums Board Offices, Thames Embankment, London, E.C.

Roads.

WOODBRIDGE.—January 15th.—For the supply of granite or basalt broken to pass through a 2½-in. gauge, and to be rejected by a 1½-in. gauge, whole chalk flints, washmill flint, pit flint, Kentish rag, and any other road material, for the rural district council.—Mr. G. Cook, district surveyor, Ipswich-road, Woodbridge.

REIGATE.—January 17th.—For tar-washing about 137,000 yds. super. of roads, for the corporation.—Mr. Fred. T. Clayton, borough surveyor, Municipal Buildings, Reigate.

BERKS.—January 19th.—For day work, carting of macadam and other materials, for the county council.—Mr. A. Langston Yockney, acting county surveyor, Shire Hall, Reading.

SOMERSET.—January 20th.—For steam rolling and scarifying, for the county council.—Mr. Gordon R. Folland, acting county surveyor, Wells, Somerset.

SOMERSET.—January 20th.—For the supply of broken granite or basalt, for the county council.—Mr. Gordon R. Folland, acting county surveyor, Wells, Somerset.

WORCESTERSHIRE.—January 20th.—For the supply of granite, blast-furnace slag, and tar-macadam, for the county council.—Mr. C. F. Gettings, county surveyor, 30 Foregate-street, Worcester.

ESSEX.—January 20th.—For the supply of team labour, stoneware pipes, Norwegian granite kerb and setts, York kerb, and distilled tar, for the county council.—Mr. Percy J. Sheldon, county surveyor, Chelmsford.

ESSEX.—January 20th.—For tar-spraying on main roads, for the county council.—Mr. Percy J. Sheldon, county surveyor, Chelmsford.

NORFOLK.—January 20th.—For the supply of flints, gravel, chalk, team labour, tools, barrows, and hand-carts, for the county council.—Mr. W. W. Gladwell, county surveyor, Shire House, Norwich.

MIDHURST.—January 21st.—For the supply of broken granite, for the rural district council.—Mr. A. G. Gibbs, surveyor, Council Offices, Midhurst, Sussex.

SLEAFORD.—January 22nd.—For carting granite and slag, for the rural district council.—Mr. Ernest H. Godson, clerk, 27 Northgate, Sleaford.

SURBITON.—January 22nd.—For the supply and delivery of refined or distilled tar, for the urban district council.—The Surveyor, Council Offices, Ewell-road, Surbiton.

DORSET.—January 24th.—For the supply of granite, basalt, limestone, and tar-macadam, for the county council.—Mr. E. H. Habgood, acting county surveyor, County Offices, Dorchester.

STRATFORD-ON-AVON.—January 27th.—For the supply of 2-in. and [illegible] slag, 2-in. and ½-in. dry slag, 2-in. and ½-in. granite, and 2-in., ½-in., and ¼-in. limestone, for the corporation.—Mr. F. W. Jones, borough surveyor, Town Hall.

SOUTH STONEHAM.—January 29th.—For the supply of British granite, to be delivered at various railway stations, for the rural district council.—Mr. F. Hendley, district surveyor, Chevan Side, Old Portswood Southampton.

NESTON.—January 31st.—For the supply of broken stone chippings and metal macadam, for the urban district council.—The surveyor, Town Hall, Neston, Cheshire.

HERTS.—February 1st.—For the supply of refined tar, to comply with the terms of the Road Board Specification, No. 1), for the county council.—Mr. J. S. Killick, county surveyor, County Surveyor's Office, Hatfield.

HERTS.—February 10th.—For surface tarring approximately 1,250,000 sq. yds. of main roads with refined tar, for the county council.—Mr. J. S. Killick, county surveyor, County Surveyor's Office, Hatfield.

Sanitary.

WILLESDEN.—January 15th.—For the removal of refuse, for the urban district council.—Mr. S. W. Ball, clerk, Municipal Offices, Dyne-road, Kilburn, N.W.

CHELMSFORD.—January 16th.—For the construction of a surface-water drain and other drainage works, for the corporation.—Mr. P. T. Harrison, borough engineer, Municipal Offices, Chelmsford.

HAMBLEDON.—January 16th.—For scavenging the district, for the rural district council.—Mr. F. Smallpiece, clerk, 138 High-street, Guildford.

MANCHESTER.—January 19th.—For the execution of general contractors' and plumbers' work in connection with drainage, for the sanitary department.—The Superintendent, Sanitary Department, Civic Buildings, Mount-street, Manchester.

NORTHWICH.—January 22nd.—For the collection and removal of refuse, for the urban district council.—Mr. J. A. Cooke, clerk, Council House, Northwich.

Stores.

PLYMOUTH.—January 15th.—For the supply of paints, varnishes, ironwork, petroleum oil, broomheads, household brushes, rope, iron and steel, pitch-pine, deals, flooring, carbolic powder, Portland cement, lubricating oils, tar and pitch, painter's brushes, explosives, soap, wood blocks, creosote, disinfectant fluid, granite kerbs, setts, white lead, red lead, linseed oil, turpentine and turpentine substitute, refilling machine revolving brooms, benzoline and motor spirit, tools, indiarubber goods, hose, and ship chandler's goods, for the corporation.—Mr. James Paton, borough engineer and surveyor, Municipal Offices, Plymouth.

OXLEY.—January 31st.—For the supply of setts, granite macadam, pitch and tar, slag dust, tar-macadam, limestone macadam, and brushes, for the urban district council.—Mr. O. Holmes, surveyor.

BATTERSEA.—January 24th.—For the supply of veterinary attendance, horse hire, materials for cart and van repairs, ironmongery, leather, harness material and fittings, paints, special paints, enamels, painters' sundries, varnish, lime, cement, granite macadam and chippings, [illegible] York paving, Thames ballast and sand, stoneware pipes, timber for carpenters and joiners' work, timber for wheelwrights' work, [illegible] roofing slates, iron castings, coal entrance covers, iron bars for blacksmiths' work, repairs to baths and street refuge and manure from the council's stables, disinfectants, coal and coke, and [illegible] for the borough council.—Mr. W. Harris, Wilcox, town clerk, Town Hall, Battersea, London, S.W.

MIDDLESBROUGH.—February 1st.—For the supply of annealed scoriæ (broken), bricks, castings, concrete flags, [illegible] Portland cement, pitch and tar, sanitary pipes, gullies, junctions, slag (broken), coal (dry [illegible]), [illegible] timber, whinstone and granite (broken), whinstone and granite setts and kerbs, brushes, bolts and nuts, disinfectants, electric lamps, general stores, glass, hardware, india rubber [illegible] steel, [illegible] oiling sets, paints and [illegible], [illegible] glass shields and shafts.

Press, Limited 24 [illegible] and copies, for the Case has done a valu[illegible] town clerk, Mumbles.—*Southport Guar*

Miscellaneous.

BANBRIDGE.—February 3rd.—For the public lighting of the urban district with gas or electricity, for the urban district council.—The Surveyor, Municipal Offices, Banbridge.

FORTHCOMING MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

JANUARY.

25. Concrete Institute: Mr. C. R. Peers on "The Care of Ancient Monuments."

APPOINTMENTS OPEN.

BOROUGH OF AYLESBURY.

Applications are invited for the appointment of Temporary Surveyor's Assistant, subject to a month's notice on either side.

Applicants must be ineligible for military service, a good Draughtsman and Surveyor, and should have had experience in a Municipal Engineer's Office.

Applications, stating age, experience, salary required, and when able to commence duties, accompanied by copies of three recent testimonials, to be delivered at my Office not later than Tuesday, January 23rd, 1917.

WM. HAROLD TAYLOR,
Borough Engineer and Surveyor.

Town Hall, Aylesbury.
January 5, 1917. (3,225)

TENDERS WANTED.

RUISLIP-NORTHWOOD URBAN DISTRICT COUNCIL.

The above Council invite Tenders for the following Supplies, delivered at Northolt Junction (G.W. and G.C. Joint Station), or Ruislip Metropolitan Station, respectively, and for the Haulage thereof:—

(*a*) 1,500 tons Tarred Slag Macadam and Slag Dust in proper proportions, at per ton each size.
100 tons Hand-picked Brick or good Concrete Hardcore, 4½-in. gauge, at per ton.
1,200 tons Coarse Gravel, 2-in. gauge, at per ton.
Clean Clinker, not less than 2-in. gauge, at per ton.
Certain delivery must be guaranteed.

(*b*) The necessary Team Labour or Haulage by Tractor of the above Materials from either Stations, at per ton for the 1st mile and 2nd miles respectively.

Tenders, sealed and endorsed "Tenders for Tarred Slag Macadam," or "Tenders for Haulage," must be delivered to the undersigned not later than 10 a.m. on January 22nd, 1917.

Separate Tenders for the Supplies or Haulage will be considered.

The Council do not bind themselves to accept the lowest or any Tender.

EDMUND R. ABBOTT,
Clerk to the Council.

Council Offices,
Northwood, Middlesex. (3,236)

COUNTY COUNCIL OF MIDDLESEX.

TO QUARRY OWNERS, GRANITE MERCHANTS AND OTHERS.

Tenders are invited for the Supply of about 7,500 tons (more or less) of 2-in. and 1½-in. Hand-broken Basalt for road construction, and 500 tons (more or less) of ¾-in. Clean Chippings, to be delivered from the various Stations in Middlesex.

Particulars, with Specification and Form of Tender, may be obtained at my Offices after Monday, the 15th instant.

Tenders must be sent to the Clerk of the County Council, Middlesex Guildhall, Westminster, S.W., by 12 o'clock (noon) on Wednesday, the 7th February, 1917.

The lowest or any Tender will not necessarily be accepted.

H. T. WAKELAM,
County Engineer.

County Engineer's Office,
Middlesex Guildhall,
Westminster, S.W.
January 9, 1917. (3,237)

The Surveyor

And Municipal and County Engineer.

Vol. LI. JANUARY 19, 1917. No. 1,305.

Minutes of Proceedings.

Water Filtration.

For various reasons the term water filtration is very often taken as including a number of other processes, such as storage, settlement, coagulation, aëration and sterilisation. Hence, when a paper is written upon the filtration of water it will often be found that the greater part of the description refers to preparatory treatment and after treatment. The cases in which filtration alone will economically purify a water up to a proper standard are either those in which the water is of a peculiar quality or those in which the system of filters is very elaborate. The popular idea that the mechanical filter is a self-contained device, whereby any raw water may be immediately purified without further treatment, ought to be removed, and it would be well if those who write papers could make this matter clearer in the title.

Elsewhere in these pages we give an account of a paper entitled "Experiences in Water Filtration," read before the Canadian Society of Civil Engineers by Mr. H. G. Hunter. The paper deals with the subject fully, giving an account of preparatory treatment, and coagulation, the construction, working and washing of filters, and also of sterilisation. As resident engineer in Montreal for the New York Continental Jewel Filtration Company, Mr. Hunter's remarks have a special application. It is to be noted that, with regard to the cleaning of the filters and to the use of strainers at the bottom of the filters, the author is not altogether in agreement with the opinions of other American engineers. He refers to the use of air to agitate the sand for washing, and to revolving rakes as being the ordinary method, but it should be remembered that in later practice the washing water is very often forced up through the gravel and sand at such a rate that the sand is floated, thereby agitating and cleansing in one operation. Neither does the author mention the fact that a properly graded layer of gravel will act as a distributor of rising wash water, rendering screens and strainers unnecessary. This leads to simplification and cheapness in the pipe underdrainage system. One may refer to the papers of Messrs. Ellms, Fuertes, Spurr Weston, Hoover, Sperry, Lovejoy, Burgess, and Siddons, and notably to a paper written by Messrs. Ellms and Gettrust, all of which have been dealt with in these pages. These papers clearly show that the opinion of the American engineers is in a great measure against the cleaning devices described by the author, and it is to be regretted that he did not deal with this opinion. On the other hand, the paper is full of valuable detail and advice such as we are accustomed to get from the other side of the Atlantic, and such as we do not receive from engineers in this country, who, although they have very large filtration plants under their control, do not seem ready for an interchange of opinions and experiences such as would without doubt throw new light on the subject and be extremely useful.

It is only natural that the author should be in favour of the use of chlorine gas for sterilisation, having regard to the new plant at Montreal for making this gas in enormous quantities. It should be remembered that there is a great difference of opinion on this point, and that Dr. Houston has in a recent report described experiments made with chlorine gas and with chloride of lime, and reported in favour of the use of chloride of lime for the sterilisation of the London water. The claims made for the quick action of chlorine gas were not supported by the tests made by Dr. Houston.

* * *

Rural Repopulation.

In view of the exceptional importance which attaches at the present time to every phase of the problem of national reorganisation after the war, a paper on "The Repopulation of Our Rural Districts," which was read by Mr. Theodore Chambers at the last meeting of the Surveyors' Institution, is of special interest. While it is true that, broadly speaking, the subject is one which does not directly affect municipal engineers as such, yet, as Mr. Chambers was able to show, they must be concerned in it to some extent, inasmuch as it involves a consideration of the problems of overcrowding and rural housing. Indeed, if the object be to get more people on to the land, to increase our home-grown food supply, and to remedy the evils of crowding into cities, then it will be necessary so to improve the conditions of rural life as not only to retain the present rural population, but also to attract people from the towns. Mr. Chambers' main idea was not directed to an increase in the number of people in rural areas who are directly engaged in agricultural pursuits—important as this end is in itself—but rather to securing what he described as a bold policy of industrial penetration of the country. In other words, he desires to break down the present artificial division of the population into two camps, town and country, with completely different and often hostile economic conceptions. The fact is that we have never quite got away from the tradition of the time when cities were clearly and definitely bounded by walls and fortifications. In those days the distinction between town and country was an essential one

The town stood for commerce and industry, and the country for agriculture, and agriculture only. Now, however, we have a large rural population not directly engaged in agricultural pursuits, a population which would be increased to the benefit of both town and country if the "industrial penetration" advocated by Mr. Chambers were to take place on any considerable scale. His thesis is that society has it in its power, if it chooses to exert itself in certain directions, to modify the present conditions, and to produce other conditions which will cause men other than agricultural workers to remain in the rural districts for preference, and even attract people away from the towns into the country. In this connection the question of improved transport facilities becomes of great importance. If factories are established in the vicinity of railways in country districts, it at once becomes possible to avoid the burden of high rents and high rates and the hindrances to rapid expansion which exist in the congested conditions of the city, where, indeed, expansion of any kind is often a matter of impossibility.

We observe with pleasure that towards the end of his paper Mr. Chambers had a good word to say for the dignity of municipal work and the status of municipal officials. Town management in the future, he says, should be one of the great professions, requiring a training in economics, civil welfare, town planning, and social work of every description. The position of town manager (or civic engineer) should be coveted by men of high attainments and great skill. By this means the whole tone of local self-government would be raised. With this, of course, we cordially agree. Once the public importance of the work is recognised, as it ought to have been years ago, we may perhaps hope to see that improvement in the conditions of the municipal service, as regards pay, status and security of tenure, which we have been consistently advocating for many years past.

Industrial Research.

At the last meeting of the Junior Institution of Engineers the subject of industrial research, which is so much to the fore just now, was under discussion, being introduced by a very able paper by Mr. A. P. M. Fleming, of Manchester. The national importance of industrial research may be stated as a syllogism. Industrial progress depends on the acquisition and use of new knowledge; research is the acquisition and application of new knowledge; therefore industrial progress depends on research. Mr. Fleming showed that properly organised research is of benefit not only to the manufacturer, but also to the manual worker, the financier, the educationist, and the community generally. The worker is bound to feel any increased prosperity in his industry caused by the introduction of new and improved methods, while to the financier research is of importance in that it provides him with new fields for the profitable employment of capital. The educational advantages of research are so obvious that they hardly need emphasis, and the community as a whole must ultimately benefit by the discovery of new secrets of Nature and their application to industrial purposes. In considering the question of research, it is not without interest to reflect that some of the researches most important to industry, and especially to engineering projects, have been carried on in contemporary sciences, as, for instance, the case of the prevention of malaria and the construction of the Panama Canal, the developments in aviation dependent upon the petrol motor, &c. In other directions the research efforts that have been made to cure, for example, tuberculosis, will, if successful, have marked effect in conserving the man-power, and therefore the productive capacity of the community, while physiological researches concerning fatigue and efficiency of workers may have far-reaching results.

As compared with America, industrial research in this country is still in a condition which can only be described as embryonic. Much progress has been made in the laboratories of universities by individual scientists who have devoted their attention largely to pure science investigations. In many cases individual firms have secured the assistance of the university laboratories in carrying out researches to meet their particular requirements. In the future, however, it will be more and more necessary for the firms of each industry to consider what processes, tools, and methods are common to all of them, and to co-operate in producing the greatest possible improvement in connection therewith for the benefit of all. It seems probable that the plans provided by the Government during the past two years for the assistance of industrial research, now merged into the undertaking known as the Imperial Trust for the Encouragement of Scientific and Industrial Research, will be directed to co-operation with industrial groups rather than with individual firms. In process of time, however, it is to be hoped that research work may be merged into one institution, which would centralise research for all industries. Such an institution would have the additional advantage of serving as the centre for the collection and distribution of information from all sources that could be turned to account in industry.

The Burgh of Buckie and their Contractors.

An important case with respect to the right of contractors to remove their plant was decided recently in an appeal heard in the Court of Session at Edinburgh. The plaintiffs were the Corporation of Buckie, and the appellants, Messrs. Charles Brand & Son, of Glasgow, were contractors for works of harbour extension, now approaching completion. They had removed some of their plant, and had intimated their intention to remove such additional plant as was no longer required for the remaining work to be done. The terms and conditions of the contract provided that all vessels, plant, and material provided by the contractors should become the absolute property of the town council, and should not be removed from the site without the written sanction of the engineer, whose firm had been appointed by the corporation. Application was made to him for his sanction to the removal of certain plant, and he informed the town council of the application, which he was of opinion ought to be granted. The town council informed the engineer that he was their servant in this matter, and instructed him to withhold his consent. In pursuance of these instructions the engineer replied to the defendants that he was unable to grant permission. At a later stage, however, and again on the instructions of the town council, he told the defendants that they were at liberty to remove certain wagons provided the price was deposited with the town council as security, in addition to £4,000 of retention money already held by them. The contention of the defendants on appeal was that the town council's change of front came too late, and that they were not bound to accept the decision of the engineer on the ground that he was disqualified by having already decided the question in dispute against them. They argued further that the town council in controlling the engineer had broken their contract, and had no title to rely upon the absence of information which they caused him to withhold. The Divisional Court virtually upheld the view of the sheriff-substitute that, as the town council had renounced the posi-

tion that they were entitled to control the engineer, and since the latter had merely acted on a wrong view of his legal position, there was no reason for the contractors thinking he was biassed against them, nor why he should not proceed to consider an application for the removal of the plant. The whole trouble, the Court declared, had been caused by the wrongful attitude taken up by the town council, who were found liable in costs. The decision is chiefly instructive as determining the legal position of the engineer and the illegality of the position of the burgh council in interfering with him in the exercise of his discretion. They had obviously dropped into the common error that, as they had appointed him, they were therefore entitled to control him in their own interests.

Right to Inspect Documents.

Is a member of a local authority entitled as of right to see all books and documents in the custody of the council and relating to official business? This interesting question was asked—and answered—in the course of certain High Court proceedings on Monday last, when an alderman and ex-mayor of a Metropolitan borough sought a mandamus to compel the production to him of certain documents, inspection of which had been refused by the town clerk acting on the instructions of the Public Health Committee. It appears from the arguments that were addressed to the Court that both parties agreed that, in the absence of special circumstances, the alderman would have been entitled to the inspection which he desired. It was alleged, however, that in asking to see the documents in question he was not actuated solely by motives connected directly with the proper discharge of his duties as a member of the council, but that he had, consciously or unconsciously, another indirect motive. The documents had reference to a closing order which had been made by the council in 1911 under the Housing, Town Planning, &c., Act, 1909, and which had been the subject of appeals to the Local Government Board and litigation ever since. It appears that the alderman had come to the conclusion that the closing order ought now to be determined, as in his opinion, formed after seeing the house to which it referred, the house was now fit for habitation. He thereupon gave evidence for the owner at a Local Government Board inquiry, and also in the course of a Chancery action that had been commenced by the owner against the council. Of course, as the Court made perfectly clear, he was acting quite within his rights in doing so, but they held that he had so identified himself with the owner that in the circumstances his common law right to see documents ought not to be enforced by the discretionary writ of mandamus.

A Record Salary.

The limit in small salaries appears to have been reached by the Narberth, Carmarthenshire, Urban District Council, whose surveyor tendered his resignation at the last meeting, one of the grounds being that "the salary (sic) he received for doing all the work pertaining to the office of surveyor amounted to only 4d. a day, and there was a good bit of work to be done." What would happen, we are tempted to ask, if he were called up for military service? Would the council expect him to pay them the difference between his military pay and his civil remuneration, as other authorities make up such differences to their officers absent on service? We can almost believe that they would. At all events, his plea for an increase, on the ground that the price of all necessaries had risen abnormally, was met by one member with the remark that everything had gone up for the ratepayers too. Another reason put forward for the resignation was that, as the council did not advance the necessary money with which to pay wages, the surveyor had to run all over the town to borrow it. It may be that the council expected him to advance the wages out of his "salary," but unless other wages were on equally princely lines this was clearly impossible. As a result of discussion, some account of which will be found in another column, it was resolved to ask the surveyor to continue in office and to let the question of salary remain in abeyance until after the war. He asked to be allowed a month in which to consider this suggestion, and this request was granted.

* * *

A Famous Well.

At the recent monthly meeting of the Holywell (North Wales) Urban District Council the members had before them a laconic report by the surveyor in the following terms: "I very much regret to report that on Friday last St. Winefride's Well ran dry." The reference was, of course, to the famous curative spring, supposed to be of miraculous origin, and the town of Holywell owes its prosperity in no small measure to the numbers of pilgrims who resorted annually to the "Holy well." The alleged cause of the failure is, in the circumstances, a little prosaic, as it is supposed to be due to the boring operations of the Halkin Drainage Company and the Holywell Halkin Tunnel Company. Be this as it may, there can be no doubt as to the serious results to the town of the stoppage of the flow of water, and the council no doubt acted wisely in appointing a committee to take the necessary steps to ascertain the legal position. Our contemporary the *Manchester Guardian* suggests that, with a little imagination, the failure of the spring might even be laid directly to the war's evil account—inasmuch as the custodian of the well was recently given a month to prepare himself for entrance into the Army, and a well with a miraculous origin might not inconceivably have its own method of registering disapproval of interference with its affairs by a military representative. If this be so, it may be that, as one member of the council suggested, the water may return as suddenly as it has disappeared.

* * *

Fence Walls on Main Roads.

On many occasions the West Riding County Council have received requests from highway authorities in the Riding to build or repair fence walls adjoining main roads, but have hitherto refused to undertake any responsibility in respect thereof unless their liability could be established. In the official gazette for January of the County Councils Association it is stated that the question has now been reconsidered, and inquiries made from several county councils show that the practice varies. The council have come to the conclusion that they ought to take into consideration certain cases where the absence of a fence is likely to be a source of danger to the public, and therefore are prepared to consider the question of paying for, or contributing to, the maintenance or building of fence walls in such cases, and where it cannot be ascertained that local authorities or private owners are responsible.

"THE SURVEYOR" SPECIAL ISSUE.

The Special Annual Issue of "The Surveyor" will be published on Friday next, and readers who propose to accede to our request for a short statement, for inclusion in the number, of the works projected by their authorities for 1917, will greatly oblige by making their return not later than Monday next.

Specifications for Highway Bridges.

[The following proposed specifications for highway bridges, prepared by a committee of the Canadian Society of Civil Engineers, were discussed at a recent meeting of the Mechanical Section of that body. Copies of the proposed specifications have been sent to the various branches of the society for their observations and when these have been received the committee will make their final recommendations to the annual meeting.]

These specifications are intended to apply to steel highway bridges carrying ordinary highway traffic with or without electric street cars. They will not, however, cover bridges which carry electric railways only, as these will be designed under the specification for steel railway bridges.

In the case of combination bridges, carrying both railway and highway traffic, the responsible engineers on each individual project will be expected to issue particular specifications governing the questions of loading and unit stresses. Further, insomuch that modern practice has adopted riveted structures for all ordinary highway work, the specifications will not cover pin bridges, so that in the instance of long and important structures, where eye-bars and pin connections might possibly be used to advantage, special clauses covering this class of work will need to be drawn up by the responsible engineer.

The range of service to be accommodated under the general head of highway traffic is, necessarily, extremely wide, but the following are the principal considerations which will enter fundamentally into the design of those structures covered by this specification —

(1) The amount of money available for the construction and its effect on the question of the permanency or semi-permanency of the bridge and upon the question of providing for probable future increase in traffic.

(2) The location of the bridge and the character of the roads in its neighbourhood with the probability of their being subject to improvement

(3) The situation with respect to traffic as affecting the character of the flooring and the nature and magnitude of the superimposed loads.

With a view to meeting the whole range of conditions the specification classifies bridges according to the requirements of service and permanency under the following heads:—

Class 1 is intended to provide for first-class permanent structures situated on main arteries of traffic in large towns and cities where heavy concentrated loads, due to transportation of machinery and building material frequently occur. Bridges as designed under this class will be equal in respect to permanency, rigidity, thickness of metal, and all details, to those built under the best railway practice.

Class 2 is intended to provide for city bridges in residential districts, where general traffic regulations limit both the loads carried on the highway and the speed of street car traffic. Bridges designed under this class will be equal to those designed under Class 1 in respect of general stiffness and constructional details.

Class 3 is intended to provide for highway bridges in towns where heavy manufacturing is not conducted and for bridges on main country highways. The need of providing for actual or possible street car traffic and the issuing of specifications regarding the street car loads are matters which will be left to the responsible engineer.

Class 4 is intended to govern roadway bridges serving farming communities and situated on unpaved roads where it is unlikely that the character of the loading will change during the normal life of the structure.

Class 5 is intended to provide for bridges in remote or mountainous districts difficult of access, where lightness and first cost are prime considerations in determining the character of the proposed bridge.

The purpose of the classification is not rigidly to force every bridge under a specific head, but to guide the responsible engineer or purchasing authority in the making of suitable decisions regarding loads, unit stresses and general design. In consequence whereof the clauses touching upon these essential questions will refer to the various classes suggested. The engineer on important bridges will still be expected to use his professional judgment and his knowledge of local conditions, either of which may justifiably lead him to a combination or modification of the classes here outlined or of the clauses in the specification referring thereto.

MOVABLE BRIDGES.

The specifications cover the design of the structural work for all kinds of movable spans, and include clauses governing the design of the machinery and machined parts of hand-operated swing bridges. In the case of power-operated swing spans, bascule or vertical lift bridges, where the machinery is an all-important feature of the construction, it is recommended that the design of these features be referred to an engineer specialising in this work.

FLOORS.

For bridges built under Classes 1 and 2 a careful description of the floor system to be employed should be supplied by the responsible engineer, preferably by drawing or detail sketch. Special care should be taken to indicate the proposed method of carrying street car tracks.

A "permanent" floor shall be understood to signify a floor where the base consists of either—

(*a*) Reinforced concrete slabs.

(*b*) Concrete or brick jack arches.

(*c*) Buckle or trough plates carrying the concrete matte.

A floor where the base is wood, whether creosoted or not, will not be considered permanent.

Under Class 1 a permanent type of floor is everywhere demanded, and the pavement or upper course shall be of granite setts, brick, asphalt, macadam, or treated wood blocks, as determined by the engineer.

Under Classes 2 and 3 the character of the floor will be specified directly by the responsible engineer, but it is stipulated that the stringers shall be of steel, and the structure shall be designed to carry at the specified unit stresses a floor consisting of a reinforced concrete base with a pavement of 4-in. wood blocks, or any other heavier type which may subsequently be laid.

Under Class 4 a wooden floor is permitted, but the adoption of steel stringers is recommended.

Under Class 5 the lightest type of wooden floor is allowed, but even here an inquiry into the probable ultimate economy of longer panels with steel stringers is suggested.

SIDEWALKS.

Under Class 1 sidewalks shall also be permanent, and shall have a cement finish to the slab or a special wearing surface of asphalt or granolithic paving. For the remaining classes sidewalks may be of wood at the discretion of the responsible engineer.

WOODEN FLOORS.

Wooden stringers shall not be used on greater spans than 15 ft., and shall have a width of not less than 3 in. or one-fourth of their depth. They shall lap by each other on the floor beams to give each a full bearing, and shall be bolted together, using washer separators not less than ¼ in. thick, in order to secure free circulation of air.

WHEEL GUARDS.

On wooden floors wheel guards, of 6 by 4 timber, shall be provided at each side of the roadway, and shall be supported on 2-in. blocks spaced not over 5 ft., held in place by a ¾-in. bolt through the guard, the blocking piece and the timber floor. The splices in wheel guards shall be half-lap joints 6 in. long, and shall occur over the blocking pieces.

For permanent floors the wheel guard will generally be formed of concrete effectively protected by steel angle rubbing pieces.

SCUPPERS.

On permanent floors of any description suitable scuppers shall be provided not less than 20 ft. apart, so arranged to carry all drainage clear of steelwork.

LIVE LOADS.

The varied character of the loads applied to highway bridges renders it impossible to include in a general specification a statement of the precise loading to be used on every bridge, and any table of suggested

typical loads must be recognised as necessarily having the following limited purposes:—

(a) To guide the responsible engineer in his choice of a structure in regard to capacity and efficiency.

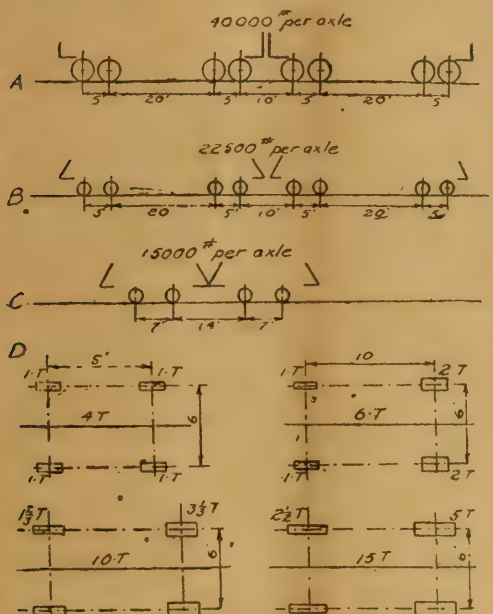
(b) To indicate to non-technical officials or to engineers not specially experienced in bridge work what constitutes accepted good practice.

(c) To guard against the possibility of a structure being provided which is insufficient to meet the immediate requirements or those reasonably certain to occur in the future.

On the other hand, the specifications should not prevent the building of very light bridges, which, while sufficiently strong to withstand the vertical and vibratory loadings, should be able to compete successfully in the matter of first cost and maintenance with the alternative wooden construction. The majority of existing light structures, which would fall under the fifth class, above indicated, have not been built to any of the recognised standard specifications, and, indeed, no present specifications in vogue in Canada permit of this, nevertheless necessary, class of bridge. With the idea of meeting both the financial and service requirements of such cases, the permissible loadings under Class 5, as well as certain other limitations, are less exacting than in the existing standard specifications.

TWO MAIN DIVISIONS.

The loading on a highway bridge naturally falls under two main divisions, the assumed uniformly distributed load and concentrated wheel loads. The



DIAGRAMS OF WHEEL LOADS APPLYING TO STEEL HIGHWAY BRIDGES.

first division will consist, generally, of crowds of people, animals in droves, or a large number of light vehicles. Crowds of people, such as quickly gather at accidents or for sight-seeing on city bridges, are seldom productive of 100 lb. sq. ft. average load, and for moving loads this figure would undoubtedly cover all cases to be provided for at ordinary unit stresses. Classes 1 and 2 are likely to experience such loads at frequent intervals and for almost unlimited lengths, while Classes 3 and 4 may receive the same intensity of loading, but far less often, and over smaller areas. Animals in droves will never exceed 60 lb. per sq. ft., and for Class 5 this would represent the maximum load.

The second division will include all classes of heavy vehicles, such as street cars, auto trucks, horse-drawn lorries, and road-making machinery. Local conditions alone can determine the type and magnitude of loading for which steel should be proportioned.

In bridges of Classes 1 and 2 the proximity of factories, wharves, railway yards, the nature of the street car service, the possibility of loads, due to building materials, cable spools, heavy guns, steam rollers, or traction engines, must all be duly considered in specifying the applied concentrations. It may also be noted here that the authorities owning these classes of bridges are also generally empowered to regulate traffic, and it will devolve upon their executive engineer to consider the principle of equity involved in the question whether the publicly owned bridge should be capable of accommodating some unusual "freak" load, avoidable at a certain cost to the transportation company, or whether the traffic regulations should not control the use of the bridge for such purposes on the basis of engineering economics.

The figures given in the following tables are considered safe maximums for usual cases, and are recommended for adoption only in default of specific information from the responsible engineer.

IMPACT.

The function of the so-called impact allowance is twofold. First, to take care of actual increases in the magnitude of the applied load liable to occur at infrequent intervals. Secondly, to make provision for the increased stresses due to dynamic application of the loads. To the uniformly distributed loads described above only the first aspect of impact will apply, and in so much as same maximum figures are recommended for adoption, no further increment for use at normal unit stresses is considered necessary. To concentrated wheel loads both aspects of impact may be presumed to apply, and a simple percentage of the static load is suggested as the increment. It is believed that the effects of the dead load and the length of the span affected are suitably provided for in this percentage, in so much as the concentrated loads will in general govern floor members only, and the type and weight of floor will bear some sensible relation to the magnitude and ferocity of the wheel loads.

TABLE OF LIVE LOADS.

(1) For floor stringers, cross beams, hangers, and any members of trusses and girders where concentrated wheel loads govern the sections.

	Uniform load.	Street cars.	Trucks, &c. See diagram D.
Class 1	100 lb. per sq. ft.	Diagram A	2-15 ton alongside or following
Class 2	100 lb. per sq. ft.	Diagram B	1-15 ton
Class 3	100 lb. per sq. ft.	Diagram B or C (if any)	1-10 ton
Class 4	80 lb. per sq. ft.	None	1-6 ton
Class 5	60 lb. per sq. ft.	None	1-4 ton

2. For trusses and girders.

	Uniform load.	Street cars.
Class 1.	100 lb. per sq. ft. up to 200 ft., thence diminishing arithmetically to a minimum of 75 lb. at 400 ft.	2,400 lb. per ft. per track for freight cars. 2,000 lb. per ft. per track for passenger cars
Class 2.	100 lb. per sq. ft. up to 100 ft., thence diminishing arithmetically to a minimum of 60 lb. at 300 ft.	2,000 lb. per ft. per track.
Class 3.	80 lb. per sq. ft. up to 100 ft., thence diminishing arithmetically to a minimum of 50 lb. at 200 ft.	1,600 lb. per ft. per track (if any)
Class 4.	80 lb. per sq. ft. up to 80 ft., thence diminishing arithmetically to a minimum of 50 lb. at 200 ft.	None
Class 5.	60 lb. per sq. ft. up to 60 ft., thence diminishing arithmetically to a minimum of 40 lb. at 100 ft.	None

SCOPE AND COMBINATION OF LOADS.

Uniform live load shall be applied to full width of road surface between wheel guards and on sidewalks to the maximum clear width available for traffic. The assumed equivalent uniform live load for street cars shall be applicable to the whole length of the trackage on the span or any portion thereof. Each street car track shall be assumed to occupy 10 ft. width of roadway. The following combinations shall be considered possible.

Street car loads and other concentrated or uniform loads for floor beams and hangers.

Street car loads and half uniform load on remainder of floor surface for trusses of Classes 1, 2 and 3.

When sidewalks are carried on brackets outside of the main trusses, provision shall be made in the trusses for the cantilever effect of loading one sidewalk and the full road surface between trusses with 75 per cent of the specified uniform loading.

IMPACT.

The percentages of the live load from wheel concentrations to be added for impact will be as follows —

To stringers 40 per cent.

To floor beams and hangers and other truss members affected, 20 per cent.

A Survey of Municipal Engineering.

By EDWARD WHITWELL, F.I.S.E., M.S.A., Engineer and Surveyor to the Abersychan Urban District Council, Lieut. R.N.V.R., President of the Institution of Municipal Engineers.

[Inaugural address to the Institution of Municipal Engineers—concluded from last week.]

Many authorities in the early days possessed themselves of baths and wash-houses, and financially met with varying success. Latterly the tendency has been to separate the two, and in the result we find that many more baths are erected than wash-houses, and that, while the former are rapidly increasing in popularity, the latter are not in fact declining. Probably the explanation is to be found in the fact that housing conditions, which are fast improving, include better provision for family washing than was the case a few years ago, and that greater attention is being paid to the physical welfare of the young than formerly.

The swimming bath has generally not been in great favour with the authorities, because swimming has been so little encouraged as to result in high charges in order to try and reduce the expectant amount of loss on the season's working, and in the result for many years progress has been stagnated. Now a different view is being taken, and while the authorities are discovering that the financial exercise provided by this form of sport more than compensates for the slight loss of working, they are concurrently finding that its popularity converts the loss into a profit, and are inclined to wonder why the art of natation has been so reluctantly encouraged. In my own case I found an authority seven years ago just deciding by a single majority vote to provide a swimming bath for a population of 25,000, which within five years builds a second, and would have erected a third by now but for the war.

In the particular instance referred to I may state that, on my advice, the maximum charge for admission is one penny, and that I prevailed upon the county authorities to include swimming in their curriculum, with the result every child (boy and girl) attending the elementary schools in Standard I. [illegible] has the opportunity to attend the swimming baths once weekly absolutely free of charge. I made the arrangements quite complete by providing free instructors, who specially follow the progress of each child, encouraging it in every possible way, and at the present time there are nearly 3,000 children learning or practising swimming. As may be conceived, the baths are really a financial asset, but were it otherwise the district would be more than amply repaid by the better physique of manhood and womanhood, and by the valuable asset possessed by each of being able to swim. Without doubt the provision of facilities for swimming should be as obligatory as many of the other things which are in municipal life, since the investment is really one in which the dividend is to be found in a better and healthier people.

COLLECTION AND DISPOSAL OF REFUSE.

One of the very earliest requirements for the good of the public was the collection and removal of house refuse, but [illegible] in the matter of collection very little progress has been made since the law came into operation.

We all know how exceedingly distasteful and unsightly are the contents of pails of refuse which are either allowed to collect in bins, ashpits, or heaps, and are [illegible] periodically, and we all know how unsatisfactory is the work of the collectors. Granted that a better step was taken in the dissemination of the liquid by the water carriage system of [illegible] effluent seems possible to be found to deal satisfactorily with the remaining crude conditions.

In many towns an exchange of sanitary bins is made [illegible] and the system to date, while still leaving something to be desired, is the most cleanly. At the same time it is the most costly, and generally [illegible] is operating one will find that the collectors have to enter the [illegible] the living-rooms of the occupiers, and [illegible] the front door a most miserable object of offence, and sometimes as undesirable one should pass [illegible] acquaintance be calling upon you when the collector is present, and the latter accidentally [illegible] a portion of the [illegible] on the hall floor. Other methods have their disadvantages [illegible] to be overcome here, though I believe I [illegible] which requires the [illegible] on the part of the [illegible] a certain degree of [illegible] which as often as not falls to the lady of the house; the receptacle which is the happy hunting-ground of all the four-footed animals in the neighbourhood—the same animals are generally most affectionately embraced by the householders or their children within the same hour—and the delight of the mischievous schoolboy who explores it for treasures or empties it into the street, as the mood takes him. Probably the most crude, insanitary and unsightly of all methods of storage and collection is that which is prevalent in some towns I have seen. There huge cast-iron bins are provided, capable of holding from 36 to 100 cub. ft. of household refuse, and are placed alongside the main and other thoroughfares, or on the open spaces, where their putrefying contents are investigated by every dog and cat in the neighbourhood, and where the bins are used very often as excellent hiding-places by the children in their many games. In these big receptacles the refuse is allowed to stand, generally for a week, before collection, and in the result it is found that every wind or gale provides a storm of flying dust, ashes, or paper for the assimilation of any luckless passer-by. Could anything more ghastly, crude, or unsatisfactory be conceived in this the twentieth century?

I have been in a district where this system was actually extending, and, needless almost to state, my advent heralded a change in the procedure, a stop on the extensions, and a rapid deviation from it to something much more satisfactory. Its displacement by the bin system led to much better results, and, by the introduction of bells to the collecting carts, reduced the animal and mischievous boy's evil to a minimum.

The most economical and satisfactory system of storage is, to my mind, however, that provided in the several large housing schemes for which I have been responsible. Here the occupant places the refuse into a receptacle hooked on to a door built with its frame into the wall of the back street, and so arranged that the receptacle cannot be removed from the door unless it is opened. As the only person with the key is the collector who calls and empties the bin three times per week, and as it is protected from cats, dogs and children, it is obvious that, for cleanliness and economy, the system is hard to beat. Personally, however, I am looking forward to the solution of the problem on different lines, and, given the co-operation of the householder to properly limit his refuse to the legal definition, to finding that the model city of the future will be provided with a system of conduits which, having endless travelling floors and openings at all premises, will convey the refuse to definite collecting centres, from whence it can be conveyed, still underground, to the place of its disposal. Such a system may or may not appear to be more costly, but whether it be so or not, we must realise that those systems which are essential to the full and proper safeguarding of the public health are the most economical in the end.

To the question of disposal there can be but one answer, and that is, by burning. A few years ago the remedy, by providing dust destructors, was almost worse than the disease, but with the experience gained and the improvements effected, there is now no doubt that this is the only satisfactory way of disposing of the waste matters. Various patent processes, by which the wastes may be utilised in various forms, may now and again catch the public eye, but a calm consideration of the whole question, and a full realisation of the amount of latent power contained in the refuse, at once disposes of them all.

As yet the public mind has not thoroughly grasped the potentialities of the waste matters of a community, and is rather inclined to regard them as a costly nuisance which must now be dealt with in some more effective fashion than that of dumping on waste lands, but gradually the experience and foresight of municipalities like Blackpool is reaching it, and in consequence we are slowly, but surely, approaching the subject in a more resolute and determined manner. Many authorities, however, do not yet grasp the situation properly, and, while not unfavourable to the erection of these institutions, are opposed to utilising

the latent power therein on the grounds that the destruction of the refuse is the only object, and that this should not be the excuse for a type of municipal trading. And yet the same authorities will plant vegetables on their sewage farm and sell them to those who will buy!

That any authority would permit the latent power of municipal refuse to go to waste is, to my mind, almost unbelievable, and yet in the experience of the members of this institution it is known to be the case. At the same time I think every member is convinced that it is his duty to influence his authority for the public good by persuading it otherwise.

WATER SUPPLIES.

This is a department which falls to the lot of many engineers to control, and, outside the construction of the great bases of supply, chiefly takes the form of administration. With the provisions made to safeguard the purity of the water, which is probably the first essential to human existence after air, most members are well acquainted, while hard-and-fast rules are generally in existence to secure uniformity of distribution. In any event, it is fully recognised that the greatest dangers to the pure supplies of water lie in the distributing channels rather than at the base; hence every precaution should be taken to prevent possible sources of contamination being contiguous thereto.

In many districts the regulations will not permit of the drains, gas pipes, and water pipes being laid in the same trench, and yet in others you will find an absolute disregard of this elementary precaution. In many other matters some authorities are similarly lax in their control, especially in districts where the supply is intermittent, and they may be said to be courting grave danger. Generally, however, this is a department which leaves little to be complained of. From the public point of view but few of us recognise how really cheap this essential to existence is, how lightly we value it, and how freely we waste it.

As is well known, one of the greatest troubles of distribution in some districts is that traceable to corroded mains, and while ingenious contrivances have been found by means of which periodical cleansing can take place, yet none of them safeguard the smaller pipes from the same evil, and consequently an enormous expense is annually incurred in replacements. That some means of actually arresting the corrosion would be infinitely more satisfactory is evident, and I am rather looking to the introduction of some preparation, by a treatment of the conveyers, to bring this about on the principle that prevention is better than cure.

ELECTRIC AND GAS SUPPLIES.

The controversy as to the relative merits of gas and electricity is still being keenly waged with contradictory proofs from various districts as to which is really the most economical. To the engineer who may have both under his control the keenness of the competition hardly appeals, but to one who only has one of them, while a private company owns the other, it is clear that he must keep himself fully alive to all the improvements and devices which will tend to popularise and cheapen the commodity he is dealing in if he is not to be left behind in the race for supremacy. Of course, the limitations to this address prevent one from entering into their respective merits, though I am inclined to the opinion that at present gas appears to hold the sway economically, while electricity leads in every other field.

For public lighting, electricity is rapidly overhauling gas, in spite of the impetus given to gas by the incandescent mantle; and when one reflects on the grave difficulties attending incandescent lighting during great storms, storms in which the electric lamp glows unmoved, one does not wonder at it.

For domestic work, lighting, cooking, and heating, electricity is becoming more in favour by reason of its greater cleanliness, readiness, and safety; though to realise this fully one must visit a town where electricity is supreme. With a greater economy of production and distribution it is quite evident that its application cannot help but soon be universal.

SUPERANNUATION.

The reference to this has been dissociated from the question of security of tenure because, I believe, the two possess no actual relation, and because engineers have a much better prospect of getting them separately. At the present moment it is fully realised that this is a question which must of necessity stay in abeyance until the more pressing problems of the war have been dealt with, but it is timely to refer to the matter with a view to its claims being considered just as soon as circumstances permit, and in the hope that the illogical position of the only public department without adequate provision for superannuation, whether by self-contribution or otherwise, shall be removed.

OTHER DEPARTMENTS.

There are many other departments in which the municipal engineer is interested, and concerning which he has to be more or less of an expert,—namely, building, private street work, public vehicle control, pleasure grounds, allotments, &c., of which the two former require the exercise of more diplomacy, with firmness, than the rest. In the matter of building by-laws, everyone knows how difficult it is to secure exact or uniform compliance when some of them, which an unbending bureaucracy insists on retaining, are as absurd as it is possible for them to be, and when, on the other hand, a weak authority permits of the occasional disregard of the most essential, I think it may be safely said that building by-law enforcement has placed the public official more often in an unenviable and regrettable position than all the other departments together, and this enforcement alone has fully justified the official claim for Government protection in the way of security of tenure. Whether the simplification of the by-laws on sensible lines will lead to more co-operation on the part of the builder is a matter of doubt, while to permit of building without by-laws would lead to his return to the erection of the slumdom which is the blot on the present day, and which is being in many districts granted attenuated life by generous, though oft shortsighted, authorities. One of the most frequently repeated arguments that the surveyor meets with is that these are "by-laws made in London largely to suit London, and consequently it is absurd to build as if you were in London." A remodelling on sensible minimum lines, with an inclusion of other requisite provisions, would greatly assist the official responsible for the present difficult task.

THE TRAINING OF THE ENGINEER.

I do not think that this address would be complete without some reference to this very important matter. Time and time again the matter has been brought to the notice of the professional world that it is as important to provide the future engineer with a thorough base on which the structure of his professional attainments can be built as it is to provide proper foundations for a heavy edifice; and the general conclusion is that the stronger the foundations are the more it is possible to build upon them. All this is perfectly true, for it is inconceivable to think that all engineers without this preliminary preparation would be as fitted as they are to-day if this had been denied them; but it is also perfectly true that many engineers fail to build upon the foundation given them the structures for which the foundation has been prepared, and this is a great matter of regret. The lackadaisical system which still prevails of selecting a profession for the child without regard to its fittedness or bent has led in the past to many failures, while, on the other hand, some of the leading engineers of the day are men whose early training was not strictly confined to the sphere in which they have met with so much success. In other words, men without that early academical and professional training which would without doubt have greatly facilitated and accelerated their progress have outstepped many who have had every facility given them and every opportunity open to them, because of their greater fittedness for their professions, and because of the general inadaptability of the less successful man. Undoubtedly the first step in the making of an engineer is to see that his natural bent is inclined to that end; the second, to commence at the earliest possible moment to encourage that bent; the third, to provide academical and professional training by attractive, efficient, and effective methods. If then the budding engineer has the courage, the tenacity, and the personality, he will succeed, and be an asset to the engineering world.

To the engineer in the embryo stage I would emphasise the great need of his pursuing his studies until he is capable of taking the institution's examination, and then of diligently continuing to keep pace with the progress being made in the departments in which he is interested until he has attained all the success of which he is capable in the sphere in which he works. He may have many years to run, but all the time he runs he approaches nearer and nearer the goal of success, he leaves further and further behind the starting point, and he finds fewer competitors to vie with him for the best that the profession holds, and

all the time the engineering world is profiting by his diligence.

GENERAL.

Before concluding this address I should like again to express my deep appreciation of the very high honour which has been bestowed upon me and on the municipal authority it is my pleasure to serve, and to express the determination to further the aims and objects of the institution by all means that are in my power during my term of office. During the period of my membership of the council and of my association, as an associate with the presidents, the fellow vice-presidents, and secretary has afforded an unbroken pleasure and I am looking forward to continued happy associations in fulfilling the aims and objects of the institution. Particularly have I to express my sincere appreciation of the cordiality and assistance given me by the retiring president, Mr. H. C. Adams, the geniality and helpfulness of the past-presidents, Mr. Matthews Jones, Mr. H. Stickland, Mr. H. Boot, and others, and to the happy and co-operative relations with our excellent and painstaking secretary, Mr. Wyand. These gentlemen are the pillars of the institution, and it is to them that the institution owes so much of its splendid success.

I must again also express the fervent hope that before another annual meeting we shall experience that happy reunion with our brothers who are fighting side by side for the honour of Old England, and that it shall mark the dawn of a lasting and honourable peace which shall know no end.

Following the reading of the foregoing address at the annual meeting of the Institution of Municipal Engineers a vote of thanks to the president was proposed by Mr. H. C. H. Shenton. In seconding, Mr. L. C. Barrable remarked that there were evidently many other excellent things coming out of Wales than a certain distinguished gentleman who would be nameless.

The proposition was carried with acclamation.

Ystradgynlais Council Offices.—The Ystradgynlais Rural District Council's new offices in Glanley-street were opened on the 11th inst., the ceremony being performed by Mr. Thos. Watkins, who has occupied the post of surveyor to the council and their predecessors the Ystradgynlais District Highway Board, for a period of thirty years.

The Rainfall of 1916.—At the last meeting of the Thames Conservancy Lord Desborough, the chairman, said he had received figures as to the rainfall from Oxford west which had been corrected by comparison with Dr. Miller's records with which they substantially agreed. Their own figures were taken at ten different stations in the Thames Valley, and were very interesting. During the year 1916 they had almost exactly the same amount of rain as they had in 1915—27·5 in. It was rather interesting to note that the last five years had been very wet years, the average rainfall being 33·8 in., which compared with 27·2 in. for the preceding twenty-nine years. It would be very clear also that for the past five years the excess of rain had been very large. Last year, in regard to the volume of water with which they had to deal in the Thames they touched record figures. The year 1915 was up to that time a record year in that respect, but it was beaten last year when the volume discharged at Teddington was far greater, and surpassed anything that had been known since the records had been kept. That excessive flow was no thought largely accounted for by the fact that the soil was already heavily charged with moisture, it had the effect of increasing the flow at Teddington were from 1,600 to 6,250 million gallons. What was going to happen in the future he did not know. Some time ago Sir Norman Lockyer suggested that rainfall and drought ran in decennial cycles. There was no doubt that cycles of wet years ran down to a minimum, and then climbed to a maximum. They might have to face a drought, but he did not think it was possible that they could go on with these extraordinary rainfalls for many more years. The total flow of water at Teddington last year reached the colossal figure of 574,057 million gallons.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Are not the reports of the meetings in the January issue of the *Journal* of the Institution of Municipal and County Engineers rather belated when we find that these reports are of meetings which took place in September of last year? Is there much benefit to be derived from such reports, which were duly published in certain professional journals directly after the meetings had been held?

* * * *

Was it not rather disappointing to find in last Sunday's *Observer* that the leading article, which was headed in large letters "DOWN WITH THE DUST," did not refer to some improved method of street cleansing, but merely to the new War Loan?

* * * *

Will the Cornwall County Council be able to persuade "the authorities" to let them employ German prisoners in their road stone quarries in order to free men for other work? If this council is successful in their appeal, is it not to be hoped that other local authorities will follow their example? Would not the prisoners themselves be only too glad to be employed in useful work, and thus find relief from the terrible monotony of idleness?

* * * *

It, as stated in the public Press, the Northampton County Council are confronted with an estimated expenditure of £200,000 on road works after the war, what is the estimated total amount which will be required throughout the United Kingdom to put our sadly neglected roads in order after peace has been declared?

* * * *

Are not the "suggestions for the preparation of specifications for concrete roads," which appears in this month's issue of *Concrete and Constructional Engineering*, exceptionally good? If the details there set forth could be scrupulously followed, ought we not to find that good concrete roads can be properly constructed in this country as well as in America?

* * * *

Was not the article in the *Architects' and Builders' Journal* of the 3rd inst., entitled "A Forgotten Town Planning Scheme for Westminster," an object-lesson to the present generation of how an excellent scheme by an engineer or an architect may be muddled and spoilt by officialdom? Does it not seem grievous to contemplate that the sad-looking Victoria-street might have been a magnificent boulevard, practically bringing St. James's Park into touch with it, and that all this was spoilt because the Government of that day insisted on building the hideous Wellington Barracks where they did?

* * * *

Does it not seem as if there is "something wrong somewhere" when we find that, although there is a shortage of labour for growing vegetables and other foodstuffs, a gang of men are taking up and relaying turf in Battersea Park, and this on a part of the park where the public are not allowed to walk?

* * * *

Where do the people of Tintern Parva and Chapel Hill, in the rural district of Chepstow, now obtain their water? Is it not evident from the report given of a recent meeting of the rural district council that there must be something very wrong indeed with that supply when we find that a school at Tintern Parva was without any water supply whatever, and "that the matter had been under discussion for five years"? Is it not rather astonishing to find in many rural districts an entire absence of any appreciation of that wise adage, "Penny wise and pound foolish"? And does it not make us wonder sometimes whether the promotion of parish councils was a wise measure?

* * * *

May the writer of these paragraphs be permitted to draw attention to a printer's error in his first paragraph of last week with reference to the manner in which Nature is always trying to override and efface man's handiwork? In referring to the wild flowers, weeds and grasses which spring up like magic on sites of old buildings, it is stated, "Where do the *woods* come from?" The word should, of course, have been *seeds*.

Experiences in Water Filtration.*

By H. G. HUNTER, M.CAN.SOC.C.E., Resident Engineer in Montreal for the New York Continental Jewell Filtration Company.

Rapid sand filters is a generic term implying two essential types of filters, the gravity and the pressure. The gravity filter is one wherein the water is passed through the filtering medium by the force of gravity. Such filters are contained in open tanks, and the raw water always passes through a coagulating period before reaching the filter. The pressure filter is enclosed in a steel tank, and operates under pressure. The arrangement of the underdraining systems is quite similar in both types of filters, and each has a bed of filtering material of about the same kind and depth of sand. The chief difference is, as before stated, in that one operates under pressure and the other by gravity. The pressure filter requires less space than the gravity filter, and is particularly applicable in certain cases where it is desired to avoid double pumping of the water, the filter then forming a part of the continuous piping system between the raw water pumps and the distribution system.

The gravity filter is of far wider usage, since it appears to be somewhat better suited to all-round conditions; but it must not be forgotten that there are numerous cases where the pressure filter will prove distinctly better.

PREPARATORY TREATMENT OF WATER FOR FILTRATION.

In preparing raw water for gravity filtration it is always essential that it first be freed of a substantial percentage of the impurities it contains in order not to unnecessarily overload the filter, and thus unnecessarily decrease its reserve capacity and increase the cost of its operation. This preparatory treatment may be effected by long storage, whereby the suspended matters are separated out of the water by sedimentation, or by coagulation and sedimentation, in relatively small basins. The latter procedure is the one most commonly followed, since its effect is quicker and far more thorough, and its cost far less.

In the preparatory treatment last mentioned an iron or aluminum salt is used as a coagulant, and sometimes a mixed salt of these two bases.

In Canada sulphate of alumina is used chiefly. The action which is brought about by adding the aluminum salt to water was discovered thousands of years ago in China, and results in the release in the water of a flocculent, neutral hydrate of aluminum, which attracts and enmeshes the suspended and colouring matters in the water, including the bacteria, and thus forms relatively large aggregates, which settle out rapidly in basins designed for that purpose. Such of the coagulated matter as passes the coagulating and settling basin is strained out by the filters, and a clear and colourless filtered water results.

The basins in which the raw water is prepared for filtration are of various types. Some are rectangular in plan, some square, some circular, their shape and size depending chiefly upon the character and volume of the water to be treated, and sometimes upon the topographical conditions met with.

The design embodies well-known and essential features. First, the basin is divided into two compartments, so that one half may be cleaned while the other is in use. It is important that the water enter the basin evenly throughout its width, and we find that to deliver the water at or near the surface is good practice. The effluent should be taken from near the surface and evenly over the width of the basin. In a straight-flow basin it is not found that baffles are necessary, other than that it is well to arrange to stop a "short cut" surface flow with a baffle near the inlet end.

In other basins where baffles are used, sudden and violent fluctuations in velocity of flow are avoided so far as possible, in order to prevent the breaking up of the forming coagula. Baffles are advisedly placed here and there in these basins to prevent the undesirable short-circuiting, and the cross-sections of the passages under and around these baffles are computed to a considerable degree of nicety in order to avoid sudden increases in the velocity of flow, which would not only tend to break up the forming floes of hydrate, but sweep along with the flowing current matters already brought to rest on the bottom of the basin.

It is necessary to have drains of ample size from a sump in the basin, and gates on these located in a dry chamber. There should also be arranged an overflow of adequate dimensions. It is very convenient to provide water under pressure, inside of the basin, where a hose may be attached for washing out the deposits. In this climate the basins must be decked over and covered with earth to prevent freezing, which necessitates manholes properly located for access and lighting.

APPLICATION OF COAGULANT SOLUTIONS.

No department of the purification process is more important than that wherein the coagulant solutions are applied to the raw water as it enters the coagulating and settling basins. As the character of the raw water changes, the dose of coagulant must be changed accordingly, and unless this is done intelligently, not only are poor filtration results to be anticipated, but a material waste of coagulant is unavoidable. This coagulant costs money. Probably all of one-third of the cost of operation of a filter plant is represented by the cost of the coagulant. Insufficient coagulant means poor results, and too much coagulant means unnecessary waste. If the filtration result is unsatisfactory through the use of insufficient coagulant, its cost has been largely thrown away, since no better than a poor result has come from its employment.

Where the devices for preparing coagulant solutions and the application of the same are clumsy, primitive, or require a great deal of manual attention, the dose is liable to fluctuate sharply from time to time. This means alternate under and over dosing, which runs into considerable waste money. Our company has centered a fair share of the efforts of its designing staff on endeavours directed specifically to the perfection of appliances whereby the preparation and application of coagulant may be made substantially automatic and fool proof, and where a constant known quantity of solution can be fed, and the quantity conveniently and quickly changed as desired.

There must be arranged in the plant a chemical storage room, chemical solution tanks, and chemical feeding devices. The storage room should be arranged for convenience in getting material into it and in moving the material. The solution tanks, if possible, should be arranged so that the top of the tanks comes at the level of the storage room floor. There should be two solution tanks. The capacity of one of these tanks should be figured to suffice for at least twelve hours' supply, under the maximum quantity of solution needed. The tanks are arranged with dissolving racks, in which the sulphate of alumina is placed, spray pipes for directing the water on to it, and agitators for keeping the solution agitated and of uniform strength. Various arrangements for these solution tanks are satisfactory, and from experience I would avoid only agitators operated from counter shaft, where belting and gearing is required. It is doubtful if it is good practice to use electric motors for driving the agitators. A water-motor driven agitator for each tank is in every way a satisfactory arrangement. Where concrete tanks are used, some arrangement for protecting the concrete must be provided. A solution of sulphate of aluminum will attack concrete, and in a short time eat away the surface of the concrete to a considerable extent. Present experience indicates that if the surface of the concrete, when dry, is treated with creosote oil and "Barrett specification pitch," it will remain unimpaired for years.

The piping from a solution tank will, of course, provide for drainage and also for taking the solution from the tank to the chemical feeding devices. The solution on passing from the tank should be filtered. This filter should have an area, so that the rate of filtration will be about 1·66 imperial gallons per square foot per minute. It may be arranged in the bottom of the solution tank or outside of the tank. Provision to wash back with clean water must be made. The filtering material is gravel, ranging in size from ¼ in. to 1 in. and the thickness of the material from 4 in. to 6 in. This [illegible] for filtering alum is most important, particularly as

* From paper read before the Canadian Society of Civil Engineers.

the small plants, and has been brought about entirely through experience.

The measuring devices for feeding the coagulant solution after filtering can be any arrangement whereby a constant known quantity of solution can be fed, and by which this quantity can be conveniently and quickly changed. The solution from the feeding devices can be conducted to the point of application in lead pipe, or chemical hose, either by pumping, so as to feed by gravity, or through a pump suction box to feed to the suction of the low-lift pumps.

CONSTRUCTION OF THE FILTER PROPER.

The rate of filtration adopted for mechanical filters is 104,000,000 imperial gallons per acre per day, or 1·66 gallons per square foot per minute. The general arrangement of modern filters is well known. The filter shell is usually made of reinforced concrete, rectangular in shape, and 7 ft. or 8 ft. deep. It is equipped with a strainer system at the bottom, about 36 in. of filter sand and gravel, and wash-water gutters at the top. Outside of the filter in the pipe gallery are located the pipes and valves for operating the filter.

The strainer system may be the combined or separate air system. On the design of the strainer system largely depends the uniform rate of filtration. This is so for two reasons—first, it must collect the water passing through the sand in uniform quantities over the whole area of the bed; secondly, it must distribute the wash water at a uniform rate over the whole bed. The distribution of the wash water is the most important detail to have correct in the filter. If this is defective, or the waterways are too small, the washing of the bed is not uniform, and in a short time there will be alternate areas of clean and dirty sand.

The design of a strainer system for a bed having an area of 150 sq. ft., or less, should not be used for a bed of greater area—that is to say, a central manifold casting from which lateral pipes branch each way to the sides of the bed can be supplied with water from one end, while in beds of greater area the manifold pipe should receive its supply at the centre, or in very large beds, at two points. It is probable that a bed having an area of 420 sq. ft., which would equal a million imperial gallon unit, should be designed with a manifold at each side and the lateral pipes laid between them, thus effecting a pipe system without dead ends. The manifold and lateral pipes should be of cast iron. In filters of small area, however, genuine wrought-iron pipe is used for laterals.

The strainer caps or strainer heads, sometimes called sand valves, are of numerous and widely varying designs. Many of them are covered by patents. They are made of brass or bronze, and so designed that the flow of water through them is broken up and equally distributed. Where the combined air and wash-water system is used a brass trap tube is usually required.

CARE IN PLACING STRAINERS.

The placing of the strainer system in the bottom of the filter should be done with great care, particularly if the combined system is used. It is very important that the strainer caps be practically level throughout the area of the bed, and a variation of over ½ in. is not permissible. Strainer caps should be spaced not more than 6 in. on centres. After the strainer system is in place, the whole should be embedded in lean concrete and the surface finished off with a layer of good cement mortar about ½-in. thick. This surface should be brought level with the lowest waterway to the strainer head.

Nine inches of properly graded gravel placed in the bottom of the bed is apparently sufficient. This gravel should be graded in size from ⅛ in. to ¼ in. On top of this 27 in. of carefully selected silica sand should be placed. The grading and the size of the sand is important from an economical point of view. If a sand not properly graded—that is, containing too large a percentage of fine particles—is used, the fine particles will eventually be washed out, and it will be necessary to replace the material so lost. On the other hand, if the size of the sand is not larger than ·60 millimetre, and smaller than ·37 millimetre, with a uniformity coefficient of 1·65, practically no waste will occur from fine particles being washed away.

Wash-water gutters are constructed of concrete, cast iron, steel and wood. The writer's experience has been with cast-iron gutters, and they have been found satisfactory. The top edges of the gutters should be placed to a straight line, so as to permit the lip of all the gutters in the bed to be set at one level. The distance above the surface of the sand at which these gutters should be placed depends upon what the rate of application of wash water is to be. If filter-washing is to be aided by compressed-air agitation, then a vertical rise of wash water of 13 in. per minute will suffice. If no air is used, but dependence laid upon what is known as the "high velocity wash," as used at Cincinnati, Ohio, and elsewhere, then a vertical rise of wash water of 30 in. per minute is not uncommon. Naturally, the whole sand bed is floated when wash water is forced upwards through it, and the higher the velocity of upward flow of this water the higher the sand layer will rise. Consequently, to avoid loss of sand, the wash-water gutters must be placed sufficiently high so that, whatever rate of application of water is employed, the filter sand will not be washed out of the tank and so lost. The capacity of the gutter should be such as to carry off the flow when running within 1½ in. of full. It is important that the drain be so laid that air will not trap and cause a back-flow.

WASH WATER AND AIR APPLICATION DEVICES.

The washing of the bed by first applying air to agitate the sand and then the water can successfully be done with a quantity of water that will equal a vertical rise of 13 in. per minute. In filter beds where air is not used for agitating the sand, but where revolving rakes are used for agitating, a vertical rise of 12 in. per minute is sufficient.

Air for agitating the sand previous to washing should be supplied under a pressure of from 3½ lb. to 4 lb. per square inch. The quantity of air should be not less than 3 cub. ft. of free air per square foot per minute. A proper wash of a filter bed is often accomplished by agitating with air for two minutes and washing with water for four minutes.

Where air and water is adopted to wash filters, the wash water and air agitating equipment must be arranged to meet conditions. On small plants—that is, beds having an area of 65 sq. ft. or less—the wash water may be obtained direct from the mains without dropping the pressure too much to cause annoyance. On plants larger than this and up to filters having a capacity of 1,000,000 gallons, a wash-water pump is usually used. This pump should have sufficient capacity to furnish the required amount of wash water, and be able to lift this water against a head equal to 16 ft. above the lip of the gutter. The most convenient power to drive the pump is electricity, and where electricity is used the starting device should be installed at a convenient point on the operating floor. Where units of 1,000,000 gallons capacity or more are used, and particularly in plants of 10,000,000 gallons or greater capacity, it is probable that a wash-water tower will work out to be more economical in operation and more efficient in service. The capacity of a wash-water tank should be sufficient to wash one quarter of the filter units in succession. The storage capacity necessary for this quantity of water should be above a point 16 ft. above the lip of the gutter. In connection with the storage tank there should be a regulating tank, or regulating device, that will drop the pressure of the water above the 16-ft. level to 16 ft., and maintain it at this level. Another factor that may work in and make a wash-water tank desirable is the load that can be thrown on to the power available. A centrifugal wash-water pump for 1,000,000-gallon unit will usually require a 50-h.p. motor. This load of 50 h.p. may be thrown on at any time during the day for a matter of four or five minutes. When using a wash-water tank a very small pump and motor is required. This pump and motor should have a capacity to restore in six hours the amount of water estimated for washing. This pump is started and stopped automatically by the pressure of water in the wash-water tower, or by a float. Filtered water should always be used for washing.

The air for agitating in all plants up to 1,000,000-gallons capacity may be supplied direct from a rotary blower. Electric current is the most convenient for the motive power. The blower should deliver the air against a pressure of 3½ lb. to 4 lb. A blower of sufficient capacity to agitate a 1,000,000-gallon unit will require practically a 50-h.p. motor, and it may be, as stated above, that the available power will not permit of throwing as great a load as this on to the power. In connection with the wash-water tower an air-storage tank can be arranged. This tank is simply an inverted tank, similar to the arrangement for a gasometer, in the wash-water tower. The air is supplied to this tank by rotary blowers of small capacity, working the same as the smaller wash-water pumps. The storage capacity should be for

sufficient air to wash one quarter of the filters in succession. The required air pressure is easily obtained by loading the tank with concrete.

A combined wash water and air tank, as described above, is used at the Montreal Water and Power Company's plant. In fact, this was the first combined air and wash water tank ever constructed, and the outfit as installed is satisfactory.

STERILISATION OF THE EFFLUENT.

Almost every filter plant in operation to-day is treating the filtered effluent with a sterilising agent, hypochlorite of lime, or liquid chlorine being used. Hypochlorite of lime, however, is being replaced by the use of liquid chlorine. There are liquid chlorine feeding devices on the market which are operating satisfactorily. The author's experience has been altogether with the Wallace and Tiernan chlorinators. Their solution feed machines are entirely satisfactory, and for small plants the machine operating with a pulsating motor is particularly satisfactory. The feeding of chlorine gas to the effluent passing from the filter plant, proportional to the amount of water flowing, is a problem requiring a good deal of study. There is no question but what the ideal way to chlorinate would be to chlorinate the effluent from each filter, or to collect the effluent of all the filters into a comparatively small area and chlorinate the water as it passes to the storage in the clear-water basin. Any such arrangement as this, however, runs into so many complications that it does not seem feasible. Where a Venturi meter can be arranged on the discharge line from the high-service pumps, the velocity head through the motor can be used for operating the chlorinator, and the chlorine solution fed to the suction of the pumps. Where such a meter cannot be arranged, a special Venturi tube can be installed at the outlet of the clear-water basin, and the velocity head at the throat utilised, feeding the solution through a distributing pipe, directly in front of the outlet. It is, however, important, and much to be preferred, that an automatic proportional feed machine be used on plants of large capacity. On smaller plants satisfactory results can be obtained with manual-control machines.

Workmen's Houses for Dunbar.—The Town Council of Dunbar have decided to inquire into the question of securing sites for workmen's houses.

Municipalities and Housing. — Dr. D. Axwell Williamson, medical officer of health for Edinburgh, speaking at the Labour housing conference at Glasgow recently, said the authorities were only wasting air on the housing question. No solution need be looked for through the operation of private enterprise. Housing schemes should be undertaken by municipalities with financial assistance from the Government. Much greater control over land in and around cities should be vested in the municipalities for that purpose.

RESTRICTIONS ON MUNICIPAL EXPENDITURE.

OVERCOMING A DIFFICULTY AT SURBITON.

An illustration of the difficulties which are being experienced by public bodies at the present time in obtaining official sanction to expenditure on even the most necessary matters is afforded by a discussion which took place at the last meeting of the Surbiton, Surrey, Urban District Council.

The Sanitary Committee presented a report of the proceedings at a special meeting held to consider further the proposed purchase of electrically propelled vehicles for the collection of house refuse in the district.

The clerk (says the *Surrey Comet*) reported that Sir John Snell, with the surveyor and himself, attended at the offices of the Local Government Board, and urged the necessity of the council being permitted to purchase two electrically propelled vehicles for the collection of house refuse, and to pay for them by instalments spread over three years. The board's representative said it would be necessary for them to consult with the Treasury, and that formal application should be made by the council in writing, setting out the details. This application had accordingly been prepared and forwarded to the Local Government Board. It was also reported that the sanction of the Ministry of Munitions would also be required for the manufacture and delivery of the vehicles, and Sir John Snell had assisted in drawing up an application to them in this behalf. The clerk further reported that, in his opinion, the committee must consider the possibility of the board refusing the application, as it was quite apparent from the interview that they were unwilling to grant any application of this nature at the present time.

After considerable discussion the committee came to the conclusion that if the Local Government Board, or the Treasury, were to refuse their sanction to the proposed purchase of two vehicles by means of instalments, the following alternative might be adopted—*i.e.*, to purchase one vehicle for cash this year, and, if possible, to hire a second vehicle for the period of one year, giving the makers an undertaking that such vehicle would be purchased by cash at the expiration of that period, or, in the event of the makers being unable or unwilling to lend a vehicle on hire, that the collection of house refuse should be done by one vehicle purchased for cash, with hired horses and carts.

From the figures placed before the committee by the clerk, it appeared that the financial effect of this arrangement would ultimately be more economical than the purchase of two vehicles by instalments, but in the first and second years the cost might be slightly higher, though this would depend largely on the terms upon which an electric vehicle could be hired. In any event the difference would not be large enough to require any increase in the rates, beyond such increase as would be required if two vehicles were purchased by instalments. If the course suggested was adopted the sanction of the Local Government Board or the Treasury would not be required, although the permission of the Ministry of Munitions would still be necessary.

It was mentioned that, as the council would soon have to consider the question of renewing the dust-removal contract, the committee thought it wise to have an alternative scheme ready, in case their original scheme did not go through.

The chairman said he understood that the makers of the vehicles were quite agreeable to the council purchasing one and hiring another. The cost of hire for one year would be £60. Either of the alternative schemes was good, providing the original scheme did not go through.

Mr. Packham asked if the £60 paid for hire would be taken off the purchase price.

The chairman: No; it represents 6 per cent interest on the outlay.

Mr. Willcocks asked whether a careful and conservative estimate had been made as to the cost of this new departure.

Mr. Kavanagh replied in the affirmative. Everything that could be thought of, with the exception of insuring the vehicles, had been done. Properly worked, he had no hesitation in saying the new dust-removal scheme would be a success.

In reply to Mr. Willcocks, the chairman said it was hoped to acquire the new vehicles without raising the rates.

Mr. Shaw expressed the fear that the purchase-money would find its way out of the country, but sug-

informed that they had the assurance that the manufacturers were an English firm.

In the end the following recommendations, submitted by the committee but slightly modified by the Council, were adopted: "That, in the event of the Local Government Board or the Treasury refusing to sanction the purchase of two electric dust vans by means of instalments spread over a period of three years, the council purchase one electric dust van this year, that the Surveyor's Committee be authorised to give Edison Accumulators, Limited, an order to proceed forthwith with the manufacture of one electric dust van, and to inform them that if the council do not obtain the sanction of the Local Government Board to purchase the vehicle by instalments, the council will purchase one vehicle for cash, and take another electric van on hire for the period of twelve months, from April 1st next, upon the understanding that the council will purchase the vehicle for the sum named in the specification at the expiration of the twelve months."

THE DESIGN AND COST OF RESERVOIRS.

To the Editor of THE SURVEYOR.

SIR,—I have read with interest the letter signed "Water" which appeared in your issue of the 29th ultimo criticising the paper which was recently read by Mr. Binnie before the Institution of Water Engineers on the Cross Hill service reservoir, which is being constructed for the Birkenhead Corporation.

As an old pupil of the late Dr. G. F. Deacon, I am in agreement with "Water" in admiring his work, which was always bold and original, and as resident engineer on this scheme I am glad to have the privilege of carrying out work designed by Messrs. Sir Alex. Binnie, Son & Deacon, which is in some respects as original as any of Dr. Deacon's designs.

The criticisms are chiefly directed towards showing that the work could have been otherwise designed so as to be cheaper, and the writer of the letter affirms that Mr. Priestley was on solid ground when he stated in the discussion which took place that the roofing of such reservoirs added 50 per cent to the cost.

Now, the actual facts are that the entire roof of the reservoir, including the pillars which support it, cost less than 25 per cent of the total expenditure.

It is obvious that the roof can be designed so as to add to the stability of the side walls, as the overturning moment when the reservoir is empty, due to the embankment behind the side walls, can be taken almost to zero, and it was brought out in the paper how full advantage was taken of this fact to economise material in the design of the side walls.

I stated in the discussion that the economy was so great that the addition of the roof did not, in fact, increase the cost of construction, and in making that assertion I assumed that, owing to the large radius for a reservoir of this capacity, it would not be necessary to use the horizontal arch for any increase in stability.

"Water" further criticises the roof because of its ornamental character and appears to suggest that appearance, and not economy, was considered in its design. He gives, however, the cost of a flat reinforced concrete roof to cover a circular reservoir of similar area as being £21,000. As the actual roof cost considerably less than that figure, it is difficult to see what advantage could have been obtained in adopting that form of construction, and it must be borne in mind that the roof is an essential part of the design of the reservoir, in addition to the stability of the side walls, as already explained.

"Water" further suggests that the reservoir could have been more cheaply designed if made circular in plan, and gives an estimate of the cost of a circular reservoir of equal capacity to establish this contention. Now, in order to compare the cost of the two designs, the same unit prices should be adopted in each case. In many cases, however, the unit prices which "Water" adopts are far below what were actually paid. The concrete on the floor, which he puts at 2s. 6d. per cubic yard, actually cost 5s., the concrete which he places at 22s. and 25s. per cub. yard, was actually paid 26s. and 28s. similarly, the setting and straining and the drainage, for which he puts down the sum of £925 and £1,000 respectively, actually cost considerably more. All round his unit prices, the cost of a circular reservoir works out at £69,000, but, taking the actual rates paid at Cross Hill, the £69,000 is increased to about £85,000, as against £73,000, the cost of the actual reservoir, and it is therefore apparent that the structure as designed is more economical than a circular reservoir.

"Water" raises questions as to expansion joints in the walls, and also as to asphalting the whole of the roof. Mr. Binnie dealt with these points in the paper, and explained the arrangements designed for localising and dealing with temperature cracks if they occur in the walls, and the provision made to locate temperature cracks at the groins, and how such cracks are dealt with so that there is no leakage.

The figures of the costs of reservoirs quoted by "Water" are interesting, but such comparisons must only be applied when the local conditions are similar. One of the main factors which enters into the question of the cost of these works is the facility for getting materials to the site.

I must apologise for taking up so much of your valuable space with this letter, but some of the points raised by "Water" appeared likely to mislead if they remained unchallenged.—Yours, &c.,

R. F. BAKER.

Resident Engineer's Office,
Barnston,
Birkenhead.
January 8, 1917.

To the Editor of THE SURVEYOR.

SIR,—The writer wishes to point out two printer's errors in his letter in your issue of the 29th ult.—viz., "J. F. Deacon" should be "G. F. Deacon," and "slim roof" should be "thin roof."

With regard to Mr. Dixon's letter, the writer quite appreciates his irony. As Mr. Dixon suggests, the writer is an obscure individual, but he holds the view that scientific institutions entirely fail in their purpose when they become mutual admiration centres, and he has, accordingly, ventured to put forward a few facts relating to reservoirs.

Mr. Dixon rightly praises the description of the work, but he abstains from giving his reasoned views on some of the fundamental considerations.

With reference to Mr. Dixon's last paragraph, the writer instanced a recent estimate of £1,900 per 1,000,000 gallons for an open masonry reservoir on a hard rock site, and Mr. Dixon is no doubt aware that the two largest masonry reservoirs in this country—Long Newton and Frankley—were constructed for very considerably less than that figure, although they are not circular, and they have dividing walls of the full depth.

In view of this, Mr. Dixon's remark "that the cost of the covered reservoir (£2,625 per 1,000,000 gallons) justifies its adoption," is not quite clear.

It is interesting to note that in "The American Civil Engineer's Pocket-book" (1911), p. 951, Mr. Allen Hazen, one of the ablest living hydraulic engineers, gives the following:—

COST OF COVERED MASONRY RESERVOIRS.

	£ per million gallons.
Small reservoirs and reservoirs on difficult sites	3,750—5,000
Large reservoirs and reservoirs on favourable sites	1,750—2,000
Common figures are	2,500—3,000

COST OF OPEN DISTRIBUTING RESERVOIRS.

Common cost	625—2,500
Common figure for a medium-sized reservoir on a favourable site	1,000

As a recent example of a large open concrete reservoir with gravity retaining wall, we have the Rochester reservoir, completed in 1908 (consultant, the well-known engineer, F. P. Stearns); capacity, 120,000,000 gallons; cost per 1,000,000 gallons gross capacity, £880. This is an oblong reservoir, on a favourable site (*Engineering News*, October 27, 1910).

Briefly, Mr. Binnie appears to contend as follows:—

	£ per million gallons.
Cost of ordinary masonry covered reservoir...	5,000
Cost of Cross Hill reservoir	2,625
Cost of masonry uncovered reservoir ...	2,625 +

The writer contends as follows:—

Cost of ordinary masonry covered reservoir, about	2,450
Cost of ordinary masonry uncovered reservoir ,,	1,650

(All figures relate to the Cross Hill site in 1913.)

—Yours, &c.,

WATER.

January 15, 1917.

THE METRIC SYSTEM.

To the Editor of THE SURVEYOR.

SIR,—My attention has been attracted by your article on the metric system in your issue of the 12th inst. As pointed out by me in your issue dated October 13, 1916, p. 330, we already possess a native metric system and decimal coinage, and need no other. No other system, indeed, can ever be an improvement.

Our teaching of British weights and measures and currency is bad. We mix up the units, and produce an artificial and unnecessary confusion. Until this is remedied the system will always present undue difficulty to students. Unfortunately, national education is largely controlled by decimal or metric advocates, and in their enthusiasm they cannot think in anything but tens, much in the same manner that a cobbler thinks there is "nothing like leather."

There is nothing to prevent, in wholesale and foreign trade, in all calculations and paper checks, and in accounts, the immediate use of—

(*a*) Tons, sacks, and decimals of sacks.
(*b*) Metres of $1\frac{1}{10}$ yards, and decimals of metres.
(*c*) Pounds sterling, florins, and decimals of florins.

It is unnecessary to disturb any person employing pounds avoirdupois, shillings, pennies, and farthings, or yards, feet and inches. There is no system so democratic as the British, because it helps equally the poor with the rich, the manual with the brain worker, retail with wholesale trade, the customer with the dealer, decimal as well as vulgar fractions.

As regards our coinage being decimal, we can consider the florin as divided into 100 cents of account (not coined). Then—

The shilling = 50 cents.
The sixpenny-piece = 25 cents.
The threepenny-bit = $12\frac{1}{2}$ cents.

And the threepenny-bit (the practical limit in wholesale trade, if quotations are made by the British kilogram of 2·24 lb.) is, for the practical convenience of retailers, the proletariat, and the middle class consumed, subdivided into 3 pennies, or 12 farthings, instead of a very awkward and unpractical $12\frac{1}{2}$ parts. A coined cent in our currency would be an incumbrance and hindrance.—Yours, &c.,

E. A. W. PHILLIPS, M.INST.C.E.

Hove.
January 12, 1917.

AN ALDERMAN'S RIGHTS.

IMPORTANT DECISION IN THE KING'S BENCH.

A Divisional Court of the King's Bench, consisting of the Lord Chief Justice and Justices Ridley and Lush, was on Monday asked to decide whether or not a member of a municipal body is entitled to exercise his right to inspect and make copies of documents relating to matters of local administration with the view presumably of assisting a ratepayer in possible litigation with the municipal authority. The action was brought by Alderman Woodward, of the Hampstead Borough Council, and the matter arose out of a closing order made in respect of 83 Palmerston-road, owned by a Mr. Arlidge. Mr. Woodward had taken up the position that he might properly assist Mr. Arlidge. The question was, however, whether in so doing he had not so far identified himself with Mr. Arlidge's case as to make it undesirable that documents such as those referred to should be disclosed to him, the probability being that they would be used by and on behalf of Mr. Arlidge in his pending litigation with the council.

Mr. Macmorran, K.C., and Mr. Sydney G. Turner appeared for the borough council, and Mr. Clavell Salter, K.C., and Mr. Brooke-Little for Mr. Woodward.

The Lord Chief Justice, in giving judgment, said the question involved was only a question of fact. *Primâ facie*, Mr. Woodward had the common law right to the production of the documents. It was contended, however, that Mr. Woodward required to see the documents for the purpose of assisting Mr. Arlidge in litigation with the borough council. On the facts he had no hesitation in coming to the conclusion that Mr. Woodward's proceedings in the matter were not dictated solely by the public interest. In these circumstances the Court ought to refuse to exercise its discretion in favour of Mr. Woodward by ordering the council to produce the documents. The rule would be discharged. Justices Ridley and Lush agreed.

NOTES FROM IRELAND.

SPECIALLY CONTRIBUTED BY AN IRISH CORRESPONDENT

[In the hope of making these notes as practically useful as possible the writer invites readers to favour him with communications thereon from time to time. They might be constructively critical, or helpfully supplementary, might indicate new points upon which information is desired, or might merely convey information. Communications will reach the writer if addressed "Irish Notes," 24 Bride-lane, Fleet-street, E.C.]

Institution Meetings.

Municipal and county engineers in Ireland are at a great disadvantage as compared with their fellow engineers in England and Scotland, owing to the few opportunities afforded in the country for visiting works in progress and for discussing subjects dealing specially with municipal and county work. Some twenty years ago the meetings of the Irish branch of the Institution of Municipal and County Engineers were well attended both by English and Irish members, and very successful meetings were held at Dublin, Belfast, Cork, and Derry, but after the passing of the Local Government Act in 1899 a number of county surveyors retired, and others became so engrossed in work, owing to the increased duties thrown on them, that it was found difficult to induce members to prepare papers for discussion or to attend meetings. In recent years a change has occurred in the Irish secretaryship, and Mr. Sellars, town surveyor of Dundalk, the new secretary, seems to have done his best to promote meetings; but the meetings held have been sparsely attended, and it is evident that greater inducements must be offered to members, both in the way of opportunities for inspecting important works in progress and in the preparation of interesting papers, in order to obtain a good attendance at meetings.

* * * *

One great drawback to the holding of district meetings in Ireland is the long distances many members would have to travel to the town selected for a meeting and the feeling that it would not pay to travel a long distance for a one-day meeting. Not long ago two road congresses held in Dublin in successive years proved very popular, and were well attended both by Irish and English surveyors, as well as by county and district councillors and the general public, but these congresses, of course, only dealt with subjects particularly connected with the construction and maintenance of roads and the traffic conveyed over them. It is to be regretted that, after the second of these congresses, steps were not taken to hold an annual congress dealing not only with roads, but also with the many other technical subjects with which municipal and county engineers are concerned. If the Roads Congress Committee, which the writer believes is still in existence, the County Surveyors Association of Ireland, and the Irish District branch of the Institution of Municipal and County Engineers would co-operate and arrange for the holding of, say, a three-days' congress at some important centre in Ireland each year for the purpose of discussing matters relating to county and municipal work, and for visiting works of interest, it would undoubtedly prove very successful. Possibly the Institution of Civil Engineers of Ireland, and other engineering societies, might be induced to take part in the congress, and this would add still further to its success. A congress of this kind would have it in its power to help materially in the advancement and prosperity of the country.

* * * *

Apathetic Councils.

There is in parts of Ireland a great lack of initiative and a disposition on the part of the general public to let things alone in the matter of town improvements, water supply, sanitation, and so forth. The result is that municipal work in many of the smaller towns is in a very backward state, and some of the towns, instead of increasing in prosperity from year to year, show signs of further decay with a declining population. All these towns have their town surveyors, and the rural district councils have usually their own appointed engineer or surveyor, but owing to the apathy of many of these councils these men can do little to improve the condition of their towns and districts. The holding of a large congress annually, however, in central places in the country and the discussion of matters relating to road maintenance, water supply, sanitary work and cognate

subjects would attract attention, and the proceedings would no doubt be fully reported in the public Press. Local councillors and other visitors could also be invited to take part in the proceedings, and the result would be a desire on the part of many of those taking part in the congress, and reading the papers discussed, to try and advance some of the reforms and improved methods advocated in their own district.

* * * *

A Suggested Congress.

The present time is perhaps not suitable for holding a congress, but it seems an excellent time to discuss the practicability of holding such a congress annually, and of appointing a committee to go fully into the question, and if the scheme is found feasible to draw up a report and preliminary programme. There should be no difficulty in calling a meeting to consider the proposal if the president of the last road congress, the chairman and secretary of the Irish District of Municipal and County Engineers, and the secretary of the County Surveyors' Association of Ireland would take up the matter. If it should be decided to hold a congress on the lines suggested, it should be quite possible to arrange that a meeting of the Irish District of the Institution of Municipal and County Engineers should constitute the first day's proceedings. At this meeting the more technical papers dealing with the work of municipal and county engineers could be discussed, while at the congress proper on the succeeding days papers of a more general and popular character could be dealt with.

* * * *

The assembling in congress of a large number of Irish councillors and surveyors, as well as many members of the general public in Ireland, besides visitors from England and Scotland, for the purpose of discussing the best means of improving their highways, as well as their water supplies, the sanitary condition of their towns and villages, and similar subjects, would assuredly be followed by good results. Will someone start the project?

SCOTTISH NOTES.

We propose to commence next week the publication of a "Scottish Notes" column.

THE FLY NUISANCE IN SOUTH AFRICA.

By C. E. Hall,

Chief Sanitary Inspector to the Bulawayo Municipality.*

In dealing with this nuisance, while it is possible for the council, with the co-operation of the residents, greatly to minimise it, I submit that the total elimination of the nuisance in Bulawayo is impossible. This will readily be understood when it is remembered that there are within the municipal area 2,300 night-soil pails and numbers of receptacles conserving dry and liquid refuse. These are essential to a town not having a drainage system, but at the same time attract flies and provide a feeding ground for them.

The installation of a drainage system would do much to lessen sanitary conditions in this town.

The department experimented with borax as a substitute for quicklime when disinfecting refuse pails after they had been scavenged, and I carefully watched the results. The refuse produced on the premises under observation included refuse from a [illegible] fruit and vegetable stores, hotels, restaurants, and business premises, and consequently of such a character as to provide an ideal breeding and feeding ground for flies. It was found that the borax did not compare with chloride of lime for general efficiency, and it was discontinued, and the use of chloride of lime again instituted.

The reason for the failure of borax is that the department can only disinfect a refuse bin at the time it has been scavenged, and the borax acts only on the contents it comes in contact with, consequently the refuse that is again deposited is not affected. Had the occupiers of these premises sprinkled the refuse each time it was before being deposited, the result might have been different.

The use of chloride of lime has this advantage over borax—namely, that after application of the lime gas is liberated, which gas rises through the refuse deposited, thereby destroying flies and maggots in the refuse, and at the same time acts as a "maggot killer."

A native is now employed whose duty is to clean out the rear portion of closets behind the riser of the seat, and then to sprinkle the chloride of lime. The appointment of this native on this work has minimised the filth nuisance of that portion of the closet that is not seen by the occupier.

While not deprecating the use of disinfectants, I am of the opinion that the best method of fighting the fly nuisance is on the following lines:—

(*a*) The proper conserving of refuse in fly and rain proof receptacles.

(*b*) The frequent removal of refuse at least once in seven days.

(*c*) The paving of stables and the provision of fly and rain proof manure middens.

(*d*) The enforcing of the council's sanitary regulations, with a view to ensuring a high standard of cleanliness.

* Extract from annual report.

A WELSH SURVEYOR'S "SALARY."

FOURPENCE A DAY!

The Narberth, Carmarthenshire, Urban District Council considered at their last meeting the resignation by Mr. W. G. Mathias of the post of surveyor. On being asked for his reasons for tendering his resignation (the *Welshman* reports) Mr. Mathias replied that they were three in number—viz.: (1) That the council did not advance him the necessary money to pay wages. He had to run over the town to borrow money with which to pay the wages. (2) The salary he received for doing all the work pertaining to the office of surveyor amounted to only 4d. a day, and there was a good bit of work to be done. (3) There was more trouble in carrying out the work of dealing with 1½ miles of streets than in dealing with 101 miles of roads in the rural district.

The clerk asked if the surveyor would let them know how many hours he worked for the council during the year as surveyor?

The surveyor replied he did not have his books there and could not tell them. He asked for an increase of wages when he started work for the council, and he was promised definitely that when the Housing and Town Planning survey was completed the matter would be considered, but nothing had been done.

Mr. Eynon said the appointments of sanitary inspector and surveyor were not separate appointments.

Mr. Henry Lewis said the difficulty connected with Mr. W. G. Mathias' first reason for resigning could easily be got over by getting the necessary cheques signed at the end of each meeting.

The clerk agreed that that could be done, and Mr. Lewis' suggestion was adopted.

The chairman then asked the surveyor what he had to say with regard to the wages question.

The surveyor replied that the council could afford to give him something more, as there was a lot of work and worry connected with the office.

The surveyor was asked to withdraw while the council considered the salary question in private, and on his return the chairman said the council had instructed him to ask him (the surveyor) to allow the wage question to stand over until after the war, when it would be duly considered. The council would deal honourably with him, and would no doubt accede to his request.

The surveyor replied that everything had gone up in price. He would agree to carry on the work until the end of the financial year, and he asked to be allowed a month to consider what they had asked him to do.

Mr. T. Williams (to the surveyor): Say you will drop the wage question until after the war.

The surveyor replied that everything had gone up.

Mr. Eynon said that everything had gone up for the ratepayers too.

The surveyor's request to be allowed a month to consider the council's suggestion was acceded to.

An Idle Refuse Destructor.—At the last meeting of East Grinstead Urban District Council, the surveyor, Mr. W. E. Woollam, reported that, in consequence of his men being called up for military service, he had been reluctantly compelled temporarily to shut down the refuse destructor, but the collection of house and trade refuse would go on as usual. It was hoped that householders would reduce the quantities of refuse as much as possible, and utilise all they could on their own gardens, and burn as much as was consumable of the rest.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars have reached us during the present week. Other reports will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Birmingham T.C.—Consideration is being given to the question of providing additional accommodation for the treatment of tuberculosis.

Burnley T.C.—The Carnegie Trust have offered a grant of £15,000 towards a central public library, the building of which, it is suggested, should be deferred till after the war.

Derbyshire C.C.—The Bridges and Highways Committee have been authorised to carry out works at the Eckington depot, at a cost not exceeding £200.

Hawick T.C.—The town council are seeking for sanction to a loan for the extension of the Anderson Sanatorium.

Leeds T.C.—It is proposed to adapt Fairfield House, Armley, as a training home for mentally defective women.

Surrey C.C.—Consideration has been given to renewed representations of the Richmond Town Council as to the inadequate and dangerous condition of Richmond Bridge, but the county council have decided not to move further in the matter during the war.

HOUSING AND TOWN PLANNING.

Burry Port U.D.C.—The council are applying to the Government for a grant of 20 per cent towards the cost of a town-planning scheme.

Camberwell B.C.—In view of the retirement in April of Mr. J. E. Burkmer, manager of the borough council's housing estates, it has been agreed to place the management of the properties in future under the control of the borough treasurer. The repairs to properties will in future be under the control of the borough engineer, and executed through his department.

Carshalton U.D.C.—The Local Government Board have asked the council to supply details of the proposed housing scheme, which is estimated to cost £20,000.

Dumbarton T.C.—A committee has been appointed to prepare a housing scheme to be put into operation when the time is opportune.

Dundee T.C.—It was announced last week that a proposition on housing would be submitted to the town council at an early date.

Wrexham R.D.C.—The engineer reported that he had prepared estimates of several housing schemes which it is intended to carry out after the war. The estimates are as follows: To complete scheme No. 1 at Rhos by the erection of forty-three houses, streets, £12,600; scheme No. 2, 100 houses at Broughton £30,000; scheme No. 3, sixty houses at Cefn, £18,000; scheme No. 4, sixty houses at Rhos, £18,000; total, £78,600. The engineer was instructed to proceed with the preliminary work of preparing plans and detailed estimates with a view to the council being in a position to carry out the schemes after the conclusion of the war, and also to obtain particulars of suitable building sites in the selected areas.

MOTOR TRANSPORT.

Ashton-under-Lyne T.C. — The Tramways Committee have agreed to purchase an electric tower wagon.

Barking U.D.C.—A small covered motor car is to be purchased for the use of the electricity department.

Bournemouth T.C.—The Local Government Board have refused to sanction at the present time an application by the town council for a loan of £1,200 for the purchase of a motor fire engine.

Clevedon U.D.C.—The council are considering the purchase of a motor fire engine.

Pontefract T.C.—The purchase of a 3-ton motor lorry is under consideration.

Sheffield T.C.—The corporation are recommended by the Health Committee to purchase five electric vehicles for refuse collection.

Surrey C.C.—The War Agricultural Committee have been authorised to purchase motor tractors and implements to let to farmers, at a cost not exceeding £2,000.

REFUSE COLLECTION AND DISPOSAL.

Bognor U.D.C.—It was reported that there were 475 houses not provided with proper dustbins, and the council decided to require the owners or occupiers to provide these within twenty-eight days from the service of the notice.

ROADS AND MATERIALS.

Ballymoney R.D.C.—It has been agreed to increase the Local Government Board statutory limit of road expenditure by £800 annually, and a proposition was also passed adopting direct labour in the rural district.

Barnstaple R.D.C.—The surveyor of highways, Mr. A. A. Richards, has been asked to report upon the coast road between Woolacombe and Mortehoe, which is said to be in danger of slipping into the sea.

Bideford R.D.C.—It has been agreed to pay contractors for manual labour, not included in their contracts, at the rate of 3s. per day (instead of 2s. 6d.), and for a man working with a horse 7s. per day. Some surprise was expressed at the receipt of a tender for road work from a man who had obtained conditional exemption under the Military Service Act as a farm bailiff. Another tender was accepted. In accepting the other tenders, regard was paid to the age and military classification of the contractors, as it was felt that would have some bearing upon their likelihood of being able to remain to carry out the work.

Cheriton U.D.C.—The council have referred to the Highways Committee a proposal by the Road Board, on behalf of the War Department, to widen Church-road West to 24 ft., constructing a pavement, fencing, and laying a sewer, at an estimated cost of £1,000, the board to carry out the scheme with their own labour. The Road Board, it was stated, would be prepared to consider an application for a loan for the council's contribution.

Chippenham T.C.—The borough surveyor, Mr. A. E. Adams, has been authorised to notify householders to remove snow from their forecourts, and to warn them that if they refused they would be reported to the town council.

Colchester T.C.—The Sub-Committee of the Roads and Drainage Committee reported that they had purchased a horse for £94.

Cornwall C.C.—The county surveyor, Mr. L. D. Thompson, has submitted an estimate of £59,811 for the financial year 1917-18. In this sum is included £800 for tar-spraying and grouting. It was reported that German prisoners would be available for quarrying and road work.

Falmouth T.C.—A letter has been received from the Local Government Board setting out amendments required in respect of the Swan Pool improvement scheme. The borough surveyor, Mr. H. E. Tresidder, stated that these amendments would cost about £2,000. It was agreed that inquiries should be made as to borrowing money to carry out the corporation scheme.

Gillingham (Kent) U.D.C.—Plans and estimates are being prepared of the proposed widening of Park-road, but it is not proposed to carry out the work till after the war.

Hailsham R.D.C.—An intimation has been received of the intention of the Road Board to contribute £720 towards the repair of the highways damaged by military traffic.

Surbiton U.D.C.—The council have been informed of the decision of the County Highways Committee to contribute one-third of the cost of carrying out an improvement in the Brighton main road where certain premises cause the footway to project into the carriageway.

Southmolton R.D.C.—It was reported by Mr. W. S. Gardner, one of the highway surveyors, that he

recently engaged two men whose rate of pay was not arranged. They had now sent in bills, and wanted to be paid 8s. 6d. a day. Both were good men. Suitable men could not be got for less in his district, because superior pay was obtainable for work in the woods. Mr. Jones: Farmers can't compete with 4s. 6d. a day. It was agreed to pay the bills.

SEWERAGE AND SEWAGE DISPOSAL.

Gillingham (Kent) U.D.C.—It has been decided to prepare plans and estimates for a sewerage scheme in Pier road which it is suggested could be put in hand after the war.

Holywell R.D.C.—The Holywell inspector has been instructed to present a report on the effect upon the rural district from a sanitary standpoint, of the stopping up of the flow of St. Winefride's Well. It was stated that eventually the stream down the valley would become dry and it was very important, in the interests of public health, that precautions should be taken.

Nuneaton T.C.—The town council are asking the Local Government Board for sanction to a loan for completing the conversion of the contact beds at Hartshill into filters. A proposal was also submitted to ask for sanction to a loan of £5,000 for the sewerage of the Coton-road district, but it was withdrawn with the explanation that Captain F. C. Cook (borough engineer) when home on furlough thought it would be best to postpone the work for various reasons.

Woking U.D.C.—Mr. G. Midgley Taylor submitted a report to the Drainage and Farm Committee on the Woking sewage disposal scheme. He enclosed a certificate for £521 in favour of Messrs. Hardy & Co., which left approximately 10 per cent retention on the value of works executed. The amount previously paid on the contract was £12,806. Mr. Taylor stated that no work authorised by the Ministry of Munitions was completed except the erection of the lime mixers, air compressor, sludge pumps, and new presses. The sludge pumps had been delivered, and the manufacture of the remaining machinery was well in hand. Messrs. Johnson, who had to erect the machinery, informed him that, even if all the machinery were delivered, there was little prospect of their being allowed to send an erector to Woking for some time.

WATER, GAS, AND ELECTRICITY.

Colchester T.C.—On the presentation of the Electricity Committee's report Alderman Barritt said the conditions under which current was now being generated and distributed were much more serious, and might become critical. He attributed this to the absence of the staff and remarked that they might have temporarily to suspend the supply of current. Mr. Wright suggested that the committee might send out a warning to the inhabitants to discontinue the use of high-voltage lamps, and use those of lower voltage.

Denby and Cumberworth U.D.C.—A scheme is being considered for the improvement of the water supply.

Hebburn U.D.C.—The deputy surveyor has received instructions to prepare an estimate of the cost of lighting the town by gas.

Louth T.C.—The improvement of the water supply has been referred to a sub-committee for consideration and report.

Newcastle (Co. Limerick) R.D.C.—The tender of the Newcastle West Electric Light Company has been accepted for the lighting of the town by electricity.

Newton Abbot U.D.C.—As the result of complaints about the restricted lighting the council have decided to light the main streets in the same way as the main streets of Torquay. It was stated that one lamp at Torquay gave as much light as twelve lamps at Newton Abbot, and that there was no economy in having the street lamps, as the current was being consumed just the same.

St. Andrews T.C.—Provost Aikman, reporting on the water of the Kennedy, said that Mr. James Watson Blackhall had stated that he had acquainted himself with many schemes in England, Scotland and Ireland, and he could truly say that St. Andrews had got the best water scheme (1,000,000 gallons) than any other he knew. The total expenditure for the water works at Cameron amounted to £43,371. The amount authorised to be borrowed was £41,050. It was agreed that the amount of the excess expenditure should be borrowed under the Burgh Police Acts, although this would entail repayment in a shorter period than if borrowed under the powers of the Provisional Orders.

Wellington R.D.C.—The council are asking for a Local Government Board inquiry into the question of the Hadley water supply. The cost of the supply has been guaranteed hitherto by a number of residents who now seek to be relieved of this responsibility.

Wolverhampton T.C.—It is proposed to effect an extension of the electricity main, at an estimated cost of £151.

MISCELLANEOUS.

Ashton-under-Lyne T.C.—A Bill will be prepared for the next Parliamentary session for the purchase of the Oldham, Ashton and Hyde Electric Tramway Company, and also to construct connecting tram lines.

Camberwell B.C.—Owing to the difficulty of obtaining grave-diggers, the Public Service Committee are engaging for the work excavators from the borough engineer's department at 9d. per hour. At the same time, it has been decided to pay the regular grave-diggers at the same rate, with time and a-half for all overtime worked, including Saturday afternoon.

Morpeth T.C.—Reference was made at the last meeting to the further erosion of the river banks at the entrance to the Castle Wood, and it was agreed that the borough surveyor, Mr. J. Davison, should inspect the banks and submit a detailed report as to the best means to prevent the further erosion, together with an estimate of the cost.

Portsmouth T.C.—A proposition for the enlargement of the town boundaries has been referred to the Finance Committee. The suggestion is to extend the boundaries as far as Purbrook on the north, Bedhampton on the east, and Portchester on the west, and develop on garden city lines.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

APPLICATIONS FOR LOANS.

Boston T.C.—£1,000 for refuse-crushing plant.

Heywood T.C.—£3,335 for the Botany sewage works.

Nuneaton T.C.—£1,300 for a water-softening plant, and £1,200 for new distributing mains.

LOAN SANCTIONED.

Sheffield T.C.—£8,280 for new electricity plant.

FORTHCOMING INQUIRY.

23. **Stoke-on-Trent.** For the purchase of a motor fire engine and equipment (Mr. P. M. Crosthwaite) ... ...

Women and Road Work.—Smaller barrows and lighter brooms are to be provided by the Guildford Council for women scavengers.

"Safety First" Suggestions.—At the first meeting of the London "Safety First" Council, held on Monday at Caxton Hall, Westminster, consideration was given to the following, among other matters: A colour scheme for street lamps, and coloured lighting for street refuges and obstructions; the production of an effective luminous paint, and more effective whitening mixture for kerbs, &c.; the standardising of the rule of the road for both vehicles and pedestrians, so that both should keep to the left; the issue of a white armlet for use at night-time by pedestrians.

Control of Agricultural Machinery.—An agricultural machinery branch has been set up in conjunction with the Board of Agriculture and the Food Controller to deal with the control of the manufacture of agricultural machinery and implements. It is intended to class the manufacture of all such machinery and implements as munitions work. An advisory committee of representatives of the agricultural machinery trade, to advise the branch generally, has been established, and the following gentlemen have consented to serve: Messrs. A. Bornemann (Ruston, Proctor & Co., Limited, Lincoln), R. H. Fowler (J. Fowler & Co., Leeds); W. Harrison (Harrison, Macgregor & Co., Leigh); J. Howard (G. & F. Howard, Bedford); L. C. Ransome (Ransomes, Sims & Jefferies, Ipswich); J. Segar (R. Hornsby & Sons, Limited, Grantham); with representatives of the Ministry of Munitions, the Board of Agriculture, and the Food Controller.

PERSONAL.

Mr. J. W. Doughty, chief inspector of Lincoln waterworks, has been appointed to a similar position under the Doncaster Corporation.

Mr. Robert Grieves, engineer and surveyor to the Blyth Urban District Council, has resigned after twenty-three years' service. He intends to retire into private life.

Mr. J. B. L. Meek, city surveyor's department, Manchester, has been transferred from the class of associate member to that of member of the Institution of Civil Engineers.

Gunner R. H. Oxtoby, son of the borough engineer of Camberwell, Mr. W. Oxtoby, M.INST.C.E., has been awarded the D.C.M. for distinguished conduct in the field, and the borough council have conveyed their heartiest congratulations to father and son.

Lieutenant A. W. Edmett, Royal West Kents, assistant surveyor to the Slough Urban District Council, who was wounded in the first advance on the Somme, and is still an inmate of Guy's Hospital, is reported to be making very satisfactory progress.

Captain M. E. Fitzgerald, highway surveyor to the Warmley Rural District Council, has been warmly congratulated by the council upon having been mentioned in Sir Douglas Haig's dispatch. The officers of the urban council associated themselves with the resolution passed by the members.

Mr. Edward Whitwell, the new president of the Institution of Municipal Engineers, has been a member of that body since its inception, and during the past four years has been a vice-president. He is the author of several papers dealing with mechanical and civil engineering matters, and last year was awarded the president's prize of the institution for the best contribution during the year. Educated at public and private schools, and at the University College, Bristol, he supplemented his pupilage and training by serving as an assistant at Dalton-in-Furness, whence he became engineer to the Preesall Urban District Council. At that time he was the youngest official holding a chief appointment. After four years he was elected from 126 applicants to be chief engineer to the Kingswood (Bristol) Urban District Council, and two years later was the successful applicant for the position of engineer to the Abersychan Urban District Council, a post for which 137 other applicants applied, and a position which he has now held for nearly eight years. Among his many works mention should be made of the successful design of some of the most modern public buildings, including swimming baths; one of the latter is considered to be the finest in the southern counties, and in it, by special request, he gave a display of the art of natation on the occasion of the official opening. He is an ardent housing reformer, and has been responsible for the creation of some very extensive schemes, one of which he outlined on the occasion of the last annual meeting, and for which he has received, not only the eulogies of his authority, but of the municipal world in general—even the most sceptical must acknowledge the genius that produced a scheme which included allotments, open spaces, recreation grounds, gas, water, and baths for a weekly rent of 4s. 9d. to 5s. 6d., and which shows a profit of £250 on a year's working. Mr. Whitwell is also responsible for the design and erection of one of the earliest ferro-concrete road bridges in South Wales, and at the present moment is the responsible engineer for a very large county scheme, including the design and erection of three large span bridges and some miles of highway. Mr. Whitwell's forte lies in mechanical engineering. He has made a special study of internal combustion engines, and is responsible for more than one useful improvement and some patents. Only a short time before the war he prepared an excellent treatise on the "Possibilities of Mechanical Traction," a copy of which was supplied to the Local Government Board at their own request. As was to be expected, he offered his services to his country immediately at the outbreak of war, and it was not long before his abilities were recognised, and he was chosen to undertake a special duty. A portrait of Mr. Whitwell appears in the form of an inset to this issue.

OBITUARY.

Mr. James Harwood, who for many years previous to his retirement was borough surveyor of Launceston, died last week, we regret to state.

County Road Surveyors' War Bonuses.—On Saturday last the Eastern Highways Committee of the Norfolk County Council had before them an application of the district road surveyors for a war bonus. The surveyors based their application on the increase in travelling expenses and the increased cost of living, and claimed that the effects of the war were more keenly felt by them than by any other officials in the service of the county council. They pointed out that out of their salaries they had to find the means of locomotion and bear the cost of office accommodation. Their salaries were £140 on appointment, and £180 maximum was reached in eight years. After deducting expenses the amount left was inadequate. The chairman said the county surveyor had ascertained what increases had been allowed in other counties, and it was found that in Herts a 20 per cent increase was allowed, the salaries there ranging from £120 to £180. In Kent, where they were £180, a war bonus of £15, with £10 extra for travelling expenses, was allowed. In the North Riding of Yorkshire, where the salaries were £160 and £170, a £22 increase towards expenses was granted. In the North Holland Division the salaries were £150, and the increases given were £20 for war bonus and £15 for expenses. The chairman said the Bills Committee had come to the conclusion that it would be reasonable to give £10 as a war bonus and £10 towards the increase in expenses. This proposal was unanimously adopted.

See End of Paper.

WILLESDEN DISTRICT COUNCIL.
ANNUAL CONTRACTS.

The Willesden District Council are prepared to receive Tenders from persons willing to enter into Annual Contracts, commencing April 1st, 1917, to execute the following Works or to supply the following Materials—viz.:—

1. Masons' and Paviors' Works.
2. Supply of Artificial Slab Paving.
3. Supply of Tar Paving and execution of Tar-paving Works.
4. Supply of Gravel, Flints, Burnt Ballast, &c., for repair of roads, &c.
5. Supply of Broken Granite for repair of roads, &c.
6. Supply of Lime, Cement, Salt-glazed-ware Pipes, &c.
7. Supplies of Oils and Chandlery.
8. Supply of Coal and Coke.
9. Barging of Road Slop, &c., from Fermoy Wharf.
10. Supply of Horse Provender.
11. Supply of Ironmongery and Tools.
12. Supply of Timber.
13. Wood-paving Works.
14. Supply of Horses, Carts and Drivers, for cartage of various descriptions.

Specifications and Forms of Tender may be obtained upon receipt of 5s. for each Tender Form, on and after Monday, January 22nd, 1917, upon application to Mr. O. Claude Robson, M.INST.C.E., Engineer to the Council, Municipal Offices, Dyne-road, Kilburn, N.W. The deposit for Tender Form will be returned upon receipt of *bona-fide* Tender.

Tenders to be delivered to the undersigned not later than 4 p.m. on Tuesday, January 30th, 1917.

The Council do not bind themselves to accept the lowest or any Tender.

(By order)
STANLEY W. BALL,
Clerk of the Council.

Municipal Offices,
Dyne-road, Kilburn, N.W.
January 17, 1917. (3,250)

REMOVAL OF HOUSE AND STREET REFUSE.

The Battersea Borough Council invite Tenders for the Removal of House and Street Refuse from the 31st March, 1917.

Forms of Tender, containing full particulars, may be obtained at the Town Hall, and must be returned to me, sealed and endorsed "Tender for Removal of Refuse," by 3 p.m. on Wednesday, the 24th January.

W. MARCUS WILKINS,
Town Clerk.

Town Hall,
Lavender-hill, S.W.
January, 1917. (3,252)

SOME RECENT PUBLICATIONS.*

THE ARCHITECTS' AND SURVEYORS' DIARY FOR 1917. In cloth gilt, 4s. London: Messrs. Waterlow Bros. & Layton.

We have received a copy of "The Architects' and Surveyors' Diary for 1917," and find that, notwithstanding war conditions, it is still a well-made, serviceable volume, full of useful matter for the professions it appeals to. Sections dealing with the Building Act, with its numerous amendments and by-laws, the various professional societies and their councils, the county and municipal surveyors and engineers of the country, the Housing and Town Planning Act, Regulations of the London County Council, the Board of Agriculture, and the Ecclesiastical Commissioners, the professional newspapers, and an abundance of general information and tables are features which all help to make the present year's issue as complete as any of its thirty-five predecessors, and we can safely recommend it as a most useful desk companion.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

TEMPORARY SURVEYOR'S ASSISTANT.—January 23rd.—Corporation of Aylesbury.—Mr. W. Harold Taylor, borough engineer and surveyor, Town Hall, Aylesbury.

TEMPORARY ASSISTANT.—January 29th.—West Hartlepool Town Council. £120 per annum.—Mr. Nelson F Dennis borough engineer, Municipal Buildings, West Hartlepool.

TEMPORARY ASSISTANT.—January 29th.—Somerset County Council. £120, with £20 for motor cycle.—Mr. Gordon R. Folland, acting county surveyor, Wells, Somerset.

TEMPORARY SURVEYOR AND INSPECTOR.—February 6th.—Ruislip-Northwood Urban District Council. £200 a year.—Mr. Edmund R. Abbott, clerk, Council Offices, Oaklands Gate, Northwood, Middlesex.

ASSISTANT ENGINEERS.—March 31st.—Indian Public Works and State Railways Department. Not less than twenty-one and not more than twenty-four years of age on July 1st.—The Secretary, Public Works Department, India Office, London, S.W.

Buildings.

NOTTINGHAM.—January 22nd.—For pulling down [illegible] and houses, for the Corporation.—City Architect, Guildhall, Nottingham.

[illegible] (Morocco).—February 16th.—For building [illegible] at an estimated cost of £7,000 for the authorities [illegible] of the "Junta de Servicios Locales." Terms at the Morocco Section of the Ministry of State, Madrid.

Engineering: Iron and Steel.

HALIFAX.—January 22nd.—For the supply of an [illegible] to pay-roll system [illegible] recovery plant at the [illegible] for the corporation.—Mr. Percy [illegible] Town Hall, Halifax.

Mechanically Propelled Vehicles.

LONDON.—January 24th.—For the supply of one 5-ton steam tractor and four 6-ton trailers, for the Metropolitan Asylums Board.—The Clerk, Asylums Board Offices, Thames Embankment, London, E.C.

WIGAN.—For the supply of a combination motor vehicle to serve as ambulance and prison van, for the corporation.—The Chief Constable, Town Hall.

Roads.

DORSET.—January 24th.—For the supply of granite, basalt, limestone, and tar-macadam, for the county council.—Mr. E. H. Habgood, acting county surveyor, County Offices, Dorchester.

STRATFORD-ON-AVON.—January 27th.—For the supply of 2-in. and ½-in. tarred slag, 2-in. and ½-in. dry slag, 2-in. and ¼-in. granite, and 2-in., ½-in., and ¼-in. limestone, for the corporation.—Mr. F. W. Jones, borough surveyor, Town Hall.

SOUTH STONEHAM.—January 29th.—For the supply of British macadam, to be delivered at various railway stations, for the rural district council.—Mr. F. Heather, district surveyor, Chevin Side, Old Portswood, Southampton.

WARRINGTON.—January 29th.—For the supply of road and sanitary requirements, for the corporation.—Borough Surveyor, Town Hall.

MIDDLESBROUGH.—January 30th.—For the supply of broken and unbroken whinstone, limestone, and tarred slag and whinstone, for the rural district council.—Mr. W. H. Dixon, district surveyor, Kirkby-in-Cleveland, near Stokesley, Yorks.

OTLEY.—January 31st.—For the supply of setts, kerbs and flags, granite macadam, pitch and tar, slag dust, tar-macadam, limestone macadam, and brushes, for the urban district council.—Mr. O. Holmes, surveyor.

NESTON.—January 31st.—For the supply of broken stone, chippings, and tarred macadam, for the urban district council.—The surveyor, Town Hall, Neston, Cheshire.

STOKESLEY.—February 1st.—For the supply of broken and unbroken whinstone, tarred limestone, and tarred slag and whinstone, for the rural district council.—Mr. W. H. Dixon, district surveyor, Kirkby-in-Cleveland, near Stokesley, Yorks.

LARNE.—February 1st.—For the supply of broken whinstone, for the urban district council.—Mr. W. G. Younge, clerk, Town Hall.

CANTERBURY.—February 1st.—For the supply of broken granite, granite chippings, granite dust, granite channelling, granite kerbing, and stoneware sewer pipes, for the corporation.—Mr. A. C. Turley, city surveyor, Municipal Offices.

HERTS.—February 1st.—For the supply of refined tar (to comply with the terms of the Road Board Specification, No. 1), for the county council.—Mr. J. S. Killick, county surveyor, County Surveyor's Office, Hatfield.

BATH.—February 3rd—7th.—For the supply of black rock, granite, flint, or other approved road stone, black rock gravel, Portland cement, fine and coarse sea sand, and lubricating oils, for the corporation.—City Surveyor.

EAST RIDING.—February 5th.—For the supply of about 8,000 tons of stone for macadamising the main roads, for the county council.—The County Surveyor, Beverley.

LITTLE HULTON.—February 5th.—For the supply of broken granite, 4 by 5 granite setts, tar-macadam, granite, limestone and slag chippings, grit, kerbs, stoneware pipes and gullies, and steam road rolling, for the urban district council.—Mr. J. H. Heyes, clerk, Council Offices, Little Hulton, Bolton.

SUNBURY-ON-THAMES.—February 5th.—For the supply of about 10,000 gallons of refined tar, for the urban district council.—Mr. H. F. Coales, surveyor, Council Offices.

SUTTON-IN-ASHFIELD.—February 5th.—For the supply of tar-macadam and broken slag, for the urban district council.—Mr. W. Burg, surveyor.

RUGBY.—February 5th.—For supplying horses and carts for road repairs, watering streets, and scavenging, for the urban district council.—Mr. J. H. Sharpe, surveyor, Benn Buildings, Rugby.

LITTLEHAMPTON.—February 7th.—For the supply of distilled tar, for the urban district council.—Mr. W. A. Clegg, engineer and surveyor.

* All of the publications reviewed, or referred to as received, can be obtained from the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of post books.

EASINGWOLD.—February 7th.—For the supply of whinstone and slag, for the rural district council.—Mr. F. J. H. Robinson, clerk.

BEXHILL.—February 9th.—For the supply of distilled tar, Tarvia, or other compounds for use in tar-spraying, for the corporation.—Mr. T. E Rogers, town clerk, Town Hall, Bexhill.

UXBRIDGE.—February 9th.—For the supply of granite, tarred granite and slag, gravel, flints and hoggin, and haulage, for the rural district council.—Mr. J. W. Harrison, engineer and surveyor, Corn Exchange, Uxbridge.

HERTS.—February 10th. — For surface tarring approximately 1,250,000 sq. yds. of main roads with refined tar, for the county council.—Mr. J. S. Killick, county surveyor, County Surveyor's Office, Hatfield.

CORNWALL.—February 10th.—For the hire of steam rollers, not exceeding ten, for a period of one year, for the county council.—Mr. L. D. Thompson, county surveyor, County Hall, Truro.

HERTS.—February 12th. — For the hire of steam and petrol rollers, for the county council.—Mr. J. S. Killick, county surveyor, County Surveyor's Office, Hatfield.

Sanitary.

SEDGEFIELD.—January 26th. — For scavenging various districts, for the rural district council.—Mr. J. W. Tweddle, inspector of nuisances, The Avenue, Coxhoe, Durham.

WEST BROMWICH.—January 26th.—For the removal of nightsoil and emptying cesspools, for the corporation.—Inspector of Nuisances, Sanitary Offices, High-street, West Bromwich.

BRADFORD.—January 31st.—For the supply of 20,000 cotton double filter press cloths, for the corporation.—Mr. F. Stevens, town clerk, Town Hall.

ROWLEY REGIS.—February 6th.—For emptying and removing house refuse, for the urban district council.—Mr. D. Wright, clerk, Council Offices, Old Hill, Staffs.

Stores.

BATTERSEA.—January 24th.—For the supply of veterinary attendance, horse hire, materials for cart and van covers, harness material and fittings, paints, special paints, enamels, painters' sundries, varnish, tools, ironmongery, granite, macadam and chippings, tar-macadam, tar paving, York paving, Thames ballast and sand, stoneware pipes, timber for carpenters and joiners' work, timber for wheelwrights' work, bricks, cement, lime, slates, iron castings (side entrance covers, iron bars for blacksmiths' work, removal of house and street refuse and manure from the council's stables, disinfectants, coal and coke, and soaps and oils, for the borough council.—Mr. W. Marcus Wilkins, town clerk, Town Hall, Battersea, London, S.W.

CHELSEA.—January 24th.—For the supply of various articles and works, for the borough council.—The Town Clerk, or Mr. T. W. E. Higgens, borough surveyor.

MERTON.—January 26th.—For the supply of horse hire, flints and gravel, tar paving, Portland cement, stoneware pipes, brooms, tools, sewerage ironwork, broken granite, cartage of road materials, tar, grit, tar-macadam, and the surface tarring of roads, for the urban district council.—Mr. C. J. Mountfield, clerk, Council Offices, Kingston-road, Merton.

BISHOP AUCKLAND.—January 27th.—For the supply of sanitary pipes, manhole and lamphole covers, gully grates and frames, channel boxes, cement, spades, picks, brooms, brushes, whinstone, slag, flags, kerbs, setts, disinfectants, iron pipes, valves, and hydrants for the urban district council.—The Surveyor, Town Hall Buildings, Bishop Auckland.

OXLEY.—January 31st.—For the supply of setts, kerbs, flags, granite macadam, pitch and tar, slag dust, tar-macadam, limestone macadam, and brushes, for the urban district council.—Mr. O. Holmes, surveyor.

MIDDLESBROUGH.—February 1st.—For the supply of annealed scoriæ (broken), bricks, castings, concrete flags and kerbs, Portland cement, pitch and tar, sanitary pipes, gullies, junctions, slag (broken), coal (for domestic use only), coke, timber, whinstone and granite (broken), whinstone and granite setts and kerbs, brushes, bolts and nuts, disinfectants, electric lamps, general stores, glass, hardware, india rubber goods, iron and steel, leather belting, oils, paints and varnishes, packings, picks, shovels and shafts, polishes and cleansing materials, and ropes, for the corporation.—Mr. Preston Kitchen, town clerk, Municipal Buildings.

GILLINGHAM (Kent).—February 2nd.—For the supply of road materials, Portland cement and lime, requisites for precipitation works, sewer ironwork, bricks, oils, general stores and ironmongery, and disinfectants, for the town council.—Mr. J. L. Redfern, borough engineer and surveyor, Corporation Offices, Gillingham, Kent.

SWANSEA.—February 2nd.—For the supply of gullies, lamp pillars, lanterns, paving, kerbing, channelling and pitching, disinfectants, broken syenite, broken limestone, chippings, gravel, tar-macadam, refined tar, manhole covers, ventilating gratings, charcoal baskets, and step irons, for the corporation.—Borough Surveyor, Guildhall, Swansea.

GRIMSBY.—February 2nd.—For the supply of whinstone macadam, slag, artificial flags, Yorkshire flags, Yorkshire kerbs, granite setts, granite kerbs and channel, pitch, coal-gas tar, Buxton quicklime, blue lias lime, dog-kennel lime, Portland cement, drainage pipes, miscellaneous brushes, scavenging brushes, drysalteries, lubricating oils, oils, paints, bottles and corks, carbolised oil, disinfectant fluid, disinfectant powder, Formalin, and Formalin tablets, for the corporation.—Mr. H. Gilbert Whyatt, borough engineer and surveyor, Municipal Buildings, 170 Victoria-street, Grimsby.

ACTON.—February 3rd.—For the supply of road and sanitary requirements, and hire of steam roller, for the urban district council.—Mr. W. Hodson, clerk, Council Offices, Acton, London, W.

SALISBURY.—February 9th.—For the supply of brushes, refined tar, oils, and disinfectants, for the corporation.—City Engineer and Surveyor, Endless-street, Salisbury.

Miscellaneous.

BANBRIDGE.—February 3rd.—For the public lighting of the urban district with gas or electricity, for the urban district council.—The Surveyor, Municipal Offices, Banbridge.

FORTHCOMING MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

JANUARY.

25.—Concrete Institute: Mr. C. R. Peers on "The Care of Ancient Monuments."

FEBRUARY.

9.—Town Planning Institute: Prof. S. D. Adshead on "Monumental Memorials and Town Planning." 6 p.m.

EXPERIENCED CLERICAL ASSISTANT wanted for the period of the War. Must be ineligible for military service. Knowledge of prime costs essential; shorthand and typewriting desirable. Apply, stating age, qualifications, experience, and salary required, to Borough Engineer, Lambeth Town Hall, Brixton, London, S.W. (3,248)

WANTED, immediately, a Resident Engineer for Sea Defence Work at Sidmouth. The appointment will be for 6 to 9 months.

Preference will be given to candidates with experience in heavy sea defence works, and the salary offered is 3 guineas per week.

Applications, with three copies of testimonials, should be sent at once to the Engineer, Mr. Samuel Hutton, Public Hall, Exmouth. (3,241)

RUISLIP-NORTHWOOD URBAN DISTRICT COUNCIL.

TEMPORARY APPOINTMENT OF SURVEYOR AND INSPECTOR OF NUISANCES.

The above Council require the temporary services of an Assistant Surveyor and Inspector of Nuisances, at a salary of £200 per annum.

Applicants must be exempted or that they are asked to take the place of the official who may be called up for military service, must be ineligible for military service.

Candidates must be experienced in surveying, preparation of plans and estimates, road making, drainage, sewage treatment and sanitary matters, and be able to satisfy the requirements of the Local Government Board as an Inspector of Nuisances (the appointment of Inspector being subject to the approval of such Board). The Inspector's duties will include those under the Public Health Acts, the Orders of the Local Government Board, the By-laws of the Council, the Dairies, Cowsheds and Milkshops Orders, the Factory and Workshops Act, 1891, the Housing and Town Planning Acts, the duties of Inspector of Petroleum, &c.

The successful candidate will be required to devote his whole time to the service of the Council, to give satisfactory security in the sum of £300, and to reside within the district.

Canvassing, either directly or indirectly, will disqualify.

Selected candidates will have notice to attend on the day of election, and will be allowed third-class railway fare.

Applications, endorsed "Surveyor and Inspector," stating age, experience, and qualifications, with copies of not more than three recent testimonials, must be sent to me, the undersigned, not later than the 6th February, 1917.

EDMUND R. ABBOTT,
Clerk to the Council.

Council Offices,
Oaklands Gate,
Northwood (3,238)

COUNTY BOROUGH OF WEST HARTLEPOOL.

TEMPORARY ASSISTANT.

Wanted, Assistant Surveyor in the Borough Engineer's Department. The person appointed, who must be ineligible for military service, will be principally engaged upon work in connection with Town Planning. Salary at the rate of £120 per annum.

Applications and testimonials to be forwarded to the undersigned not later than the 29th instant.

NELSON F. DENNIS, M.INST.C.E.,
Borough Engineer.

Municipal Buildings,
January 15, 1917. (3,244)

SOMERSET COUNTY COUNCIL.

Wanted, Temporary Assistant in County Surveyor's Office. Must have a good knowledge of modern road and bridge construction, be an active motor cyclist, and ineligible for the Army. Salary £120 per annum, with allowance of £20 per annum for the upkeep of a motor cycle, which will be provided. Applications, giving age and full particulars of experience, must be delivered not later than first post Monday, the 29th January, 1917, to

GORDON R. FOLLAND,
Acting County Surveyor.

Wells, Somerset. (3,246)

TENDERS WANTED.

CORNWALL COUNTY COUNCIL.

HIRE OF STEAM ROLLERS.

Tenders are invited by the County Council for the Hire of Steam Rollers (not exceeding ten) for a period of one year from the 1st April, 1917.

The Steam Rollers are to be fully equipped 12½-ton engines of modern type, fitted with approved scarifiers, and will have to be provided and delivered when required at such places or places in the County as may be directed by the County Surveyor.

The Contractors shall provide efficient drivers, also oil, waste, tires and stores, and each engine must be accompanied by a living-van, capable of accommodating at least three men, and a water-cart fitted with pump.

Tenders must contain prices, both including and excluding fuel, and must state if the Rollers offered are simple or compound.

The engines, scarifiers, living-vans, water-carts, and all tackle to be entirely to the satisfaction of the County Surveyor.

The Contractors to keep and maintain the hired Steam Rollers and their appliances in proper and thorough working order during the whole period of hire.

The Contractors will be required to enter into a Contract with the County Council.

The County Council do not bind themselves to accept the lowest or any Tender.

Sealed Tenders to be forwarded to the undersigned not later than Saturday, 10th February, 1917, endorsed "Steam Rollers."

L. D. THOMPSON,
County Surveyor.

County Hall, Truro.
January 15, 1917. (3,249)

COUNTY BOROUGH OF SWANSEA.

TENDERS FOR STORES, STONE, &c.

The Council of the County Borough of Swansea invite Tenders for the undermentioned Stores, Stone, Ironwork, &c., during the year to end 31st March, 1918:—viz.:—

Gullies, Lamp Pillars, Lanterns, Paving, Kerbing, Channelling and Pitching, Disinfectants, Broken Syenite, Broken Limestone, Chippings, Gravel, Tarmacadam, Refined Tar, Manhole Covers, Ventilating Gratings, Charcoal Baskets, and Step Irons, as may be necessary.

Forms of Tender and further particulars may be obtained at the Office of the Borough Surveyor, Guildhall, Swansea.

Sealed Tenders, endorsed "Tender for ——," to be delivered at the Town Clerk's Office not later than 12 noon on Friday, the 2nd February, 1917.

The lowest or any Tender will not necessarily be accepted.

H. LANG COATH,
Town Clerk.

Guildhall, Swansea.
January 15, 1917. (3,245)

COUNTY COUNCIL OF MIDDLESEX.

TO QUARRY OWNERS, GRANITE MERCHANTS AND OTHERS.

Tenders are invited for the Supply of about 7,500 tons (more or less) of 2-in. and 1½-in. Hand-broken Basalt for road construction, and 500 tons (more or less) of ¾-in. Clean Chippings, to be delivered from the various Stations in Middlesex.

Particulars, with Specification and Form of Tender, may be obtained at my Offices after Monday, the 15th instant.

Tenders must be sent to the Clerk of the County Council, Middlesex Guildhall, Westminster, S.W., by 12 o'clock (noon) on Wednesday, the 7th February, 1917.

The lowest or any Tender will not necessarily be accepted.

H. T. WAKELAM,
County Engineer.

County Engineer's Office,
Middlesex Guildhall,
Westminster, S.W.
January 9, 1917. (3,237)

BOROUGH OF STRATFORD-UPON-AVON.

TENDERS FOR ROAD MACADAM for the Year Ending March 31st, 1918.

The Stratford-upon-Avon Town Council invite Tenders for the Supply of 2-in. and ½-in. Tarred Slag; 2-in. and ½-in. Dry Slag; 2-in., ½-in., and ¼-in. Granite; 2-in., ½ in., and ¼-in. Limestone, in accordance with Specification to be obtained, with Form of Tender, on application to the undersigned.

Tenders, with samples of the materials to be supplied, to be lodged with the Borough Surveyor, sealed and endorsed "Tender for Macadam," not later than Saturday, January 27th inst.

The Town Council does not bind itself to accept the lowest or any Tender.

F. W. JONES, A.M.I.C.E.,
Borough Surveyor.

Town Hall,
Stratford-upon-Avon.
January 4, 1917. (3,230)

The Surveyor

And Municipal and County Engineer.

Vol. LI. JANUARY 26, 1917. No. 1,306.

Municipal Engineering in 1916.

Our Special Annual Issue once more takes the form of a *résumé* of municipal engineering work during the twelve months preceding its publication. We have retained this form not only because of its convenience, but also because of the appreciation with which it has always been received. Once more the war dominates everything. Its effects upon municipal engineering are very direct because of the rigid economy that is being enforced and also because of the exceptionally heavy demands which military movements have made upon the roads of the country. As regards bridges, very few have been built during the year. Indeed, if we allow our survey to extend to the Continent of Europe the record is one of destruction rather than construction. Our home bridges have generally been called upon to bear greatly increased weights, especially in the removal of heavy guns and munitions. Presumably, arrangements have been or will be made by the Government to secure their safety, or for the payment of compensation in case of damage. With regard to electricity supply, the war has, on the whole, had a stimulating effect. It is true that there have been difficulties, due principally to the high cost of materials, especially fuel and labour, and the difficulty of obtaining plant for extensions. But, as last year, there has been a further phenomenal growth in the power load. The most notable development has probably been in connection with the linking-up of neighbouring undertakings with a view to increased economy, reliability, and efficiency. It is to be hoped that the future will witness further efforts in the same direction. With reference to highway administration we have once more to record that the economy cry has led many highway authorities to reduce their expenditure to such an extent as to jeopardise the very existence of the roads for which they are responsible. War conditions have rendered it more necessary than ever that our home roads should be kept in a high state of efficiency. Not only are they called upon to bear a greatly increased burden of traffic, especially in munition centres and near camps, but at the same time the shortage of labour and materials renders it difficult, even with the best will in the world, to keep them in as good a state as they were when they had to suffer much less wear. It is obvious, therefore, that if the will be wanting, or if there be any disposition to starve this service, disaster must ensue. As we pointed out last year, war conditions have produced some astonishing results in regard to housing. Apart from the special case of the great munition centres, the Government have practically stopped all building. The result is that the scarcity of houses which undoubtedly existed before the war has become accentuated. That this is realised by the authorities is shown by the disposition to urge forward in every possible way the immediate preparation of housing schemes, with a view to their execution after peace is declared. The disposal of refuse has been considered again during the past year chiefly as a possible source of economy in municipal expenditure. No new destructor works have been erected, but efforts have been made, probably on a larger scale than ever before, to convert ordinary town refuse into useful commodities instead of destroying it by burning. More than one scheme for this purpose has been described in our columns, and all of them are referred to in the special article on the subject. We agree with our contributor that it is to be hoped that the efforts in the utilisation of waste products, which have been engendered by the special conditions caused by the war, will not be relaxed in peace time. As regards sewerage and sewage disposal, we were able last year to refer to the issue of the Final Report of the Royal Commission. This year there is nothing further to record in this direction, but again the work of the past twelve months has been directly affected by war conditions. It has been suggested, indeed, that the waste products in sewage may be utilised for the production of explosives. How far this is being or can be practically accomplished we are not in a position to state. Generally, it may be said that only work of the most urgent character, which in most cases has been paid for out of revenue, has been carried out during the past year. It may seem a little out of place to refer to street lighting as a branch of municipal work in these days. The problem which confronts the engineer to-day is not so much how to light the streets as how to keep them dark. Our contributor on this subject, therefore, devotes most of his article to a discussion of the methods of avoiding illumination. Town planning has during the past year been the subject of much good work. It is evident that in present conditions the actual execution of schemes is not to be expected. Interest in the subject has, however, been well maintained. Several important papers have been read, and at least two interesting competitions have been decided—namely, those at Dublin and York respectively. It only remains to mention two other subjects—namely, tramways and water supply. As regards the former, new construction has remained at a standstill, but the hands of tramway managers have been kept full in dealing with problems arising out of the shortage of staff and labour. Work in connection with water supply has also practically ceased for the present, first because of the necessity for economy, and, second, because of the shortage of labour, materials, and machinery. The difficulties of water engineers have been increased owing to the high cost of fuel. The maintenance of a full supply of pure water is of such obvious importance that there is perhaps less need in this connection than in some others to utter a warning against the dangers of false economy. If such a warning be needed, it was uttered with great weight by Mr

Brabner, who showed, in the paper which he read before the Royal Sanitary Institute, that no diminution in the quality or quantity of the water supply should be practised merely as a measure of economy. It is impossible to forecast what the future of municipal engineering work will be. As the war goes on the patriotism of municipal engineers becomes more and more evident. All who can be spared are serving in the field, while the older ones are cheerfully undertaking more onerous duties at home. Our conviction is that in the future, as in the past, the public interest will be the guiding motive in the work of every member of the profession.

BRIDGES.

Very few new bridges have been built during the past year, for, although it is now generally admitted that many of the existing road and railway bridges are stressed to their utmost safe limit, and that many new bridges are urgently required, the exigencies of the war are such that risks have to be taken, and the inconvenience and loss of time and money have to be borne with the best grace we can command.

A draft report has been prepared by the Joint Committee of the Concrete Institute, the Institution of Municipal and County Engineers, and the Institution of Municipal Engineers, which was appointed in 1911, under the chairmanship of Prof. H. Adams, M.Inst.C.E., to investigate the question of the loads to be provided for on highway bridges, but the report has not yet received its final form, and has not been published.

The great increase in the weight of the loads now carried on our roads, especially in the removal of heavy guns and munitions, or by the heavy motor wagons from our industrial towns, may make it necessary to revise this report before it is issued to the public. The War Office are bound to see that any future bridges are made sufficiently strong to meet all military requirements, and municipal engineers throughout the country will be glad to receive this report to assist them in designing their bridges to meet these new conditions.

The House of Lords have recently decided that the railway companies are not bound to maintain highway bridges strong enough to carry present-day traffic, but only need to keep them up to their original standard of construction. This is a serious matter for the county and other local authorities, for there can be little doubt that the traffic transferred from the railway to the road by rate is large, and that in many cases the cost of reconstruction or strengthening must come out of the pocket of the public instead of from the railway companies.

The Quebec Bridge Disaster.

The past year has been chiefly remarkable for an accident for the second time to the Quebec Bridge, and the agitation for the removal of Charing Cross Bridge and replacing it with a monumental road bridge.

On September 11th of last year the central span of the new bridge across the St. Lawrence, at Quebec, collapsed while being hoisted into position, and resulted in a loss of twenty lives. The central span was 640 ft. long, 88 ft. wide, 110 ft. high at the centre, and weighed over 5,000 tons. Unfortunately, this was the second time disaster had overtaken the bridge in recent years, for in 1907 the southern span fell, causing the loss of seventy-five lives. Though some doubts were felt about the strength as designed by the previous engineers, the recent accident does not appear to have been due to faulty design, but owing to a flaw in a casting of one of the bearers.

Charing Cross Bridge.

The proposal of the South Eastern Railway Company to expend £1,500,000 in strengthening and widening Charing Cross Bridge met with strong opposition from many quarters, and Parliament refused to sanction their Bill for this purpose. The opposition contended that it was necessary for the interests and safety of the public that the bridge should be strengthened. The opposition was led by Sir Aston Webb, R.A., and Mr. John Burns, M.P., and they were supported by many other well-known men. They strongly objected to the company's proposal to perpetuate this ugly bridge, which is admittedly an eyesore on the Thames, and they advocated replacing the existing steel railway bridge with a monumental road bridge and placing the station on the Surrey side of the Thames.

Mr. John Burns, in his forceful and picturesque language, described the bridge and station as an abomination which should never have been permitted, and said that both should disappear, so that "the Thames might be relieved of that ugly red oxide Behemoth that sprawls from north to south." He suggested a new station on the Surrey side, with a new vehicular bridge of the finest description connecting the north and Surrey sides, and that the London County Council, the two adjoining borough councils, and possibly the City Corporation, ought to co-operate in providing it.

Sir Aston Webb urged that the bridge and station were unworthy of their position, were very unsightly, and so poorly designed that the original station roof had fallen down, and the bridge now required strengthening. It is claimed that the land for a new station on the south side of the Thames can be acquired easily and cheaply, that a new road bridge with fine open spaces at each end would relieve the traffic on the other bridges, and would allow a great civic improvement to be made by laying out a boulevard similar to the Embankment on the north side. Municipal engineers will follow the development of these schemes with a lively interest, and it is to be hoped that the authorities responsible for these improvements will secure the assistance of an experienced municipal engineer when they decide upon the lay-out of the bridge and roads.

Destruction of Bridges in the War Area.

To turn to the war area, the past year has seen the destruction of a portion of the great Roumanian railway bridge of Cernavoda. This bridge, which was completed in 1896, cost 10,000,000 francs. It is nearly 11 miles long, and carries the railway between Bucharest and the port of Constanza on the Black Sea, and consists of two main bridges over the arms of the Danube and a series of viaducts and embankments crossing the marshes. This is the most important bridge destroyed in the war area during the past year, but it is only one of many. This destruction calls for a large amount of bridging work by the engineering sections of all the opposing armies, mostly of an emergency character. The bridges used by the Germans on the Danube are of the pontoon type, but on the Western Front the wooden-girder type is mostly used, though steel and concrete are also used. Temporary bridges of great length have been used, but 70 ft. is as great as it is practicable to push into position with the restricted resources of the field companies of engineers.

Miscellaneous.

A number of concrete bridges have been described and illustrated in our columns during 1916. One of the most interesting of these is the reinforced-concrete sewer aqueduct over the River Barwon and flats in Australia (January 28, 1916). The length of the aqueduct is 2,424 ft., and it is

designed on the cantilever system, with fourteen spans, thirteen of 176 ft. and one of 136 ft. centres. A footpath is constructed over the sewer, and a hand-rail serves as a girder 40 ft. long to bridge the gap between the cantilevers, which are 136 ft. from point to point.

Cranford Bridge, by Mr. H. T. Wakelam, M.INST.C.E., was described in our issue of May 12, 1916, and a very interesting set of illustrations and details of thirteen road bridges built in ferro-concrete to replace the bridges washed away in Norfolk in the disastrous floods of 1912 were given on June 2, 1916.

In May last the Longton Bridge, Cumberland, one of the finest concrete bridges in Great Britain, was officially opened. It is 625 ft. from end to end, and has three arch spans of 147 ft. 6 in. and 175 ft.

An interesting series of canal bridges is given in the March number of *Ferro-Concrete*, which shows how readily and economically, and with what variety of design this material can be used. The Canal Bridge at Burlington-street, Liverpool, designed by the city engineer of Liverpool, Mr. J. A. Brodie, M.INST.C.E., in ferro-concrete, shows with what artistic effect concrete can be used when designed with good taste and a proper use of architectural details.

The Arroyo Seco Viaduct, Pasadena, California, spans a picturesque valley, and is 1,470 ft. long, of which 800 ft. is on a curve and the remainder on a tangent. It has six spans of 113 ft. each, two of 151 ft. 6 in., one of 223 ft., and six arched girder spans and abutments at each end.

The highest arched-roadway viaduct in the United States is the high-level bridge recently constructed over the Cuyahago River Gorge near Akron, Ohio. It is 190 ft. from the bed of the stream to the level of the road, is 781 ft. long, and has a 24-ft. roadway and two 4-ft. footpaths. The five main arches are 127 ft. centre to centre of piers.

The Keadby Bridge over the Trent, 14 miles north of Gainsborough, recently completed by the Great Central Railway Company, claims the distinction of being the heaviest lifting bridge yet constructed in Europe. It is a combined railway and road bridge of five spans, the two fixed river spans being 135 ft. each, a lifting span of 160 ft., with a clear waterway of 150 ft., a track span of 40 ft., on which the lifting span rolls, and a 70-ft. approach span on the banks of the river. It is 53 ft. 6 in. wide, 29 ft. 3 in. railway, and 24 ft. 3 in. roadway. The weight of the lifting span is about 3,000 tons. It is worked by two 115-h.p. direct-current motors, and can be opened or closed in two minutes.

Among other interesting bridges which we have described are the Alexandra Bridge, Pietermaritzburg (July 14, 1916), and a series of ferro-concrete bridges in the Twrch Valley, Glamorganshire (October 27, 1916).

ELECTRICITY SUPPLY.

Like all other great undertakings, the business of electricity supply has been seriously affected by the strenuous conditions which have obtained during the second year of war. The high cost of materials—especially fuel—and labour, the difficulty or impossibility of obtaining plant for extensions or funds to pay for it, the restrictions on lighting, and the heavy demand for power, have all combined to impose a burden of anxiety upon the managers of electricity works and their committees or directors, and the loss of many of their skilled assistants and workmen, through the operation of the Military Service Act, in some instances has strained their endurance almost to the breaking point. Under these trying circumstances it redounds to the credit of the central-station engineers that they have courageously shouldered their tasks without complaint, and without sparing themselves, and with rare exceptions have succeeded in maintaining the supply of electricity without interruption, although in many cases their plant has been heavily overloaded and has had to cope with continuous demands for power by night as well as by day.

POWER SUPPLY.

As in the earlier stages of the war, the phenomenal growth of the power load has been a striking feature of the year. Never before have the advantages of a cheap and reliable source of motive power been so emphatically brought home to manufacturers, who, impelled by necessity, have eagerly turned to the public mains for the indispensable supply of energy. The inevitable consequence has followed that the demand has overtaken the available supply, and, where the manufacture of munitions of war or other national work has been in question, the supply undertakers have had to invoke the sanction and assistance of the Government in order to obtain additional plant and mains. In many instances new factories have been erected in the neighbourhood of comparatively small power stations, which, probably to the astonishment of their managers, have consequently become important undertakings equipped with three-phase turbo-generators and the most up-to-date accessories. We could cite several examples of such stations situated in places where a heavy power load would never have been dreamt of but for the war, and others in small industrial areas whose output has increased by leaps and bounds, completely transforming the prospects and potentialities of the undertakings.

But it is in certain cities already deeply engaged in the supply of motive power that the situation has presented the greatest difficulties, owing to the large size of the additional generating plant that has had to be provided and the short time in which it had to be put in operation. In some instances it has at times been found necessary to cut off the supply to the tramways, in order to maintain an adequate supply to the all-important factories; in others it has, unfortunately, been necessary to refuse a supply to prospective consumers of large blocks of power, thus compelling the latter either to obtain plant of their own, with the aid of the Government, or to choose some other locus where a supply of electrical energy could be got.

It is not in the public interest that details should be given regarding these places and incidents, but after the war there will be many disclosures of very great interest to all who are concerned with electricity supply. In one important town the engineer and his chairman were compelled to act in advance of their committee, and to put through enormous transactions at the shortest notice in order to cope with the demands that were made upon them, trusting to obtaining the approval of the committee at leisure after the event.

While it may be pointed out that the present heavy loads and outputs are recorded under war conditions, it cannot be doubted that the experience gained by new users of electrical energy, and the installation of motors and machinery on an enormous scale, will result in a permanent increase in the utilisation of electric power, and will confer immense benefits upon the business of electricity supply, as well as upon the industries which profit by this wholesome and drastic process of rejuvenation.

LINKING-UP ELECTRICITY WORKS.

The most notable development in connection with public electricity supply during the year has

been the movement towards the linking-up of neighbouring undertakings with a view to increased economy, reliability, and efficiency. The idea was not new; it received official approval when the Board of Trade, some years ago passed a Bill through Parliament authorising municipal supply undertakers in the Metropolitan area to connect their systems with one another, and, later, with those of supply companies. As the outcome of this Act many such connections were made, with gratifying results, and many more were contemplated when war broke out. We may add that great progress has been made in this direction since that date.

But in the provinces very little had been done by way of co-operation, and the view that supply should be given over large areas from very large generating stations was regarded rather as a remote ideal than as practical politics. For this condition the sub-division of the country into small municipal areas, each provided with its own isolated and self-contained plant and mains, was directly responsible. The large power supply companies, on the other hand, had always adopted the practice of concentrating their plant and linking-up their generating stations, a policy which attained its greatest and most successful development in the Tyneside district, where some sixteen stations, large and small, are connected to a common network of mains covering an enormous area.

The question was raised early in the year by the action of the Institution of Electrical Engineers, which discussed a paper by Mr. E. T. Williams on the reform of electricity supply in this country. The matter was vigorously taken up in Lancashire, where a large number of generating stations are situated in close proximity, and a powerful stimulus was given to the movement by the Board of Trade, which issued a circular letter urging supply authorities to co-operate with a view to economising fuel. The Incorporated Municipal Electrical Association, the Associated Power Companies, and the Institution of Electrical Engineers in June appointed two influential committees to promote the scheme, and with their aid local committees were formed in various centres to investigate the matter and formulate proposals in accordance with local conditions.

Good progress has already been made towards organising those areas in which suitable conditions obtain. Some opposition has been raised to the scheme on technical grounds, and the personal element is an important feature of the problem, as many engineers and managers in some cases are somewhat dubious as to their prospects under the proposed regime, seeing that the inevitable tendency would be towards the gradual conversion of the smaller installations into distributing stations, and the concentration of generating plant in large stations—a result highly desirable from the national point of view, but not necessarily attractive to the individual. The economies that would be realised, however, would so materially reduce the cost of supply that in all probability the output would in no long time be greatly increased and the positions of these engineers would be correspondingly improved, while the financial position of those undertakings would benefit with advantage to themselves.

As regards the technical objections, the fact that not only in other countries, but also in this country, the interconnection of generating stations has been carried out with great advantage disposes of their importance, and experiments actually carried out recently between two of the stations in South Lancashire gave very satisfactory results. The chief item of expenditure that will be necessary is the cost of the connecting cables, but the Treasury has promised financial assistance, and, moreover, the cost of the cables will be quickly recouped by the saving in fuel and labour, and the reduction in capital cost of generating plant.

FUEL ECONOMY.

Apart from the question of linking-up, the necessity of economising fuel has received a great deal of attention during the past year. The fact that the methods of generating electrical energy at present in vogue, although vastly improved in efficiency in comparison with the conditions of ten years ago, are greatly deficient in that they fail to utilise the fuel to the best advantage, has been universally recognised, and committees have been appointed by the British Association, the Government, and other bodies to take steps towards amendment in this respect. The fundamental fact is that by the direct combustion of coal under boilers the whole of the valuable by-products are wasted. The only remedy for this is to gasify the bulk of the coal, preferably at a low temperature, and to recover the by-products, burning the gas under the boilers. Not only would this practice achieve the desired object, it would also revolutionise the organisation of the boiler-house, and greatly simplify the control of the steam-raising plant. New problems would, however, have to be dealt with in connection with the gasifying plant, and it would be necessary not only to burn the gas obtained from the carbonising process, but also to gasify a large proportion of the resulting coke, and consume it in the same manner, as otherwise an immense quantity of coal would have to be handled, and the output of coke would be vastly in excess of the requirements of the market. On the other hand, the soft coke resulting from the carbonisation of coal at a moderate temperature, unlike the hard coke produced in gasworks, makes an excellent smokeless fuel for domestic purposes, and in time a large demand would spring up from this quarter, especially if the use of coal in open grates were restricted by Government action.

It will be seen that the problem presents many aspects, without touching upon the question of generating electrical energy at the coalfields, and similar projects. Changes must be tentative and gradual, but that changes will come at no distant date appears to be beyond question.

QUESTIONS OF MANAGEMENT.

The altered conditions have naturally affected the cost of production of electrical energy very materially, and the movement towards higher prices, which was in progress in 1915, has continued throughout the past year. The high cost of coal has especially affected the supply of energy for motive power, and the prices for the latter in many cases have been put up 25 per cent. The increase in the case of lighting supply, which depends to a less extent upon the cost of fuel, has been in the neighbourhood of 10 per cent as a rule, but in every case local conditions have played an important part in the matter, and wide variations are shown between different undertakings. The same applies to the gross and nett profits recorded, some towns having made larger profits than ever before, while others show a deficit on the year's working.

Among other benefits derived from the war has been the establishment of new industries in this country in which electrical energy plays an essential part, as in electro-chemical processes, refining steel in electric furnaces, and so on. There is a magnificent field for development in this class of industries, particularly where, as has been done in some cases, arrangements can be made to cut off the supply during the time of peak load on the generating plant. By this means it is possible to maintain the demand at an approximately constant value, an ideal condition which enables the engineer to produce electrical energy at minimum

cost. Another possible opening for electricity supply is slowly gaining appreciation—namely, for agricultural purposes. How useful electricity can be made on farms is better realised abroad than in this conservative country, but already, at Hereford, very substantial progress has been made, with gratifying results, and there is good reason to believe that equally good results can and will be obtained in other districts. At the Incorporated Municipal Electrical Association meeting in June a paper on this subject, read by Mr. W. T. A. Kerr, city electrical engineer of Hereford, on the uses of electricity in agriculture, together with the discussion which followed, was the outstanding feature of the gathering.

With the informal inauguration of a public supply of electricity by the borough council of Bethnal Green in June, that authority has at last carried a good intention into effect and has ended the reproach that it was the only Metropolitan borough in which electricity could not be purchased.

HIGHWAYS.

The past year has been one of great difficulty for surveyors in all parts of the country. Staffs have been so further depleted that it has only been possible to "carry on" by working at high pressure, and to a great extent it has been impossible to maintain the high standard of efficiency which existed in pre-war times. Many of our large towns have suffered enormously, as can be judged from a report recently made by the city engineer of Liverpool, Mr. J. A. Brodie, M.INST.C.E., in which he states that eighty-five of his staff have either been killed or died of wounds or sickness at the Front. Not only have losses been suffered for military purposes, but the lure of the high pay to be obtained in munition works throughout the country has attracted many of the best workmen on the surveyors' staffs.

The cry for "war economy" has led many councils to cut down road expenditure to an extent which in some cases has brought the roads to the destruction point. Even where money has been forthcoming, materials have been difficult to obtain, and in other cases where materials could be obtained it has been impossible to obtain the labour to use them on the roads. At a time when tar has been cheaper than for many years past, labour has been so scarce that few surveyors have been able to use it to the extent they have desired. Women have to some extent replaced men for the work of tar-painting, but the supply has not been equal to the demand. Coupled with the scarcity of labour, we have had an abnormally wet season, so that the difficulty experienced in keeping the roads even in a fair condition has become increasingly great. November, during which 9 in. of rain fell, was the wettest month for many years, and following a wet autumn many tar-painted roads have got into a deplorable condition.

NEGLECTED ROADS.

In addition to the trouble caused by the scarcity of labour and materials, and the weather, many roads have had to carry a greatly increased traffic, especially in munition centres, near camps, and at our large industrial towns and seaports. The greatly increased use of heavy motor wagons, consequent upon the commandeering of the railways by the Government, has shown the great need for better and stronger foundations than are found on most of our main roads, especially in the rural districts. Much good work had been done in this direction in the years just before the war, and it was only the improved condition of these roads that has enabled them to carry this increased traffic without showing serious signs of deterioration. This is in many cases merely living on capital, and, unless steps are taken to preserve a fairly high standard of maintenance, we must pay heavily in the near future for the repair of the damage due to our present neglect. That there is neglect, due in most cases to circumstances which neither the councils nor their surveyors can control, is beyond dispute, and it is difficult to see how we are to get our roads back to their pre-war condition unless the War Loan is followed by a Road Loan.

The Road Board's income has been largely appropriated for war purposes, and the sixth annual report of the board shows that application for only £310,261—of which £297,038 was for improvement of road crusts—was made during the year which ended on March 31st last. Compared with the previous year, this shows a decrease of £1,691,063, and of £2,283,544 compared with 1913-14. In February last year the Retrenchment Committee suggested that all grants for road improvements should be entirely suspended, and the board only sanctioned loans or grants for 1916-17 of £200,000, and that mainly for refined-tar treatment. The board have carried out a large amount of road making for the military authorities in the neighbourhood of camps, and they have also done similar work for the Admiralty and the Ministry of Munitions. The estimated cost of this work up to June 30th last is £1,809,621.

Forced economy has led surveyors to adopt many unusual shifts to maintain their roads in a decent, usable condition. Cheaper materials, especially for foundations, have been largely used. The success with the use of tarred clinker for foundations has caused it to be much used, and when surfaced with a harder material, such as Mexphalte, as at Hornsey and other places, it has been very successful. It has also been used for surfacing lightly trafficked streets more largely, though this can hardly be considered a novelty when we take into consideration the number of years Mr. F. Roberts has employed it at Worthing.

Further economy has been practised by many surveyors by cutting their old, worn wood blocks or stone setts, and this, with the high price of wood blocks and stone setts, represents a great saving. Though these methods are wise and necessary under present conditions, the question arises as to how far the use of a material like tarred clinker for surfacing roads can be justified in normal times. If there is a moderately heavy traffic a material that varies so greatly in its strength and consistency as clinker does cannot have a long life, and, as the quantity of tar required for a hungry material like clinker is much greater than that needed for tarred slag or granite, and labour for mixing will not be less than that required for the harder materials, the question of durability has to be carefully weighed against the cheapness of clinker. True economy can only be obtained by a careful consideration of all the local circumstances, and the experience of the surveyor and a good knowledge of local circumstances must be the main factors in arriving at a decision as to whether it is true economy or not to use cheap or more costly materials.

DESTRUCTION OF ROADS.

At the annual meeting of the Institution of Municipal and County Engineers held at Blackpool last year, two very interesting and practical papers on roads were read by Mr. Arnall, of the city engineer's department, Birmingham, and Mr. W. H. Schofield, county surveyor of Lancashire. Mr. Arnall's paper was a departure from the general run of road papers, and for that reason was the more valuable and interesting. While many papers have dealt with the constructive side of road making, very few have dealt with the

from the purely destructive side, as Mr. Arnall's paper on "The Destruction of a Macadam Road" does. It is very necessary that we should know the factors which make for the destruction of our roads if we are to be able to lay them with a reasoned confidence in their durability.

Attention was called to the great amount of interstitial wear which takes place in a road, and which is shown by the rounded condition of the stones found when a macadam road is picked up or scarified. The depth of the material at which the interstitial wear ceases will depend upon the weight of the loads and the character and width of the tyres. This internal attrition is found to be very much less in tar-macadam or bituminous roads, in which the tar or bitumen fills up the interstices better than is the case with ordinary macadam, and provides a resilient cushion which absorbs the surface shocks. The importance of using various sized stones so as to prevent voids, and the necessity for keeping water out of tar-macadam were also pointed out. Water is the great enemy of the tar-painted or tar-macadam road. Dampness, on the other hand, is good for ordinary macadam roads, but too much wet destroys all the cementing properties of the binding material, and this is especially the case with stone or binders having clay in their composition. Clay, being greasy, moves about under the weight of heavy traffic, and leads to a corrugated surface. Weak tar has somewhat the same effect, and wave action and corrugated surfaces are much more common in tar-macadam roads than in ordinary macadam.

POTHOLES.

Potholes are a source of annoyance to most surveyors, for they occur in nearly all roads. They are generally started by the action of horses' hoofs, coupled with weakness in the road due to unequal density of material or imperfect rolling. A road made of varying density, especially where the stone used is of small sizes, frequently goes into a series of potholes soon after it has been made. Though more often met with in macadam and tar-macadam roads, they are also to be found in wood paving and asphalted roads, due in the case of wood setts to soft or improperly seasoned blocks giving way, and in the case of asphalt to depressions caused by wave action or corrugation.

In Mr. Arnall's opinion it is the hammer-like action of wheels when they meet a depression in the road, which makes the wheels bump and jolt, that causes the potholes. The friction of rubber tyres on roads, he says, is enormous, causing the rubber to grip the stone and carry it along with it. The stones in front are pushed forward and outwards at the sides, until the axle comes over any one of them, then the movement is reversed, and the stones in the centre are gradually pulled back, and those at the sides inward; but the trouble is that they have all been displaced, and no stone is pulled back into its old place. They are merely disturbed, left loose, and the surface is disintegrated, the stone being "shaken out" rather than "sucked out" by the tyres. The remedy is constant attention and repairs to these holes as soon as they appear, and this can only be done by a consolidating material of a bituminous character.

The ease with which tar-macadam can be used to repair holes in ordinary macadam has led to its very general adoption, but care is required in doing this to see that the holes are well cleaned of small grit, are dry, and filled with fairly large material so as to avoid undue shrinkage or consolidation. Though this method is easy and effective for a time, it is not always successful or economical. The tar-macadam is of a denser character than the surrounding macadam, and in a short time the old material goes into holes, and the last state is very much worse than the first.

An interesting point brought out during the discussion on this paper was the great difference in the wearing value of stone in the form of setts and broken up as macadam. Mr. Gullan, of Belfast, said that a sett would last ten times as long as it would if broken up as macadam, and that sealing the voids with a bituminous binder gave a life of five times the life of ordinary macadam. That was because the stone was held up to its work. This view was endorsed by Mr. Arnall, who said there were granite-paved roads in Birmingham which had been down for fifty years. They were 6-in. setts, and had not worn half an inch. If it had been put on as broken stone they would have had to put on 3 in. to 4 in. every year and cart it off as mud. They would have had to put 10 ft. of stone on the road in that time in little bits, and scrape it off as mud.

IMPROVEMENTS OF HIGHWAYS.

The paper by Mr. Schofield on "Improvements of Highways to Meet Modern Traffic" was on somewhat different lines, but equally interesting. In calling attention to the great growth of the heavy mechanically propelled vehicles, he is able to speak with the weight of his large experience of the heavy Lancashire industrial traffic. Despite the Government's commandeering of all the heavy motor wagons that were being made when the war broke out, and many of those in actual use, or that have been built since, Mr. Schofield said that on many of his main roads the heavy motor vehicles are now 60 per cent more than they were before the war commenced. On the Manchester and Liverpool road the increase during the past five years had been sevenfold. The effect of this increased heavy motor traffic on the rural roads is disastrous, as they were never constructed to carry such heavy loads and at such high speeds as these vehicles travel at. It is found that most drivers take advantage of the clearer roads in the country, and the less risk of detection, to try and make up for the restricted speeds in the large towns by travelling above the regulation speed when they get on the country roads.

Some interesting figures were given by Mr. Schofield as to the cost of the reconstruction of these rural roads, so as to make them fit to carry present-day traffic. He estimates the cost of the hand-pitched rubble foundation, which is used on most of the main roads in Lancashire in the neighbourhood of large towns, with a 4-in. coat of tar-macadam and a 5-in. by 12-in. gritstone edging, at nearly £2,000,000 for the 350 miles of rural main roads. This payment, spread over ten years, would cost £686 per mile, apart from the cost of maintenance. Such a cost is prohibitive for most rural main roads, and the foundation is therefore dispensed with, and a 4-in. coat of tar-macadam is relied on at a cost of £3,200 per mile.

The millstone grit setts, which could formerly be relied on to carry the traffic, are now found quite inadequate to carry the heavy loads on the main roads between the docks at Liverpool and Manchester and the large number of industrial towns in South Lancashire. Even granite setts on concrete are badly spalled by the iron-shod wheels of these heavy vehicles, and it is necessary to bed the setts on a more resilient foundation than concrete, ashes or tarred chippings being generally used. The need for the use of rubber tyres instead of iron-shod wheels was generally admitted in the discussion which took place on this paper.

TAR MACADAM.

The question of the best material for tar-macadam again cropped up, with the usual division of opinion as to the merits of granite or slag. Mr. Schofield and Mr. Hadfield, of Sheffield, both preferred slag, while Mr. Finch, the county surveyor of Cumberland, and other speakers preferred granite. We dealt with this matter so

fully in our last Annual Issue that we must content ourselves with pointing out that the personal factor appears to be the chief cause of success or failure. Both materials have been laid with the greatest success in all parts of the country, and both have met with disastrous failures. To get the proper consistency of tar required in all situations is very difficult, and when got, unfortunately, it is not always used intelligently. Too much or too little tar, too damp or over-heated stone, may cause the best of stone and tar to be a failure. Good roads can be made with both materials by an experienced and careful man, though it does not follow that they will be suitable for the heaviest motor traffic. Granite or wood setts on a concrete foundation are still the best, and, on the whole, the most economical for our heaviest trafficked roads.

At a meeting of the Institution of Municipal and County Engineers held at Hull, Mr. Bricknell, the city engineer, stated "that the tractive effort required on a water-bound road is about half that on tar-macadam." This statement was questioned by several speakers who took part in the discussion on Mr. Bricknell's paper, Mr. Wakeford going so far as to ask, "Was that what Mr. Bricknell meant, or should the statement be reversed?" Most surveyors who have had any great experience with tar-macadam are aware that under certain conditions tar-macadam requires much greater tractive effort than ordinary macadam. It is, however, difficult to generalise without falling into error. The greater or less tractive effort required depends upon the quality and quantity of the tar used. If the tar contains too much of the lighter oils, or too much tar is used, it is bound to work up under heavy traffic or in a hot sun, and this necessitates greater tractive effort. There are, however, many slag and granite tar-macadam roads which have such a hard and clean surface, and are so free from any tar trouble, that the tractive effort is unquestionably less on them than on an ordinary macadam road. It has often been pointed out in these columns that it is difficult to get a standard tar fit for all situations, and the personal factor is nowhere more important than in the making of a tar-macadam road.

REPAIR OF ROADS IN HALF-WIDTHS.

Another matter of great practical importance which has been discussed in our columns during the past year is the question of repairing roads in half-widths. The discussion arose on a statement made by Mr. W. W. Gladwell, surveyor to the Norfolk County Council, who said "he had seen many examples of the work" (repairing roads in half-widths), "but had never seen a good one. He hoped he should never be asked to do it, as good results could not be obtained."

This opinion was challenged by a number of well-known surveyors, and, while everyone would prefer to repair the whole width of a road at once if it were possible to do so without causing inconvenience or danger to the public, most surveyors find that with ordinary care they are able to repair a macadam or tar-macadam road in half-widths which shows no signs of the joint, and develops no weakness where joined. Most surveyors leave the margin of the half-width in the centre of the road unrolled and bevelled off until they are ready to join up with the other half-width of the road, and with care do so with perfect success. Even if there are occasional failures due to want of care or inexperience, the public convenience and safety will not permit roads to be blocked for any length of time in these motoring days.

CONCRETE ROADS.

Concrete roads do not make much headway in this country, though their use in America is increasing at a surprising rate. Probably the war is largely responsible for this failure. In such a wet season as the past it ought to have been possible to make roads of this material with a greater chance of success than tar-macadam roads. Mr. Matthews Jones, who was one of the first road engineers to use this material for surfacing roads, said, in the discussion on Mr. Arnall's paper at Blackpool, that granite must be bound with some material that would keep it in position, and that cement was better than tar for this purpose. He said there were no potholes in the concrete roads he had constructed four years ago, but in reply to Mr. Wakelam he admitted that the traffic on these roads was very light—some 80 to 120 tons per day. This hardly affords a basis for judging the wearing capacity of concrete, for many tar-macadam roads carrying much heavier traffic have been down twice as long and still remain in good condition.

Mr. Chapman, whose experiments with concrete roads on the London to Dover road promised to be so useful to engineers, said the traffic on this road was 1,000 tons per twenty-four hours, and, as they could not close the road while the experiments were being made, the 1,000 tons was concentrated on the 10 ft. of road left open. As a result the concrete was badly damaged through the heavy traffic. "Tar-spraying, which Mr. Jones applied to his concrete roads, would not be very successful if he applied it to a road carrying any traffic," was Mr. Chapman's opinion. Tar serves the very useful purpose of keeping down the dust and filling up the ugly cracks found in so many concrete surfaces. An interesting statement made by Mr. Chapman was that rough-graded concrete (6 to 1) would not stand the compression of exceedingly heavy traffic, and was not a success, but a richer concrete (3 to 1) was as good as when it was first laid.

Of more than passing interest to road engineers is the proposal to construct a reinforced-concrete causeway, 20 miles long, to connect Ceylon to the Indian mainland, at a cost of £740,000. Of this 20 miles, 7 miles would be on the dry land of the sand banks or islands, and 13 miles in the sea, carried on reinforced-concrete piles. The piles would support concrete slabs as sheet-piling, which would be filled in with sand to provide a causeway 6 ft. above high-water mark.

ROAD SERVICE IN FRANCE.

The Government's appeal in November last for road engineers and roadmen to join a Road Battalion for Service in France, under Mr. H. P. Maybury as Brigadier-General, met with a splendid response so far as the engineers were concerned. Many engineers who had been hitherto barred from giving their services to their country, owing to being over military age, or through their councils refusing to let them enlist, gladly offered their services. Far more volunteers were found than it was possible to provide with commissions, and some disappointment and considerable inconvenience has been experienced by many men who had obtained the sanction of their councils to go to France, and then found that their services were not likely to be required. The ungenerous suggestion has been made in some quarters that it is owing to the Road Battalion being a non-combatant corps that so many have volunteered to serve in it. This is extremely unfair, for when we have universal service there must be a good reason why men, and especially young men, are not in the Army. It has been in many cases a cruel blow for a young fellow to find himself medically rejected, often on trifling grounds, or, what is even more galling still, to find his council or his chief refusing to let him go into the Army on the ground that they considered him indispensable. We are quite sure that the men who have joined this new battalion

and are to have charge of the construction and maintenance of the roads required for use by the British troops in France, are as patriotic and self-denying as those men who are already fighting in the trenches, and that their work will be as necessary and important as fighting. They will have to face the discomfort and hard work of campaigning, and they deserve the sympathy and good wishes of all who stay at home. We feel sure that they will not only do very useful work, but will add fresh honours to the profession of the municipal engineer.

HOUSING.

The housing problem has been very much under discussion during the past twelve months, owing to the conditions created by the erection of so many munition works in different parts of the country. Large additions have been made to the existing industrial populations of many of our towns, and in other cases large communities have had to be provided for on sites far removed from the old industrial areas. The Government, who have through the Ministry of Munitions practically stopped all building, except for munition works, and stopped nearly all loans for public works, have recognised the need and importance of housing schemes by sanctioning loans for the year 1915-16 of £554,328 for housing munition workers in various centres. This is practically half of the whole sum sanctioned for loans for all purposes. This sum is, however, quite inadequate to meet the needs even of the munition workers, and does not provide for the needs of the mining, woollen, boot, clothing, and other industries, which have been extremely busy producing goods which are as necessary for the proper carrying on of the war as the making of munitions.

The reason for the scarcity of houses is too well known to call for much comment. While recent legislation had for some years before the war been the most important factor in stopping speculative building, the greatly increased cost of labour and materials since, and the rise in the rate of interest, had practically given it its death-blow before the Minister of Munitions issued orders that no building costing over £500 was to be built without being sanctioned by his department.

Whether it would be possible to build cottages to-day at a profit, even if labour and materials were forthcoming, is very doubtful; but with labour and materials practically all commandeered for munition works and the accommodation of munition workers, it is very evident that the provision of cottages must either be carried out as a Government measure or by a company or community in receipt of a Government subsidy.

The need for cottages is felt throughout the country, though it is most pressing in munition and mining centres. In the South Wales coal-field it is said that 25,000 houses are wanted at once, and that 10,000 will be required after the war. At Swansea there are 1,000 persons with their names on the house-agents' books waiting for houses which are not likely to become vacant until after the war. At Woolwich, where the Office of Works have erected houses to accommodate 1,300 families on the Well Hall Estate, it has been found necessary to supplement this accommodation by building 2,000 huts, and providing hostels for women workers. The demand for houses in Carlisle, caused by the workers from Gretna, has forced up the rent for cottages from 3s. 6d. to 10s. per week. In Huddersfield, where Messrs. Dyer, Limited, have erected works to employ from 20,000 to 30,000 hands, it has been found necessary to house the latter in wooden huts. At Sheffield a Housing Committee has been appointed to deal with the housing question, and the Tinsley Committee have had to find accommodation in the adjoining towns and villages. In Barnet, Coventry, and many other places similar urgent need exists.

It is very evident that although these munition works are of a temporary character, many of them are likely to become permanent, and the question will have to be faced as to how they are to be dealt with in a satisfactory and economical manner. In Glasgow the city council have built a block of twenty-four single-roomed tenements in the Calton area, which they have furnished and let at 6s. per week to provide temporary shelter for married couples.

COTTAGE *v.* TENEMENT.

The superiority of the cottage over the tenement is now generally admitted in England, but it is still disputed in many influential quarters in Scotland. Sir John Lindsay, the town clerk of Glasgow, presiding at a housing conference, said he preferred the Scottish tenement to the English self-contained house, and, although he was told by a speaker who followed him that "if he preferred a tenement he should live in one," and another speaker said they "ought to thank the town clerk for his very interesting and *misleading* address," he still stuck to his guns, and a resolution in favour of cottages had to be withdrawn. Mr. Jas. Thomson, the city engineer of Dundee, said "London people did not know what a tenement was." On the other hand, Mr. Ross Young, the town planning engineer for the Middle Ward of Lanarkshire, who should know what a tenement is, considers the Scottish tenement "a national blunder," and says "the death-knell of the tenemental system should be pronounced as speedily as possible."

In England the tenement or block system is confined to London and a few of our larger towns, but few housing experts favour it if it is possible to erect cottages in the district economically. On expensive sites everyone recognises that cottages cannot be erected to let at an economic rent. It is only dear land which makes a builder erect these huge barracks, and we rarely find an English local authority adopting the tenement system in these days. The greater thickness of walls, the loss of floor space, the increased cost of labour as one gets higher, the inconvenience and loss of time to tenants, and the absence of privacy, offset the cost of a greater quantity of land and the increased road charges and cost of fencing which are necessary in the self-contained cottage or villa. Wherever land is fairly reasonable there is no excuse for tenements.

A STATE DUTY.

It is, however, necessary to recognise that private enterprise is not likely to provide a tithe of the cottages required for housing the workers of this country, and that the State must step in and build the cottages or assist the local authorities to build them by advancing money either free for a time or at a low rate of interest for a long period. Mr. Walter Long, M.P., before he left the Local Government Board, in meeting a deputation from the Housing and Town Planning Congress, agreed that the sum of £20,000,000, which the Government was asked to set aside for the provision of working-class houses, might not be sufficient to provide the decent homes which it was the duty of the nation to provide for our soldiers when they came home. It is estimated that 400,000 cottages are wanted immediately, and of this number 120,000 are wanted in the rural districts.

The question of cost is a very important factor, which will vary considerably according to the locality in which cottages are built. Thanks to Government assistance, the Irish cottager has a

comfortable and sanitary cottage provided for him at a rent of from 1s. 2d. to 1s. 4d. per week, and the buildings compare very favourably with any cottages provided by an English or Scottish authority. In these countries the rents vary from 3s. 6d. to 10s. per week, but the cottages are generally larger and better built than the Irish cottages, though the difference in cost does not represent a difference in value from the point of view of accommodation.

BY-LAWS REVISION.

Many demands have been made by architects and builders for a revision of the building by-laws so that cheaper cottages may be built. While many municipal engineers sympathise with the desire to cheapen building, the great majority feel that on sanitary and constructional grounds it is very difficult and somewhat dangerous to make any sweeping alterations in the by-laws relating to new streets and dwelling-houses.

At Sheffield a committee appointed to consider the revision of the by-laws have recommended a number of alterations and variations for the period of the war and for two years after, and that before the expiration of this period it should be considered whether the alterations made should become permanent. The main alterations which they recommend are to allow certain party walls under 30 ft. high to have a thickness at the lowest floor of 8½ in., instead of 13 in., and to reduce the thickness of the external walls of water-closets from 8½ in. to 4½ in., if the brickwork is built in cement. The sizes of the timber are to be left to the builder, subject to the sizes being satisfactory, presumably to the surveyor or building inspector. Skylights in attics are accepted as windows, instead of requiring a vertical dormer window. Windows in water-closets are unnecessary if sufficient light and ventilation can be obtained otherwise. The committee suggest that further economies can be made:—

(1) By omitting cellars and substituting pantries and coal-houses on or near the ground-floor level.

(2) By the use of reinforced-concrete walls.

(3) By making the height of the rooms on the first floor to be 7 ft. 6 in. at the eaves.

(4) By using asbestos slates for roofs, instead of slates.

The Local Government Board of Scotland are erecting in the Vale of Leven three-room-and-kitchen cottages in concrete, with external walls 3 in. thick, strengthened at intervals with 9-in. piers. Another experiment is the erection of concrete cottages with hollow walls, consisting of 2⅜-in. and 3-in. concrete slabs, with a 3-in. cavity. The slabs are rough-cast outside and plastered inside, and the cottages have slated roofs. Standardisation of doors, windows, and fittings, and building in sufficient numbers, must be adopted if cheap cottages are to be erected. Where slag heaps or gravel pits are plentiful, concrete cottages should be built cheaply, and where neither slag nor gravel can be obtained easily, there are many places where clinkers can be used with satisfactory results, both from a constructional and economic point of view.

SURVEYORS AS ARCHITECTS.

In the last of the interesting lectures on town planning, which he has recently delivered at University College, London, and which we reproduced in our issue of January 5th of this year, Prof. Adshead insists that housing will never await town planning, and that local authorities, without waiting for the promised Government grant, should prepare a comprehensive plan of their areas, so that they can find sites for cottages without completing a detailed town planning scheme. This is sound advice, and will doubtless be followed by the majority of the surveyors who are likely to have to prepare housing schemes. He proceeds, however, to have the usual architect's fling at the capacity of the surveyor and his staff who may be called upon to prepare such schemes. He says: "I presume that if permission were granted *the surveyor and his staff, who are certainly not qualified to undertake such work*, would at once set about and make the plans." He then proceeds to say that his own view is "that we want a standard cottage, or two dozen standard cottages, prepared by a Government department in conjunction with the big building trade manufacturers and builders, and with the best architectural advice, and adapted to garden city principles. *The local authorities, most of whom are quite incapable of preparing a design for a cottage*, should only be empowered to adopt these, and that should be a condition of the grant."

To deal with the last portion of the Professor's views (which have the true Teutonic autocratic and dogmatic ring) first, one wonders how he will fare at the hands of his brother architects, who are always ready to protest against anything in the shape of official design and standardisation as destroying originality, and incidentally depriving them of their fees. In our last Annual Issue we called attention to the heartburning caused in the architectural world by the Government doing the very thing which Prof. Adshead now advocates. The designs published by the Government in 1915 for rural cottages were met with a strong protest from the Society of Architects, and were stigmatised as "stockpot" designs in the architectural Press. The Government not only did not heed this protest, but administered a well-merited snub to the architects by telling them that most rural cottages were designed by land agents and surveyors, and they were not inclined to determine that none but architects are qualified to do this work.

To turn to the Professor's statement that the surveyor and his staff are not qualified to design a cottage, we consider that the many housing schemes which we have illustrated in our columns during the past year clearly disprove such a statement. It is true that they may not possess the artistic merit of the Georgian houses designed by Prof. Adshead for the Prince of Wales at Kennington, but a sense of fitness and a proper regard for economy would naturally prevent any municipal surveyor from adopting the style and materials which the Professor thought fit to employ for his distinguished client. One would hardly expect the average cottager to appreciate the Ionic pilasters, neo-Grec ornament, domed turret, and fountain and statuary, which rescue the Kennington buildings from the commonplace, every-day type of building they otherwise would have been. The style is one of "studied simplicity," but a simplicity which is certainly not economical, for, like a well-cut coat or a tailor-made gown, such simplicity costs more than far more gorgeous clothes or elaborate designs.

Circular-headed windows and geometrically curved window sashes, traceried verandahs, ornamental ironwork balconies and doorways, and classic porches and balustrades may be Prof. Adshead's ideas of what is suitable and fitting for a working-class dwelling, but the surveyor who was foolish enough to present such a design to his council would soon have to look out for another post.

Prof. Adshead is generally so fair and broad minded that we cannot help thinking he has suffered a temporary lapse from his usual genial manner. Surveyors are not constantly reminding him and other architects who wish to monopolise town planning that they would be better employed on their own special work of building than talking very large about such engineering works as roads and bridges. Municipal engineers recognise that

[illegible] architects who may know some [illegible] of these engineering problems, just as some surveyors can be trusted to design a housing scheme which will not offend the artistic proprieties, and can be relied on to prove convenient and economical.

MUNICIPAL BUILDINGS.

The [illegible] of the building trade have practically put an end to nearly all kinds of municipal building. Several important buildings have been completed during the past year, but very little new work was started, and that only of an urgent sanitary character, for housing, or for providing light or power for munition works.

Early in the year the need for men for erecting munition works caused the Ministry of Munitions to stop work on the new London County Hall. No patriotic citizen can object to the men being taken away, even from such an important building as this, if they are required for work of so much more pressing national importance as that of erecting munition works. Everything else must be subordinated to winning the war, and, though many people will regret the stoppage of this and other important buildings, such as the London Water Board offices, none will question the decision of the Minister of Munitions acting as he has done at such a time.

Hospitals probably come next in importance to, even if they do not rival, the munition works, for the proper treatment and housing of our sick and wounded soldiers must take precedence of any building which is merely concerned with the civic amenities or the sanitary needs of the stay-at-home public. The process of converting some of our finest mansions and largest hotels into hospitals has been continued, and the Duke of Westminster's palatial country seat, Eaton Hall, and the Star and Garter Hotel, Richmond, are among the latest buildings to be used as hospitals. The very fine town hall for the Wallasey Council, which was completed during the past autumn, has also been devoted to hospital purposes. At Brentford a war hospital of a temporary character to accommodate 1,200 beds has been erected. New infirmary buildings, erected at a cost of £18,000, were opened at Nuneaton last April, and a new infirmary, accommodating with staff 175 persons, was opened at Eye, Suffolk, in September last.

BATHS AND WASH-HOUSES.

Several baths have been completed and opened during the past year. Among these may be mentioned the reconstruction of the Royal Baths at Bath, which were opened by Field-Marshal Lord French in February last. These buildings include three deep baths, two being fitted for chairs, three [illegible] for special douches, six for massage, [illegible] and a plumbers room. The buildings are splendidly fitted up, and many new features have been introduced. The steps in the deep baths are of aluminium, the corridor, bath-rooms, and dressing-rooms are paved with black and white [illegible] tiles, and the walls are covered with [illegible]. The entrances have been modernised and the lighting improved, and as the fee has increased the number of persons requiring medicinal baths while it has eliminated foreign competition, the enterprise of the corporation will no doubt meet with the success it deserves.

Most English coast watering places have not been very busy during the war, largely owing to the closing of Continental resorts to English visitors and the disinclination to travel in such disturbed times, when most persons needing treatment naturally feel. It will be a very long time before the German and Austrian spas recover their popularity with the people of the Allied countries. One leading inland watering place, however, has taken splendid opportunity of bringing their bathing facilities and the medicinal qualities of their baths before the visiting public, and to the great credit of the majority they have not failed to make good use of their opportunity. Not only has Bath reconstructed her baths, but she has had prepared a splendid scheme for reconstructing the centre of the city, which if carried out will greatly increase the popularity of the town as a health resort.

Baths of a somewhat different character were opened last season at St. Annes-on-the-Sea. The fine open-air salt-water baths which the council have constructed on the shore have been immensely popular, and nearly £3,000 was taken in them during the past season. The bath, which is described and illustrated in our issue of July 7, 1916, is 240 ft. long and 120 ft. wide. It has proved at times none too large adequately to accommodate the large number of bathers using it. Greater dressing accommodation is to be provided in the near future, and other improvements are to be made. It has attracted a large number of visitors to St. Annes, and has given a fillip to the schemes of its neighbours to the north and south. After the war two much larger bathing pools are to be constructed at Blackpool, and Lytham proposes to construct one 350 ft. long and 120 ft. wide.

The new Portland Baths at Nottingham, which have been erected on the site of the old tram stables from plans by the city architect, Mr. A. Dale, have a swimming pond 100 ft. by 30 ft., sixteen private baths for men and seven for women. The diving stage is built on the model of that in use at the Royal Automobile Club in London, and the sixty-seven dressing-boxes are collapsible, so as to give more seating room at galas, or for adapting the bath for public meetings and entertainments in the winter.

Another interesting building opened this year is the public wash-house erected by the Edinburgh Corporation at McLeod-street, at a cost of £6,500. It is the sixth public wash-house erected by the corporation, and is said to be the last word in wash-house construction. It has a washing-hall 80 ft. long by 35 ft. wide, and there are forty washing-stalls, with room for sixty more. Several features introduced have a sociological as well as engineering interest. The entrance hall has a large waiting-hall for women, with space for perambulators, &c., and a crèche is provided where young children will be taken care of while their mothers are washing. Each washing-stall has a boiling-trough, washing and rinsing tub, and drip-table, and each group of stalls is provided with steam-driven hydro-extractors. Mr. Jas. Williamson, A.R.I.B.A., the city architect, prepared the plans and supervised the erection of the buildings.

The Bournemouth Corporation are going to make a bold bid for public favour after the war, as they have had plans approved by the Local Government Board for a new pavilion to cost £5,000, which they hope to build as soon as the war is ended.

SCHOOLS.

Very few schools have been built or completed during the past year, but among the largest is that of the Stockport Grammar School, which has been completed at a cost of £37,000.

PUBLIC ABATTOIRS.

"Public Abattoirs" was the title of a paper by Mr. H. A. Brown, engineer and surveyor of Weston-super-Mare, presented to the annual meeting of the Institution of Municipal and County Engineers at Blackpool. Mr. Brown in his paper compared British and Continental

practice much to the disparagement of the British authorities, and his eulogy of the German abattoirs called forth a sharp protest by a correspondent in our columns. We do not in this country make such a fetish of our stomachs as the Germans do, and it certainly strikes British engineers as being out of place to erect palatial buildings for pig-slaughtering. The beer-halls which are to be found in the German abattoirs do not appear to be likely to be adopted in this country in these days of public control, or commend themselves to the ordinary citizen as being conducive to humane and careful slaughtering. The plans, while having many good points, are open to serious criticism both on the grounds of sanitation and convenience, while in nearly all the Germans appear to pay little regard to economy.

The plans of the Weston-super-Mare abattoirs, which were illustrated in our last Annual Issue, show a great improvement on those for the German abattoirs, and Mr. Brown must be congratulated on having avoided the pitfalls so plentifully exhibited in the Continental plans, which are applied as a standard in a cast-iron manner for all sizes of buildings irrespective of their actual requirements.

MISCELLANEOUS.

In our columns of May 5, 1916, we illustrated the Hardinge Library at Delhi, which was opened in March last by the Viceroy of India. The buildings, which were designed by the city engineer, Mr. T. Salkield, M.INST.C.E., are of a pleasing character, and the avoidance of the fussy ornament which so many architects feel it necessary to employ enhances its charm. The style is a happy combination of Oriental and Classic architecture, and Mr. Salkield warmly deserved the congratulations offered him by the Viceroy at the opening of the building.

Much regret was felt at the destruction by fire of the Canadian Parliament House at Ottawa early in the year. These buildings, which were erected at a cost of £1,000,000 sterling, are to be reconstructed as far as possible on the same lines.

The proposal to hold a competition for the Federal Parliament House to be erected at Canberra for the Australian Government called forth a strong protest from the architects of this country and France. Eight prizes, ranging from £2,000 to £250, were offered, but it was pointed out to the Australian authorities that they could not expect to get the best schemes at such a time as this, when the ablest of the younger architects of all the Allied countries were fighting in the field, and the older men were busily engaged on war work. Though the Australian Government were disposed at first to override these objections, they ultimately agreed to postpone the competition until after the war.

REFUSE DISPOSAL.

The necessity which has arisen owing to the war of avoiding expenditure not absolutely essential, and at the same time doing everything possible to prevent waste, has had considerable influence upon the work of refuse disposal during the past year. No new destructor works have been erected, so far as we are aware, but in one case, described in our pages, where no provision was made in the original scheme for the complete utilisation of the waste heat from the furnaces, the question of installing a steam pump for raising the sewage is now under consideration. By this means the day flow of sewage will be pumped without cost for power, leaving the night sewage only to be raised by the existing oil engine.

This is, however, a comparatively small matter. Much greater advantages will probably be derived from the efforts which have been made in various directions to convert ordinary town's refuse into useful commodities instead of destroying it by burning or dumping. One method has been in use in a few places for some years, and that is the conversion of refuse into manure by means of the Patent Lightning Crusher. The adoption of this system is extending, and we understand it is giving satisfaction in all cases. A scheme for the reduction of the garbage of New York indicates the possibility of very favourable results, both financially and from the sanitary point of view. It is estimated that the nett operating profits will exceed £100,000 per annum. The chief by-product is grease, which is extracted by cooking the garbage in a closed steam-jacketed vessel called the reducer. A somewhat similar apparatus has been adopted in certain places in this country for dealing with the contents of swill-tubs, sometimes known as hog-wash. In these cases the saleable products include not only grease, but crushed bones and poultry food. We think that more will be heard of this method of recovering value from waste products after the war.

In a number of places local authorities have requested the householders to burn as much as possible of their refuse in their own kitchen grates, and this is undoubtedly desirable in view of the present scarcity of labour. On the other hand, it is evident from articles which have appeared in our columns that town's refuse can be utilised in various ways. For a number of years past the clinker from the refuse destructors at Ealing has been used in the manufacture of paving slabs for footpaths, and these have proved thoroughly durable. Elsewhere the utilisation of clinker has been carried still further. In an article which appeared in these pages on December 8th last, Mr. L. D. Lewis, engineer and surveyor to the Abertillery Urban District Council, referred to a thoroughfare in his district which is made up entirely of clinker products. The kerbing is formed of clinker concrete, the footpaths of clinker paving flags or tarred clinker, and the carriageway of clinker Mexphalte, no channel stones being required, as the Mexphalte is laid right up to the kerb.

The article in question deals with the use of clinker Mexphalte for the surfacing of roads, and it is interesting to note that this material was invented by that eminent municipal engineer Mr. E. J. Lovegrove, of Hornsey. The advantage gained by the use of this material, which has a bearing upon the subject of refuse disposal, is that it affords a definite and profitable use for refuse destructor clinker, as 80 to 85 per cent is used in the process. There are other advantages connected with the use of this material, but these relate more to the matter of road construction than refuse disposal. It may, however, be noted here that Mr. Lewis was particularly struck with the resilient properties of the clinker Mexphalte, and he believes that time will reveal that this type of road will be found to outlast other more costly methods of road construction adopted to withstand heavy traffic. Similarly good results have been obtained by the use of this material at Wolverhampton, as described in an article in these pages on October 13th last, where it is stated that Mexphalte is particularly suitable for use with destructor refuse, as it enables engineers to find an outlet for the disposal of their clinker, which is often a troublesome and expensive matter, and at the same time enables them to provide a road surface which meets the requirements of modern traffic.

An interesting article on the utilisation of house refuse, by Mr. Reginald Brown, M.INST.C.E., engineer and surveyor to the Southall Norwood Urban

District Council, was printed in our issue of October 27th last. After referring to the wastefulness of disposal by tipping and the use of clinker with Mexphalte for road surfacing, the author deals with the calorific value of refuse, and describes his invention for producing fuel from it. The refuse is reduced to a powder by crushing, the powder is impregnated with a binding material, which both increases the calorific value and also destroys all organic matter, and the impregnated powder is compressed into briquettes ready for use as fuel. A similar method of utilising ashbin and other refuse was described in detail by Mr. H. G. Cooke, engineer and surveyor to the Market Harborough Urban District Council, in our issue of December 1st last. The briquettes, which in this case are given the name of "coalesure," are estimated to evaporate from 3½ lb. to 5¼ lb. of water per pound of fuel, and to leave from 10½ to 16 per cent of incombustible residue according to the grade, and to cost from 1s. to 9s. per ton to manufacture. If they can they could be sold at from 6s. to 11s. per ton, they would provide a cheap form of fuel with some profit, to which must be added the cost for disposal of the refuse which would be incurred if it were not utilised for making briquettes.

Another source of revenue from refuse in at least one case was the conversion of fish refuse into manure. At Bradford, Yorks, this manure was sold at prices varying between £6 and £9 10s. per ton. At these prices some profit remained, but much better financial results are anticipated under normal conditions after the war.

In conclusion, reference must be made to the process for the utilisation of disused tins from refuse heaps, which is being exploited by the British De-Tinning Company. Prior to the war, a considerable quantity of disused tins was exported to Germany, and this trade has now been taken in hand by the above company, who have already entered into contracts with three large boroughs for the erection of works within their borders. The pure tin is extracted from the metal and the residue is used for the manufacture of small articles of general utility for which it is suitable.

From the foregoing notes it will be seen that there is much scope for the prevention of waste, even in connection with such an apparently unpromising material as house refuse, and it is to be hoped that the efforts in the utilisation of waste products which have been engendered by the special conditions caused by the war will not be relaxed in peace time.

SEWERAGE AND SEWAGE DISPOSAL.

Owing to the restrictions which have been placed upon the execution of all work which is not essential to the carrying on of the war, there is nothing of importance to record in connection with the construction of sewers, and for developments in connection with sewage disposal we have to rely chiefly on work done in the United States. It is true that a considerable amount of work has been carried out in connection with new camps and munition works, but no details of construction or of results obtained have been made public, and cannot therefore be discussed on the present occasion. We look forward to the time when this will be possible, as there should be much to be learnt, even if only how *not* to do things. We mention this point for the reason that, from a report which was published in the daily Press, it appears that the pollution of rivers by sewage is increasing in places, and it would seem that the standards for sewage effluents which were previously considered necessary have not been adhered to in some of the new works. It will be interesting to know in due course whether this has been due to defects in design or construction, or to bad management, or even to negligence. It will not surprise us if it is eventually found that the last-mentioned is the cause of the trouble in most cases.

The general tendency has always been to treat sewage disposal works with indifference and neglect until serious trouble arises and compels attention. Even when they are not left entirely to themselves it frequently is the case that the management is left to a totally inexperienced man. At the last annual meeting of the Association of Managers of Sewage Disposal Works it was stated that many members of the association had been appointed to take charge of sewage works under the Government. This is good so far as it goes, but in our view it suggests that many of the new works constructed for the Government were by inexperienced engineers. If the matter is considered of sufficient importance to call for comment except in the light of hindsight, there would have been better prospects of securing satisfactory results all round. We fear it will be a long time before Government officials and members of local authorities will learn that a modern sewage disposal works is entitled to a place of dignity and importance, requiring regular and careful attention on the part of a manager possessing a considerable amount of technical knowledge and practical experience.

SPECIAL CONDITIONS OWING TO THE WAR.

As may be imagined, the provision of systems of drainage, sewerage and sewage disposal works required for the accommodation of troops and munition workers all over the country has created many exceptional difficulties, and has involved the consideration of varying conditions of all kinds. The sites were not always selected with a view to the best means of dealing with the sewage. In some cases the available fall has been insufficient for gravitation and the sewage has had to be lifted. In others the fall has been more than sufficient. At the outset everything was sacrificed to speed, with the inevitable result that the cost of the work was increased enormously. Then again there was the impression that in many cases the accommodation would be of a temporary character, and it was assumed that drains and disposal works of a similar nature would be sufficient for the purpose. When the "temporary" accommodation had been in existence a few months, with every appearance of its being required for years, it was soon made obvious that "temporary" sanitation is impossible, except for troops engaged in actual field operations, and fresh works of a permanent character had to be provided.

Sufficient is known of this work to enable us to state that, while most of the sewage works have been designed on well-known principles of the ordinary kind, in some cases attempts have been made to apply the latest scientific knowledge available with a view to economy and with some measure of success. From the foregoing it will be seen that there have been great possibilities of acquiring new experience under varying conditions, and we hope that when peace comes this will be made public for the benefit of all those who are interested in this branch of engineering.

SANITATION FOR TROOPS ON ACTIVE SERVICE.

While the conditions of life in the trenches and immediately behind the firing-lines have been described by many war correspondents and other writers who have visited the various fronts, these reports have for obvious reasons contained no information as to the methods of sanitation in vogue in such places. Our readers are therefore

under an obligation to Mr. N. W. Hoskins for the interesting particulars given in his paper, which we printed in our issues of December 8th and 15th last. It will be seen that, in addition to the discomforts of exposure to all kinds of weather, the difficulty of obtaining regular cooked meals, and, of course, the danger to life from many sources, our gallant troops in and near the firing-line have to submit to many inconveniences and discomforts from the lack of proper sanitary arrangements. Everything that can be done under the circumstances is done to secure the best possible sanitary conditions, but at their best these are far removed from those to which the men were accustomed before they entered on military service.

UTILISATION OF SEWAGE.

The necessity of preventing waste, and thus securing the greatest possible economy under present conditions has had the effect of drawing increased attention to the utilisation of sewage. The difficulties of using sewage universally for agricultural purposes by means of broad irrigation are now generally recognised, and recent efforts have been devoted to the extraction of those of its constituents which have any value either for manurial or other purposes.

The importance of increasing our home-grown supply of food, involving the proposed conversion of a considerable acreage of grass land into arable land, has raised the problem of obtaining the necessary amount of manure or fertilisers, and this again has revived the question of utilising sewage sludge for the purpose. The matter was discussed in these columns recently, when it was pointed out that ordinary sewage sludge contains only small quantities of ingredients of real manurial value. In spite of this, there is a large number of places where the local farmers readily take the whole of the sludge produced at the sewage works in their districts, and in some cases they even pay for the privilege of doing so.

There still remain many places, and especially the larger towns, where it is impossible to dispose of the whole of the sludge in this manner. The small percentage of actual manurial value in ordinary sewage sludge renders its cost prohibitive when it has to be transported to any considerable distance. There are two ways in which this difficulty may be overcome. One of them is to add certain chemicals, and thus increase the manurial value to such an extent as to make it worth while to incur the cost of transport, and this has been done to a small extent for some time past, even before the war. The other method is to extract from the sludge those constituents which are valuable and leave the useless material behind. Until quite recently the cost of doing this caused the ultimate product to be too expensive for practical purposes, but the introduction of the activated-sludge process for the treatment of sewage has given rise to hopes that much better results can be obtained than could be anticipated from past experience. The investigations made both here and in the United States show that the sludge produced by the activated-sludge process contains twice as much nitrogen as that produced by the ordinary methods of sewage treatment. Further, its nature is such that it can be more easily dried and prepared for transport.

The whole matter is dealt with thoroughly in two special articles which appeared in our issue of November 24th last, and the only difficulty we foresee is that, owing to the fact that the activated-sludge process is in actual operation in only a few places in this country at present, very little can be done in this direction in time for the cultivation of crops this season. The existing stocks of ordinary sludge could, however, be used up now, and if the matter were taken up with energy at once, a large amount of much more valuable sludge could be prepared ready for next winter by adapting existing works to suit the requirements of the activated-sludge process. It is very desirable that agriculturalists should be made aware of the peculiar suitability of this form of sewage sludge as plant food. We understand that official tests have shown that it produces better crops than an equal amount of farmyard manure of the same strength in nitrogen, and we assume that this must be due to the fact that bacterial action is more advanced in the former than in the latter.

EXTRACTION OF FAT.

Another valuable material in sewage is fat, and its extraction would have the double advantage of producing some income and at the same time preventing the troubles which are frequently caused by its presence in the sludge and in the filters. Up to the present it has only proved profitable to extract fat in places such as Bradford and Oldham, where it is present in the sewage in large quantities owing to the discharge into the sewers of trade effluents from wool-scouring works. In the case of one sewage works constructed since the war began it has been found possible to remove considerable quantities of fat in such a state that it can be sold without further treatment at a good price. As the removal is done by the man in charge of the tanks as part of his regular duties, no extra expense is incurred, and the sums received for the fat are all profit. In this case the sewage reaches the tanks in a fresh state, and, further, the tank treatment is designed to maintain the liquid sewage in a fresh condition, and with this end in view the period of detention in the tanks is not allowed to exceed three to four hours' flow. As a result no scum is formed in the outlet compartment of the tank, where most of the fat collects on the surface and is easily skimmed off by hand. The fact that the sludge from these tanks after thorough digestion is easily dried to a spadeable condition is probably due to some extent to the removal of the fat, which is known to yield extremely slowly to bacterial action.

EXPLOSIVES FROM SEWAGE.

A further possibility of utilising the waste products in sewage was suggested by Dr. S. Rideal in a paper he read at the recent annual meeting of the Association of Managers of Sewage Disposal Works. It was suggested that our overseas supplies of nitrate for the manufacture of explosives might be augmented by extracting the nitrates present in sewage effluents. As it is only the very best effluents that contain nitrates in any quantity, it is evident that the idea is not applicable to all sewage works of the ordinary type. Here, again, however, it was shown that the very high percentage of nitrates in the effluents from the activated-sludge process might bring the proposal within the range of practical politics.

The proposal made by Dr. Rideal was simply that the effluents should be evaporated to dryness, when the nitrates would remain behind ready for use. It was pointed out in the course of the discussion on the paper that the problem was one of cost, and criticism was directed to some suggestions made by the author for evaporating the effluents by natural methods. Such criticism is of little use. What is needed is for engineers with experience of the most economical methods of evaporation to work out a few calculations and state the lowest possible cost of evaporating water in large quantities. There is no doubt as to the presence of nitrates in sewage effluents, or as to the fact that this material, which would be very useful either for explosives or as manure, is now being allowed to run to waste. It is only necessary to ascertain definitely what it would cost to recover it, and it would

[illegible] at once to see whether its recovery would justify the expense.

THE ACTIVATED-SLUDGE PROCESS.

Reference has already been made to the fact that for records of developments in connection with sewage disposal we have to rely on the published reports of work done in the United States. Some of those reports are of little practical value, as they merely describe the works which have been arranged for the purpose of experiment, and give no results, or at the most, a few figures obtained after only a few weeks of operation. It is, however, notable that the bulk of the investigations and research work now being conducted in America relates to the activated-sludge process, and those reports which describe investigations carried out for any considerable period are worthy of careful study. At the same time it must always be borne in mind that in very few cases is the sewage comparable in strength with the sewage in this country, where it varies from 20 to 30 gallons per head per day, while in America it is seldom less than 50 gallons, and often over 100 gallons, per head per day, dry-weather flow.

Although very few reports of the work which is being done in this country are published, it is known that the activated-sludge process is already in operation in about six places, and these are under regular observation. One of the most interesting developments mentioned in a note printed on another page is the introduction of pulsating valves, by means of which the air is delivered [illegible]. It is obvious that this must result in a great saving in the volume of air required. From a report which appeared in our issue of July 28th last, it will be seen that this method of treatment had then been in operation at Worcester, dealing with 800,000 gallons per day, for some months, and that the results were highly satisfactory. In fact, it has already been suggested that the large area of filters and irrigation land previously in use can be "scrapped," and that the ultimate saving to the ratepayers will be not less than £1,000 a year. We also find that in the last annual report of the London County Council upon the London main drainage it was stated that experiments were being undertaken with a view to ascertaining whether this system is applicable to the treatment of London sewage. There is no doubt that when the construction of new, and the enlargement of old, sewage disposal works is taken in hand after the war the activated-sludge process will be adopted in many places, especially as it can be so easily adapted to existing works.

ELECTROLYTIC SEWAGE DISPOSAL.

With the object of providing our readers with all the information available in connection with the different methods of sewage treatment which have been tried from time to time, we have on several occasions published reports upon the so-called "electrolytic" system of treatment. Some of these were distinctly favourable, but we have always doubted whether it would actually prove to be a practical and economical system. The question was, we think, definitely settled by the report of the city officials of New York, printed in these columns on August 18th last. The City Board of Consulting Engineers considered six different methods of dealing with the sewage in one district in the city area, and "dismissed the electro-chemical process because of cost and the uncertainty of results with stronger sewage." Anyone in need of further particulars would do well to refer to the article in question, which gives the conclusions of other reports as well.

STREET LIGHTING.

"Street lighting!" The subject is rather embarrassing, in view of the fact that the streets most certainly have *not* been lighted during the past year; "darkness made visible" would seem to be a more appropriate title for this article, for [illegible] of us who dwell in towns have learnt to realise how very dark the streets can be, with a darkness that may be felt. Unfortunately, the lack of illumination has been the cause of an abnormal number of casualties, due not only to wheeled traffic, but also to falls and other accidents, and it has been seriously questioned whether the gloom has not been responsible for more loss and damage than could have been effected by Zeppelin raids if the lighting had been maintained as usual. During the first ten months of 1916, in the Metropolitan Police District alone, there were 509 fatal accidents and 11,827 non-fatal accidents due to motor vehicles, and the total number of accidents of all kinds numbered some 47,000. Much loss must also have been sustained by the hindrance to traffic, especially during the winter months, when the streets are often dark by 4 p.m. On the other hand, a slight economy has been effected in the consumption of gas and electricity, but not to anything like the extent that might be supposed, for in many cases the street lamps are kept burning, though obscured, and moreover, people prefer to stay indoors, and thus increase the domestic consumption.

[illegible] METHODS OF "DARKENING."

It is to be regretted that the responsible authorities have as a rule neglected to seek the advice of lighting experts in carrying out the regulations, with the consequence that a great deal of quite unnecessary and unjustifiable waste has been incurred. Lamp lamps, for instance, have been boxed in, whereas they might have been replaced by glow lamps of small candle-power, and similarly incandescent gas burners have been kept in use, and a vast amount of experimental work has been carried out in order to find the best way of preventing the rays from escaping from the lanterns. The most successful device appears to be a circular metal plate suspended beneath the burner, which obviates the bright patch otherwise thrown round the base of the lamp-post. The lamp then becomes a mere twinkle, barely sufficient to indicate the position of the post, and thus prevent collision with it. Many of the lamps are totally extinguished, and in these cases the danger of collision is very real. The diversity of methods employed by authorities in adjacent areas has in itself been a source of annoyance, if not danger, to users of the streets, and should have been obviated by the issue of general instructions based upon expert advice at the start. Nothing is more troublesome to both drivers of vehicles and pedestrians than "patchiness" of lighting, which greatly reduces the efficiency of the eye.

GENERAL PROGRESS.

One beneficial outcome of the difficulties abovementioned has been the "Safety First" campaign inaugurated by the London General Omnibus Company, which has already had good results, and bids fair to exert a lasting influence upon traffic conditions and dangers. A Council has now been constituted, with representatives of all the public bodies mainly interested, and will shortly be in a position to do good work. Under the circumstances, no notable advance of a technical nature could be expected, and none has been recorded, but some progress has been made in substituting tungsten lamps for arc lamps and the adoption of "automatic" devices for control [illegible] gas lamps. It has been argued, with reason,

that where the street lamps are capable of being lighted and extinguished from a central point there is no justification for darkening the streets until Zeppelins are reported to be *en route* for the town concerned, but no advantage has apparently been taken of this possibility. It seems that we must await the end of the war for any return to normal conditions—and may it be soon!

TOWN PLANNING.

Despite the abnormal times in which we are living, and the difficulties that beset municipal reformers, much good work has been done by town planners during the past year.

How largely the work of town planning lies in the hands of municipal engineers is shown by a return compiled by Mr. J. W. Cockrill, borough engineer of Yarmouth, which shows that out of 150 town-planning schemes, covering 250,000 acres, 139 schemes were prepared by the officials of the local authorities. In only five cases had outside experts been called in, and in only six cases had competitions been held.

This statement has rather disturbed the complacency of those members of the architectural profession who are never tired of trumpeting their own merits and decrying those of the municipal engineer and surveyor as town planners. They are now driven to the conclusion that it is only in the town-planning competition that any skill can be seen, and that whenever a competition is held the municipal engineer has to take a back seat.

This argument does not appear to be very convincing when examined. It must be remembered that the vast majority of municipal engineers are precluded from taking any part in these competitions both by the nature of their agreements with their councils and by the fact that their time is fully occupied with their own schemes. They have neither the time, inclination, nor need to take part in such competitions. No busy engineer would improve his position with his council by going in for competition work to anything like the extent that is done by half a dozen architects who specialise on this subject. But even in the small number of competitions which have taken place the younger municipal engineers have no reason to be ashamed of the figures they have cut in them. Messrs. Bogle, of the Liverpool city engineer's staff, and Piercey, the deputy borough engineer of Warrington, have been successful in obtaining premiums in the Blackburn, Huddersfield, and York competitions. Their success clearly proves that, given the time and opportunity, they can compete successfully with the best of the architects. When a municipal engineer wins a premium the architectural Press write as if they think the assessor must have been dreaming, or the competitor has scored by a fluke, and they generally manage to damn him with faint praise.

The municipal engineer is too diffident with regard to his abilities and professional status, and he fails to grasp the fact that his undue modesty is a blunder by which other people profit. In this advertising age the professional man, like the business man, who hides his light under a bushel will be certainly overlooked. The architect does not suffer from any false modesty as to his ability and rights, and where he finds opposed to him a class disinclined to assert itself, he promptly rides roughshod over it. Municipal engineers must see that every encouragement is given to their younger members to study this important branch of their professional work by continuing and enlarging the scope of the competitions, which Mr. Cockrill did so much to bring about just before the war.

PAPERS.

Many valuable papers on town planning, which have been published in our pages during the past year, have been read before the Town Planning Institute and the Institution of Municipal and County Engineers, and the lectures by Prof. Adshead have done much to focus attention on this subject. Of these, perhaps the most interesting to our readers were the three papers read at the annual meeting of the Institution of Municipal and County Engineers at Blackpool.

"Civic Study in Civic Design" was the title of a short but interesting paper by Prof. Abercrombie, the head of the town planning department of the University of Liverpool. He insisted that we carried our national habit of embarking on great undertakings without adequate preparation into the domain of town planning, and that this want of study and preparation was costly and wanting in method. There is no doubt that we frequently take up great schemes in a very off-hand manner, and without the necessary data and study to enable us to produce an efficient and economical scheme. A more methodical study is desirable, and Prof. Abercrombie suggests that it is necessary to do this by three stages: (1) The civic survey; (2) a comprehensive town plan; (3) town-planning schemes for definite areas.

In the case of small towns no elaborate civic survey is needed, for the borough surveyor's local knowledge is generally sufficient, but in large boroughs or districts a civic survey is not only useful but necessary. In thickly populated districts such as South Lancashire and Birmingham the towns are so close together that it is, in Prof. Abercrombie's words, "impossible, or rather municipally immoral, for one town to plan for itself without consulting with its neighbours, and such parochial town planning would prove a fatal blunder." This view was strongly supported by Messrs. Brodie and Stilgoe, whose experience in Liverpool and Birmingham on the large town-planning schemes, for which they are responsible, convinces them that it is also necessary to plan for the districts adjoining our large cities.

In his very able paper on "Economic Town Planning," Mr. Ross Young advocated the preparation of a sweeping and comprehensive town plan dealing with an area embracing a number of towns within reasonable distance of each other. Some difference of opinion naturally exists as to what is meant by a "reasonable distance." One speaker, in the discussion of the paper, said Mr. Ross Young wanted to start his town plan at Edinburgh and finish at Greenock, and Mr. Young admitted that he would like to do so. He wanted a plan of the whole industrial area, for if confined to small areas it was site planning, not town planning.

Any satisfactory development of town planning must take into account the need for linking up districts in such areas as those named, and this can only be done by a specially constituted central authority, or in the case of smaller districts by the county councils. The improvement schemes so often projected by large boroughs are frequently rendered useless by the disinclination or inability of the smaller adjoining authorities to carry the improvements into or through their districts.

Mr. Young's paper was mainly an appeal for first taking into consideration the economic expansion of our industries. As was pointed out in the discussion on the paper by Mr. Harpur, we must first know what industries are coming to our towns before we can settle our plans. We want to know where the railways, canals, and docks are to be placed before we can plan the streets for an industrial town. Mr. Young holds that the details of town planning are better left to a later stage,

be pointed out that physical science has done much to divert our industries into entirely new channels. The cheapening of transport, and the introduction of new forms of power, such as oil, gas, and electricity, may divert many of our industries from the coalfields or waterways, where the majority of our industrial towns are now found. This must be carefully considered by the town planner at the present time in connection with the vast sums of money expended on munition works, and the size and importance of the buildings and plant, and the large populations found in many of these munition areas.

While the opinion was expressed by several influential speakers that we ought to proceed slowly with our town-planning schemes, this opinion was not shared by Messrs. Aldridge and Shawcross, who read a paper on "Obligatory Town Planning." These gentlemen wish to see all the districts in the country, rural as well as urban, obliged to make a town plan. They want the Local Government Board to compel every local authority to prepare a town plan, but the provisions should be few and simple. They would provide for fixing building lines, the direction and width of new roads, the number of buildings per acre, areas of sites for dwelling-houses, space about workshops, factories and tall buildings, open spaces, securing amenities, prevention of nuisances, and waiving of unnecessary by-laws.

COMPETITIONS.

Two interesting competitions have been decided during the past year at Dublin and York. The largest scheme was that for the re-planning of Dublin, for which a prize of £500 was offered by Lord Aberdeen some time back. This was won by Prof. Abercrombie and Messrs. S. A. and J. A. Kelly, of Liverpool, who submitted a very fine scheme. There were only eight schemes submitted, and the winning scheme proposed to demolish some of the worst slums in the heart of the city, and provide a number of new roads giving quick communication with the suburbs, so as to lay out an industrial garden city at Clontarf. A new civic centre was to be formed, and the tramways were to be removed from Sackville-street to a new traffic centre further west, while Sackville-street, with its imposing width and fine buildings, was to be converted into a monumental street similar to the Avenue de l'Opera, Paris. A very important feature of the winning scheme was the proposal to reclaim the flats in Dublin Bay and lay out the land for docks and industrial sites. Provision for linking up the railway stations, which are now inconvenient and disconnected, were also made. Dublin has been described as "a city of fine churches and squalid houses," and there can be no doubt that the damage done to the central part during the Sinn Fein rising makes the rebuilding of a large part of the city a matter of immediate necessity.

The York town-planning competition was promoted by the city council, and dealt with three areas in the city. Fifteen sets of plans were submitted, the first premium of £100 being awarded to Mr. R. Dann, the second of £50 to Mr. M. A. Piercey, and the third to Messrs. Burroughs and Stevens.

Outside competitions the chief schemes published during the past year have been the fine set of plans by Mr. R. Atkinson for re-building the central portion of Bath. If carried out they will do much to restore Bath to the position of premier inland health resort. Mr. Thomas Mawson's work for the re-planning of Athens has been interrupted by the war, and the events of the past few months appear to be likely to create a condition of things which will call for a much more extensive scheme of re-building than Mr. Mawson anticipated.

Several schemes for the relief of architectural distress have led to the preparation of civic surveys. Of these the more important are those prepared by the London Society and a group of Manchester architects. The scheme for a London development plan contains imaginative proposals for developing the Metropolitan area, and includes the arterial roads recommended by the London traffic branch of the Board of Trade, with suggested modifications.

The scheme adopted at Manchester deals chiefly with a civic survey of south-east Lancashire. The plans were exhibited in Manchester during October, and proved of great interest to a large number of persons. A meeting of the North-Western District of the Institution of Municipal and County Engineers were invited to inspect them, and while they came in for a good deal of admiration for their novelty and artistic character, they unfortunately showed the lack of practical requirements, which is so often associated with fine artistic qualities. A full description of the plans and an account of the discussion on them were given in our columns on October 27th last.

TRAMWAYS.

While new construction has, of course, remained at a standstill, tramway managers certainly cannot complain that they have not had plenty to occupy themselves with during the past year. The general shortage of staff and labour may fairly be put first as the item which has required the most anxious attention. In June compulsory service was extended to married unattested men of the age of [illegible] and a large number of men had to join the Colours, while others, temporarily exempted, are still being taken. In some cases assistance has been obtained from volunteer drivers and conductors who are not liable to military service, but these form but a trifling total compared with the system, of whom some 10,000 are now serving (including about 1,000 in company employment). The vast majority are conductors, but Glasgow and a few other undertakings have successfully trained about 200 in all as drivers, and so far, apparently, there has been no reason to regret this step, as the number of accidents has not increased on these systems.

We do not suggest that there are no drawbacks to the employment of women for work as conductors or drivers, undoubtedly there are, but on the whole the experiment has proved highly successful. Without their aid the tramway transport facilities would have been in many areas absolutely crippled. In this connection we may mention, with pride, that up to the beginning of August the number of tramway employees who had joined the Colours was no less than 27,814. As long ago as January last the Birmingham tramways had lost 75 per cent of their men, and Manchester was paying some £72,000 a year to the dependents of enlisted employees. In view of the importance of retaining a sufficient number of men to keep the cars running—many of the men being engaged in work that no woman could possibly do—pressure was brought to bear on the Reserve Occupations Committee, and in March a measure of exemption was granted under very strict conditions. By October forty-four tramways were certified.

OTHER EFFECTS DUE TO THE WAR.

Naturally the conditions arising out of the war have affected the tramway services at every turn. The shortage of staff has led to an increased use of trailers, which at first had been stubbornly and unreasonably opposed by the police, but which have fully demonstrated the wisdom of their adoption. Over 130 are in use in London, and

they are no longer restricted to the "rush" hours, but are permitted to run all day. Their number will shortly be increased to 150 on the London County Council tramways, and permission has also been granted to the Metropolitan Electric Tramways Company to use them. The lighting restrictions, applying not only to the street lamps, but also to those carried on the cars, have very seriously hampered the operation of the tramways everywhere; in many cases the average speed has had to be reduced, and, owing to the physical strain on the drivers, the services have been cut off after 10 p.m. or 10.30 p.m. Nevertheless, there has been a grave increase in the number of fatalities in the streets due to the lack of light.

In December an excellent movement was set on foot by Mr. H. E. Blain, operating manager of the London General Omnibus Company, and formerly of West Ham Corporation Tramways, in the form of a "Safety First" campaign, which appears likely to have valuable results. A "London Safety First Campaign Council" has just been formed to carry on educative work, and to instruct both the drivers of vehicles and the public generally in the Metropolitan area with a view to reducing street accidents to a minimum. The company early in the year had started a campaign of this kind of its own, which had reduced the number of accidents due to omnibuses by 25 per cent. The London borough councils, tramway authorities, and the police warmly responded to the proposal, the need for which may be gathered from the fact that in the first nine months of 1916 there were in London no fewer than 34,575 accidents, of which 577 were fatal.

Shortage of coal has at times interfered with electric tramway operation, notably at Birmingham, where also the lack of generating plant has necessitated the stoppage of the cars for some hours each day over long periods. The high cost of coal has also led to the increase of fares in many towns.

As regards working results, which necessarily have been affected by the war, local circumstances have had a controlling influence. In areas where there are many munition factories large profits have been made, while in others less favoured either a small profit or an actual deficit has been recorded. The heavy loss on the London County Council tramways can hardly be ascribed to the war, as it is becoming the normal condition of this huge and costly undertaking. With a capital of nearly £14,000,000 sterling, of which 9·7 millions is outstanding, a total length of 150 street miles, and a revenue of nearly 2·34 millions, there was a deficit of £73,795 to meet from the general reserve fund, which now stands at less than this figure. It should in fairness be mentioned that the tramway strike caused a loss estimated at £100,000.

MISCELLANEOUS ITEMS.

In October the Devonport tramways, which were purchased by the Plymouth Corporation for about £104,000, were linked up with the Plymouth tramways, and a universal penny fare was inaugurated on all sections. Ashton-under-Lyne is seeking powers to purchase the Oldham, Ashton and Hyde tramways, while on the other hand the Notts and Derby Tramways Company is applying for powers to acquire the Ilkeston Corporation tramways.

Corporations running motor 'buses in conjunction with their tramways have generally done well. The Birmingham Council has the largest municipal fleet of 'buses, numbering forty-one, to which six are to be added. On the other hand, four electric battery 'buses owned by the Corporation of York made a loss of £450, though there was no trouble with the batteries or the electrical equipment.

At Brighton difficulties arose between the corporation and a company because the former would not grant the latter licences to run 'buses for hire in the borough, but this was later settled by the company buying up a rival and coming to terms with the council.

An interesting report on the future of the Edinburgh tramways was published in November, strongly recommending the corporation, when the time arrives, to substitute the trolley system for the existing cable system—the last of its kind in this country. An important decision in connection with the Oxford Electric Tramways Company's motor 'buses, which were declared to be in the class of "extraordinary traffic" on country roads, was made, and damages were awarded to the local authorities for resulting injury to roads. The use of mechanically propelled vehicles by municipal authorities for removing refuse, &c., is steadily extending. Many of these are electrically driven, and have been proved to effect a saving compared with horsed vehicles. In August there were in use or on order in this country 778 battery vehicles of all kinds, compared with 150 in 1914.

WATER SUPPLY.

Under existing conditions the task of reviewing the work of the water engineer during the past year is not easy. Wherever it has been possible to do so, work has been stopped first on account of economy and next because of the shortage of labour, materials, and machinery. It is undesirable to refer to work which has been carried out as a direct consequence of war conditions, and the result is that, as far as works of construction in this country are concerned, there is very little to be said.

Without doubt, water engineers generally have had a very trying time, owing to the great cost of fuel, the scarcity of labour, the long delays in obtaining materials, plant, fittings, and so forth. In addition to these troubles there has been considerable danger owing to the increased possibilities of water pollution and to the sudden and unexpected increase of population in various places where camps or other military establishments have sprung up. However, it is evident that the engineer has not been found wanting in dealing with the difficulties presented, and the country generally is to be congratulated upon the manner in which the water supply has been maintained.

On the other hand, the war conditions have undoubtedly tended to force the members of water boards and committees to rely more than was formerly the case upon the advice and judgment of the engineer. When suddenly faced with some great difficulty, without the usual resources for meeting it, the layman is apt to hang upon the advice of the engineer, as a drowning man will clutch at the object which will keep him afloat, and thus in many cases the scientific adviser has come into his own and has saved the situation. The direct result of the war has been to stimulate scientific research, and in the future we may hope to hear of much interesting work which is at present going forward which has for its object the treatment and purification of water.

Seeing that engineers and scientific workers in this country have either been engaged upon war work directly or else indirectly upon the no less important work of maintaining the supplies at home, under extraordinary difficulties, it is clear that they can have had very little time to spare for writing descriptions of works, books or technical papers, and it is not surprising to find that the bulk of the news of interest comes from

America or from countries less affected by the war. It is only natural that we should see evidences of greater intelligence in the various papers and reports which have been published, and in the general attitude of the engineer.

INTELLIGENT ECONOMY.

Mr. H. Percy Boulnois, in his paper on the "Maintenance of the Standard of Municipal Sanitation During the Continuance of War Conditions," read before the Royal Sanitary Institute, did good work in showing that no diminution in the quality or quantity of a water supply should be practised as a measure of economy, but that the engineer should look to the condition of the pumping station and filter beds, to the coal and lubricant consumption, and to leakage and waste. He further drew attention to the valuable service the public can perform in dealing with the detection and prevention of waste. It would surely be well that this point should be emphasised, and that the public should be better educated in the fact that waste of water is a matter of great national importance, which can best be dealt with by the individual.

Much the same idea seems to be in the mind of Sir John Wolfe Barry, who, in a recent contribution to the *Times*, drew attention to the fact that economy in the use of water by the individual consumer often means a saving in the consumption of coal. In the London area, for example, the Metropolitan Water Board estimates its coal bill for the ensuing year at £300,000 for pumping an average daily supply of 36 gallons per head for 6,750,000 persons. To the 190,000 tons of coal thus annually consumed must be added the amount of coal used by the London County Council in pumping this water again in the form of sewage. It would be possible to reduce this quantity of water materially, and thus to reduce the fuel bill, if the average householder were careful to stop all waste. There can be no doubt that there is daily allowed to run to waste in every house an enormous quantity of water which would certainly be saved if the person wasting it had to pump it up by hand from a well. The saving of waste such as this entails no hardship, but merely requires the exercise of a little thought.

No better illustration of intelligent economy exists than that of the sterilisation of the London water supply.

STERILISATION OF THE LONDON WATER.

London has at length adopted the policy of water sterilisation. This does not mark any new discovery, or even the trial of a new method; it merely means that after sterilisation by means of hypochlorite had been adopted on the largest scale at hundreds of places in America, and on a smaller scale in this country, the Metropolitan Water Board have at last recognised the obvious advantages of the method and have adopted it on a limited scale after being forced to do so by the growing impurity of the Thames water and by the urgent need of saving the cost of pumping and labour, at a time when the cost of fuel is prohibitive and labour very scarce. The fact that London has set this example will, when it comes to be known generally in the country, which is not [illegible] encourage other water authorities to make use of the process.

In these pages it has been urged, till readers must be tired of repetition, that, as water of very impure quality can be made perfectly pure by treatment, it is obviously possible to supply many places with good water by making use of the [illegible] at hand, thus saving the outlay on large works, which is impossible in many places, particularly in rural districts. Further, that in [illegible] the sterilisation of the water would not only lead to a saving of money, but would produce safety where a risk is now run.

The words of Dr. Houston's twelfth research report to the Metropolitan Water Board are certainly in agreement with such statements. We read that the practice of the water board has been to circulate water through the storage reservoirs in order to improve its *quality*; that this involves a large expenditure of money, as the water has generally to be pumped into the reservoirs; that the water is now allowed to pass direct on to the filter beds after it has been dosed with hypochlorite; that this treatment—viz., sterilisation—purifies the water to a higher standard than is effected by storage in reservoirs; and that the saving involved may be about 10s. per 1,000,000 gallons. Here we get a better result and a considerable saving of money.

During the summer 75,000,000 gallons of water were treated daily, and not a single complaint was received of taste or odour present in the water. There can be very little doubt, however, that if the general public had known that their drinking water was being treated with chloride of lime complaints would have been many. Such is human nature and the powers of imagination. The immediate effect of this treatment, moreover, has been that the life of the sand filters has been considerably prolonged. It has evidently taken Dr. Houston, who was the originator of the method of hypochlorite sterilisation of town supplies, all these years to persuade his board to adopt the method. We see here an excellent example of the fact that, while England possesses scientific workers, who have the ability to discover and perfect new methods, the bulk of the people do not attach proper importance to their work and advice, and that we allow other nations to reap the reward, and even to claim credit for the invention in many cases. One may reasonably ask how much money the Metropolitan Water Board might have saved if this process had been adopted years ago, and how much money the whole country might have saved if they had had an intelligent grasp of Dr. Houston's method.

FILTER-CLOGGING PREVENTED.

The report above referred to contains an interesting section dealing with the possibility of preventing the clogging of filters by chemical pre-treatment of the water. Such clogging is due very largely to algal growths in the water; if these are got rid of, or if their growth is prevented, the life of the filter is prolonged considerably, with a resultant saving of expense. By careful examination of the water it is, moreover, possible to tell when any sudden increase in the algal growth is taking place. Such an examination has an anticipatory value, inasmuch as the knowledge obtained may precede the actual occurrence of filtration and other troubles, thus allowing remedial measures to be put into operation in advance.

ADVANCES IN WATER TREATMENT.

Closely akin to this subject is the work of Prof. N. L. Huff and Mr. O. G. House at St. Paul, described in a paper read before the convention of the American Waterworks Association in New York. By careful attention to detail, and independent observations free from the usual consideration of precedent as a guide, it was observed that, in treating the water in a reservoir with copper sulphate for the removal of organic growths, it was possible to effect a very great economy in the chemical by applying it only where it was required. It was found that certain quiet, shallow pools were breeding-places for various organisms, and that by applying small quantities of the chemical at such points the main sources of trouble were checked. Very shallow bays, flat, muddy shores, and small ponds were treated by spraying the chemical over the surface with a hand pump. In the ordinary method, where a bag of the chemical is towed behind a boat, it is

to be observed that the worst places would be inaccessible, and would therefore receive no treatment. Further, that if a boat were taken through shallow, muddy places, much of the chemical would be absorbed by the organic matter disturbed from the bottom. In the old method the clearest water was over-dosed, and the worst places remained unaffected. The saving in chemical effected by the abandonment of the crude ordinary method was such that one part of copper sulphate sufficed for the treatment of 10,000,000 parts of water. This, again, is a striking example of the manner in which we may use our brains and obtain equally good results at much less cost if we have the faith and energy to do so.

Mr. C. P. Hoover, chemist of the Columbus waterworks, described a new process of water purification in a paper read before the American Waterworks Association. This process is an improvement on the process of coagulation by means of ammonium sulphate. In the new process syrup of alum is fed directly into the water supply. Lump alum, a combination of bauxite (a clay containing from 58 to 60 per cent alumina), is mixed with sulphuric acid and boiled until a basic solution of aluminium sulphate is obtained. The solution is then mixed with water, and this is then applied to the water under treatment. By this process five distinct steps in alum making are eliminated—viz., filtering, concentrating, crystallising, grinding, and redissolving. This process is very economical, and the annual saving to the city has been estimated at £1,200, the installation costing £2,400.

Water softening by electro-chemical methods has been described by Mr. C. P. Landreth in a paper prepared for the American Society of Refrigerating Engineers, and attention is called to the important fact that electricity will hasten chemical reaction, and thereby improve the results obtained with the ordinary water-softening compounds.

WASTE AND LEAKAGE.

In America the question of leakage from water mains has received considerable attention. From a paper read by Mr. A. H. Smith, it appears that the leakage from mains in the American cities is very high, which may go far to account for the enormous quantities supplied. Mr. Smith appears to think that a loss of from 30 to 40 per cent of the total supply is common, and even goes so far as to consider that a loss of 1 gallon per day per foot of joint is satisfactory.

Mr. C. P. Chase, in a paper read before the Iowa Engineering Society, said: "I would not be willing to guarantee a leakage of less than 10,000 gallons per mile in ordinary soils" on a pipe line.

It is clear that they do not know everything in America, but we have much yet to learn also in this country as to the prevention of waste, and it is probable that the war conditions will lead to a very great saving of public money in the future, simply because the force of circumstances will compel us to be more careful, and to make good the obvious defects in our systems before we spend money upon new works.

SCIENTIFIC CONTROL.

Prof. J. A. Fleming, speaking at the conference on "Engineering and Scientific Research," convened by the Society of Engineers, pointed out that the enormous destruction during the war of the productions of the engineer's shop and office would call for reconstruction, and offer a vast field for engineering work. Until we produced *more men who could do new things, and not merely know about old things*, it was futile for Great Britain to hope to gain pre-eminence over Germany in scientific industries. The advantages which we had in greater originality of mind and better workmanship were neutralised to a large extent by the want of a sufficiently thorough and broad scientific education to enable us to see the practical value of the openings given by scientific discoveries. It was the want of this sufficiently thorough scientific education which accounted for the limited faith of many employers and capitalists in scientific research, and for the inability of the practical worker to take advantage of, or see the meaning of, facts which presented themselves to him in his everyday work. The first condition of success on the business side of engineering must be association and combination, and the second, scientific method in all things. Prof. Fleming's remarks are entirely to the point, and tend to show how great is the need for highly trained men. The future possibilities with regard to engineering, and to water engineering in particular, depend entirely upon scientific control.

We see the growing tendency to nationalise various branches of engineering work; we find that coal mines, railways, and so forth are thus taken over by the Government, and it is clear that the nationalisation of our water supply must follow. This should lead to an enormous saving of money, and if the national system is under proper scientific control, the result will indeed justify the change.

ELECTROLYSIS.

The destruction of water mains due to electrolysis is a growing evil, and the importance of the subject is well recognised. The findings of the various authorities who have dealt with the matter in the past year are generally to the effect that prevention is better than cure. It cannot be said that very much more is to be gathered.

In a technologic paper of the United States Bureau of Standards, methods proposed for the mitigation of electrolysis of underground pipes were discussed by Mr. E. B. Rosa, chief physicist, and Mr. Burton McCollum, electrical engineer. The authors are of opinion that by far the greater part of the damage caused by electrolysis is that arising from the corrosion of underground pipes and cables, and that in general those remedial measures which are applicable to pipe systems should be regarded as secondary means of mitigation of electrolysis trouble, the principal resistance being proper construction and maintenance of the railway return circuit. In special cases, however, mitigative measures may be applied to underground structures. Of these, the two most commonly applied are the installation of insulating joints and the use of pipe drainage. The installation of insulating joints is a measure which may be adopted when the pipes are being laid, but where isolated pipe systems exist without insulating joints, and where no other underground utilities produce complications, pipe drainage may be effected by the use of insulated feeder systems, so adjusted as to take the minimum possible current from the pipes at all points. These methods should, however, only be used as auxiliary means of protection after reasonable precautions have been taken to reduce potential drops in the tracks to as low values as are economically possible.

Prof. Ganz, of the Stevens Institute of Technology, in a lecture upon this subject, drew attention to the comparative failure that has attended the use of paints or dips, and stated that no dip or paint will permanently protect a pipe against electrolysis in wet soil, and that the danger of electrolytic action may be even greater with such pipes than in the case of uncoated pipes. Experience has shown that stray currents may leave only from the bare spots, with consequent liability to concentrated corrosion. Prof. Ganz suggested surrounding the pipe with a layer of asphalt, about 2 in. in thickness; but, in most cases, the cost is obviously prohibitive. With regard to insulating joints, Prof. Ganz pointed out that it is sometimes possible to use comparatively few insulating joints to break up the electrical continuity of the line, and that insulating joints are particularly useful in cases where small service pipes are endangered by current

which flows to them either from the mains or from house piping.

At the annual convention of the American Waterworks Association there was presented by a committee on electrolysis a report giving evidence of increasing damage to pipes in cities from electric railways. As a remedy it was not proposed to deal in any way with the pipes, but to connect the station with the track at certain critical points by cable. Metallic connection between the pipe and track was not advocated. It appears that there is a disposition to criticise the proceedings of the representative committee which has been established in America, and which includes representatives of waterworks, gas, electric light and railways, together with the American Institute of Electrical Engineers and the United States Bureau of Standards, on the ground that the water engineers were practically overwhelmed by various electrical interests. The United States Bureau of Standards reports to the effect that paints, dips, and wrappings are not of much use in themselves, and that insulating joints offer but an imperfect guard.

FARMER COUNCILLORS AND ROAD WORK.

"RANSACKING" AND TACKLING THE BARNSTAPLE SURVEYOR.

At a meeting recently of the Barnstaple Rural District Council, Mr. J. Andrew complained of men being employed cleaning the water tables at such a time as the present, and mentioned that there was a man engaged in such work between Chapelton and Umberleigh. To his mind it was an entire waste of time, and the man would be much better employed on his farm than in doing that unnecessary work. There was scarcely a bit of stuff to dig up. A good part of the road had been to made, and there were no water tables, the road being carried to the foot of the hedge. It was a scandalous waste to keep men cleaning up when it was not required. He did not think there was a butt-load of material in forty landyards. There he was performing this operation at a cost to the poor ratepayers, and then not helping the roads. Could the surveyor let this man go on the farms for a while?"

The chairman (Mr. L. A. Alford): You just remarked that we shall lose our money from the county council if we do not keep the roads in repair.

Mr. Andrew: That does not mean to say we should do unnecessary work.

The surveyor (Mr. A. A. Richards): We cannot do too much cleaning of the roads, especially at this season of the year. They want all the attention you can give them.

Mr. Andrew: I entirely disagree; this is unnecessary work. It is not required. I would like to ask the surveyor to give his attention to the bit of newly made road, as it is getting into a very bad condition.

The chairman: No doubt Mr. Richards will see to it.

Mr. Andrew: Could this man be spared for the roads?

The surveyor: No; we want more.

Mr. J. Hobbs: If Mr. Andrew wants the man, all he has to do is to offer him a shilling or so per week more than he is now receiving.

Mr. John Bailey said he thought the surveyor must have the patience of Job to allow of his being "ransacked" and treated by every councillor as to what he should and should not do. He always looked upon the surveyor as a most efficient official who was to be trusted. They must all trust Mr. Richards. He could bring no complaints as well as other members, "but we shall drive the man off his head if we keep on."

The chairman: Mr. Richards appreciates any hints you can give him.

Mr. Bailey: I do not think he likes too much fault-finding.

Mr. Andrew: What are we here for if it is not to look after the roads?

Prosperous Tramways.—The reduction in the number and speed of motor omnibus with the advance in petrol has had the effect in Manchester of swelling the receipts of the tramways department.

MUNICIPAL WORK IN BULAWAYO.

ROADS, SEWERAGE AND SANITARY SERVICE.

"On account of the continuation of the war, the year has been one of depression, and consequently no new works of any magnitude have been taken in hand. Information, however, has been obtained, as opportunity offered during the year, for various future undertakings, such as water supply, sewerage, &c., which will be found useful when required."

Mr. Arthur H. Waller, ASSOC.M.INST.C.E., the town engineer of Bulawayo, South Africa, makes these remarks at the outset of his report for the twelve months ended June last. Among the works to which special attention has been given is that of road upkeep, and in this connection Mr. Waller says: "The streets recently hardened with graded granite are standing remarkably well considering the fact that the binding material available is of a very gritty nature, and that we have not the water to give sufficient street watering. New roads require daily watering for some time after construction, and it is pleasing to note that, notwithstanding the difficulties mentioned, only a very few small patches have worked loose. The approaches to the New Bridge, although well rolled before the macadam was added, have subsided slightly, but not to such an extent as was anticipated. The work could not be allowed to wait for soaking rains, which would have consolidated the filling. After next rains I anticipate that all settlement will have taken place, when any irregularity of the present road surface can easily be rectified. An excess amount of binding material has been recently spread on part of the surface in order to counteract the shortage of watering."

PROPOSED SEWERAGE SCHEME.

In January last Mr. Waller placed before the Public Works Committee a report on the question of slop-water removal by means of stoneware pipe sewers. Some few years ago this subject was brought before the council, when it was proposed to use 4-in. diameter steel pipes, collecting the slop-water only, from the various hotels, running it by gravitation to a point in the North Park, and pumping to the compound tank, where it was again to be pumped to the municipal farm. In his report the town surveyor pointed out the unsatisfactory nature of this scheme, and advised that stoneware pipe lines, with junctions for future connections, should be laid in such positions and of such sizes as to work in with, and eventually form part of, a complete system of sewerage. This system, in addition to providing means of disposing slop water and fæces from hotels and other institutions, would, he observes, considerably enhance the comfort and health of the community, and effect a considerable saving—after providing interest and sinking fund—on the present system.

The estimated cost of the scheme is, in round figures, £10,000.

SANITARY SERVICE CHARGES.

In the report of the chief sanitary inspector to the municipality, Mr. C. E. Hall, there are some interesting particulars regarding the sanitary service charges.

The cost of rubbish removals is provided for at a minimum charge of 5s. per month from all premises, so that there is a regular removal of all domestic and trade refuse. Where large quantities of refuse are removed a charge of 10s. per cubic yard is made.

The cost of slop-water removal is provided for at a minimum charge of 7s. 6d. per month, or 10s. per load of 300 gallons, except where special contracts are made, and on these charges an abatement of 25 per cent is given, provided prompt payment is made.

The cost of stercus removal is provided for at the rate of 10s. per pail per month, and extra pails at the rate of 8s. per month each (less 25 per cent abatement). For native latrines the cost is 2s. 6d. per pail per month (nett). For these charges there is a regular nightly service, clean pails being placed in the closets each night.

The cost of removal of dead animals is at the rate of 15s. for a horse, cow or donkey.

Edinburgh Tramways to be Purchased.—The Edinburgh Town Council have decided to accept the proposal of the Tramways Committee for the purchase of the Edinburgh and District Tramway Company's undertaking. Fifty thousand pounds is to be paid for 260 cars, and the company undertake to leave the rails in such a condition that at the termination of the lease these would be fit to carry on cable working for at least six years after the termination of the lease.

Ferro-Concrete Bridges on the Meuse.

[An illustrated article dealing with the Bouvignes, Rouillon, and Hermalle Bridges will be found in our issue of November 24th last.]

The town of Namur, formerly the capital of a countship acquired by Burgundy in the fifteenth century, and now the chief town of the province of Namur, occupies an exceedingly picturesque situation at the confluence of the rivers Meuse and Sambre. The town is on the northern bank of the latter river, on the southern side of which are the Citadelle, the Grand Parc de la Citadelle, and the Faubourg de Salzinnes.

Standing on a hill rising to a height of 705 ft., the Citadelle is on the site of an old Roman fort and of the castle of the Counts of Namur, two towers of the latter being still extant. The remainder of the plateau is occupied by the park, which constitutes a pleasant resort for those in search of recreation and sports, and the suburb of Salzinne lies to the north of the park.

Before the war, access to the plateau was readily obtained from the town by several bridges across the Sambre, and from the Faubourg de Jambes, on the eastern side of the Meuse, by a masonry bridge of nine arches.

Like every other form of construction, the celebrated forts of Namur, once believed to be impregnable, have succumbed to the destructive effects of modern high explosives, a fate afterwards shared by many formidable underground fortresses constructed by the Germans on the Somme and the Aisne, and regarded by them as absolutely impregnable.

FIG. 1.—RUINS OF MASONRY BRIDGE AT NAMUR.

Very little information is available as to the present state of the bridges across the two rivers. Probably they were destroyed during or after the bombardment of Namur, and have been partly restored for the convenience of the enemy. The only definite knowledge in our possession is that conveyed by the photograph reproduced as Fig. 1. This view was taken from the quay in the suburb of Jambes, and shows only a part of the bridge on that side of the river. The heaps of masonry in the waterway represent the remains of the arches destroyed, and above the *débris* are electric cables, pipes and tramway rails. On the extreme left is the Donjon of the Citadelle above the boulevard facing the river, the town being in the distance on the extreme right.

Of the two Hennebique bridges in Namur, one carries part of a track on the Plaine de Jeux, to the south-west of the Citadelle. As shown in Fig. 2, the ground is here of a somewhat rugged nature, and is of unstable character. The bridge has an arch-span of 132 ft., and was built entirely in ferro-concrete, the parapets being of masonry. Although quite unpretentious in appearance, this structure is one of fairly important dimensions, and was completed in the year 1911 for the Belgian Government under the superintendence of M. Dethy, Ingénieur-en-chef des Ponts et Chaussées.

FIG. 2.—BRIDGE ON THE CITADELLE HEIGHTS, NAMUR.

FIG. 3.—BRIDGE OVER THE SAMBRE AT NAMUR.

The other bridge at Namur crosses the river Sambre in a single arch of 170-ft. span and 10 ft. wide, being intended for the convenience of pedestrians between the town and the pleasant resorts on the opposite side of the river. This bridge, constructed for the Belgian Ministry of Public Works, is of striking design, as illustrated by Fig. 3, the slenderness of the arch being a noteworthy feature now tolerably familiar to engineers, but formerly regarded as a rather daring illustration of the elastic strength possessed by Hennebique ferro-concrete. The structure was in continuous use for a long period of years before the outbreak of the present war.

BRIDGES AT LIÉGE

An announcement was made nearly two years ago to the effect that all the bridges at Liége likely to be of future use to the Allies had been destroyed by the Germans. It is therefore probable that at least three of the examples of Hennebique bridge construction in the Walloon capital are no longer in existence.

Fig. 4.—Pont de la Boverie, Liége.

Of the four bridges described below, two cross the main stream of the river Meuse, one spans a new channel, known as the Derivation, of the river Ourthe, which flows into the Meuse at Liége, and the fourth is a railway bridge on the outskirts of the city.

The principal part of the city lies on the left bank of the river Meuse, between which and the Derivation there is a long island, sometimes termed l'Ile de la Boverie, occupied by another important part of the city, and affording excellent sites for the Institut d'Agronomie and the Parc de la Boverie. Beyond the Derivation are quarters consisting largely of industrial works and dwellings of the working classes, the region being traversed by the main and subsidiary channels of the river Ourthe all connected with the Derivation.

PONT DE LA BOVERIE.

This bridge occupies a central situation near the University, and provides convenient means of cross-river communication between the chief portion of the city and the Longdoz railway station, whence trains run to Namur, Aix-la-Chapelle and Maastricht.

As may be noticed on reference to Fig. 4, this is a masonry structure of five arches, the piers projecting above the roadway being standards for the supply of current for electric trams are passing over the bridge. Owing to the limited accommodation for vehicular and pedestrian traffic provided by the original design, it was decided by the city authorities about fourteen years ago to widen the bridge, and the project submitted by the Hennebique organisation was finally adopted and carried into effect during the year 1903. The essential advantages of the scheme were that it provided for a substantial increase in effective width in a particularly economical manner, without impairing in any way or altering the characteristic appearance of the structure.

By the simple expedient of applying ferro-concrete encorbelment for the addition of new footwalks on each side, the whole of the original width of the bridge was made available for the roadway, the result being akin to that secured by the widening of London Bridge, although the operations were executed in a far more economical manner.

PONT DES ARCHES.

The highly satisfactory widening of the Pont de la Boverie was followed a few years later by a similar adaptation of ferro-concrete corbelling to the Pont des Arches, one of the most beautiful masonry bridges across the river Meuse. Built some sixty years ago, this work carries the main highway from Brussels to Aix-la-Chapelle, across the river, and connects the two most populous quarters of Liége. For many years previous to the execution of the widening work, the bridge had been found absolutely insuffi-

Fig. 5.—Pont des Arches, Liége.

cient for the conduct of vehicular traffic, especially after the installation of three lines of tramway tracks. The total width between parapets was about 40 ft., and after providing for two footwalks, each 6 ft. 6 in. wide, only 26 ft. 3 in. was left for the roadway.

Owing to the continued growth of traffic, the work of widening at last became a pressing necessity, and as it would have been highly inconvenient to close the bridge for the execution of the work, M. Cornet, Ingénieur-en-chef, Directeur des Ponts et Chaussées, adopted a project submitted by M. Hennebique, and providing for the construction of corbelling which could very easily and rapidly be put in place.

The corbelling was formed of ferro-concrete slabs 5 ft. 3 in. wide by 16 ft. 5 in. long, about two-thirds of the length of each slab resting on the old masonry, and the remaining third projecting in cantilever for the support of new footwalks. The slabs are connected longitudinally by ferro-concrete beams and counterweighted by mass concrete, while as an additional safeguard the corbelling is anchored down to the original masonry. In all 144 slabs were required.

Fig. 6.—Pont Mativa, Liége.

and these were moulded in advance in a contractors' yard close to the site.

In order to obviate the stoppage of traffic, work was carried out in two longitudinal sections, the downstream half of the bridge being first taken in hand, and completed in six weeks. The other half was finished five weeks later. As remodelled the bridge has a roadway 13 ft. 2 in. wider than before, an important increase which was secured at a very moderate cost, and, as may be judged on examination of Fig. 5, without impairing the appearance of the structure in the slightest degree.

The joining up of the widened roadway and the new footwalks of the bridge with those of the adjoining thoroughfares was effected by constructing approaches curving outwards from the bridge, thus smoothing away sharp corners on each side of the river. These approaches were formed in ferro-concrete moulded on centering supported from the towpaths passing beneath the end arches of the bridge.

The ferro-concrete corbelling is faced at the outer edge by stone moulding, above which rises a stone parapet, the ferro-concrete being visible only from the river and towpaths.

PONT MATIVA.

This remarkable bridge was constructed early in 1905 over the river Ourthe, and opened in time to afford means of communication between two portions of the Exposition Universelle de Liége.

The bridge has a total length of 262·40 ft., and includes a central span of 180·40 ft. It is 32·80 ft. wide, and the thickness of the main arch is only 1·15 ft. at the crown. The slender proportions of the central arch and its exceptionally small rise, less than one-fifteenth of the span, were due to the requirements of the specification prepared by M. Jacquemin, the engineer acting for the Committee of the Exposition.

Fig. 6 is a view of the bridge, which was constructed entirely in Hennebique ferro-concrete, and passed a number of exceptionally severe tests in March and April, 1905. One of the tests was conducted by marching bodies of infantry and cavalry along the roadway under the superintendence of Colonel Algrain, representing the Belgian War Ministry.

It is possible that a good many practical tests of the same character have since been carried out by the Germans, if the bridge was not destroyed after their occupation of Liége.

SPECIFICATIONS FOR CONCRETE.*

By CLOYD M. CHAPMAN.

To be generally acceptable, specifications for concrete should fulfil two requirements—namely: (1) They should insure the production of suitable concrete if the aggregates are properly used, and (2) they should permit the use of materials found in the vicinity of the work, if such materials are capable of producing concrete of the required quality.

The present method of specifying may insure the quality of the material, but it does not permit the use of a wide choice of aggregates from which first-class concrete may be made.

Concrete is a cheap building material because it is composed largely of inexpensive aggregates, and for economic reasons these aggregates should be secured from deposits in the vicinity of the point of use. Whatever materials are locally valuable for aggregates must be used in the great majority of cases, for aggregates which must be transported long distances are no longer inexpensive. The material at hand capable of making concrete of fair quality will generally be used in preference to a better material which must be brought from a distance at considerable cost for transportation.

It is generally true that even a very poor sand—that is, one which compares very unfavourably with standard sand when tested in 1:3 mixtures with cement, will give a suitable compressive strength if sufficient cement is used. Where most excellent materials are available the present style of specification does not permit a variation of the proportions, however good the materials may be. For instance, some well-graded sands give strengths 40 per cent higher than that obtained with standard sand in the proportion of 1:3. Yet such sands receive no credit for quality under the present form of specification.

* From a paper read before the American Society for Testing Materials.

Specifications serve their purpose when they secure the products described, but they serve the industry best when broad enough to cover all the materials capable of furnishing a product of the desired quality.

In order to cover and include all materials which are capable of producing concrete of the quality required for the particular service it is to perform, it is only necessary to specify the result required instead of specifying the materials used. In this way it would be possible not only properly to safeguard the product, but to permit the use of such materials as are available in each locality.

LOCAL MATERIALS.

It is also true that in many cases the local materials are of such poor quality and would require such a large proportion of cement to fulfil the specifications, that it would be economical to bring in better material even from a considerable distance, the saving in cement paying the freight. Specifications of this kind might take some such form as the following, in which all figures are purely arbitrary and in no sense proposed as a standard:—

The materials used shall be of such quality and shall be used in such proportions as to produce a concrete which shall show a compressive strength of 2,500 lb. (or 2,000 lb., or 1,500 lb.) per square inch at the age of twenty-eight days when tested in accordance with the standard methods of testing.

This form of specification is obviously open to modification to cover varying conditions. For instance, to insure against concrete which sets or hardens slowly, and consequently requires forms being kept in place an unusual length of time, the specification may require a certain minimum strength to be attained in three days. Again, in sea wall or tunnel work, requirements as to permeability or density may be inserted either in place of, or in addition to, the strength requirement.

It would probably be desirable to add some further qualifying clauses, such as the limit of size of particles, the character of the materials composing the aggregates, freedom from constituents liable to cause deterioration, and the like.

The method at present most commonly employed is practically to ignore the quality of materials except the cement, and arbitrarily to specify proportions that will give good results with almost any aggregates. Wherein lies the incentive to a contractor or builder to use any better materials than the cheapest if he is compelled by the specifications to use a certain arbitrary mixture, regardless of quality or material?

Any specifications for concrete aggregates which are to be used all over the country must be so drawn that any material which will make concrete of the required quality will be included.

TESTING.

In operating under such specifications it is of great importance that specimens of the concrete produced be regularly made and tested. It is also of the greatest importance that a close day-to-day check be maintained on the quality of the materials used, so as to insure a reasonable uniformity, and to know that these materials are at least equal in quality to the materials used in arriving at the proportions required to give the quality of concrete called for in the specifications.

Having once established by test the suitability of sand and stone for any grade of concrete, and having determined the proper proportions in which to use them to attain a certain desired result, it is only necessary thereafter to see that the size, grading and proportions of these materials are reasonably constant to insure uniform quality of concrete. Such a check on size and grading should be had on each and every shipment of material, and is easily obtained with a small set of sieves, or, in the case of sand, which is by far the more important material, by means of a self-contained sand tester.

The regular and systematic testing of the size of the aggregates gives data which will permit the engineer to tell without further tests whether the aggregates will produce a better or poorer concrete than that produced by the original or standard sample. This fact is based on the well-established principle that, other things being equal, the aggregate whose granulometric-analysis curve most nearly approaches the line of maximum density will produce the best concrete. This makes it possible to determine with reasonable certainty which two sands of the same kind and from the same source, but differing only in fineness, will make the better concrete.

Decimal Weights, Measures and Coinage.

By EDWARD C. BARTON, F.R.G.S., Brisbane, Queensland.

The time has come for a decision to be made as to the future of measurement and its language throughout the world. Commerce has so interlaced the nations that, even in war, they are all affected. Through the exchange of scientific records they are keenly interested, at all times, in the use of each other's results, and the scientist has long ago decided in favour of an international set of units. He has adopted the metric system as the only one which agreed with his requirements, and it is used in every scientific process of manufacture in the world, whether in Lancashire or on the sugar plantations of Queensland. Commercial and industrial men are considering its suitability to their wants in this country. Australia and New Zealand have long ago decided in its favour and only await the signal.

Ever since the Florentine philosophers wasted their time in making experiments in heat with unstandardised thermometers it has been apparent to all that the value of a record depends upon the terms in which it is made. The units of measurement in regard to land are particularly important in the making of those priceless records that form the foundation of all structures, whether of masonry or agriculture, which are inseparable from advanced civilisation. Those units should be few and correlated among themselves by one simple proportion. They should also be correlated with other measures in such a manner that any lost units may be easily replaced with exactitude.

The metric system of measures and weights fills all these requirements, and no other system has ever done so since the fall of Babylon. In the matter of proportion, it may be claimed that systems such as our "Imperial," with its variants of duodecimal and binary proportions, is superior to the metric, but the fact of 10 being the common basis of the metric system and of our counting system is such an overwhelming advantage that its non-divisibility by 4 or 3 becomes relatively unimportant. The further fact of the metric system using only one basis of proportion makes it superior to any system with many bases such as ours with its 15 different proportions, including 5½ and 30¼.

The surveyor is entrusted with making the most important records of the nation, and his work should be durable and accessible to all. This means that it should be written in a durable set of units. If his present units are doomed to disuse, his work will be robbed of much of its value. Therefore it is important that he should make his mind up on the subject of the oncoming battle between the imperial and the metric systems.

When he remembers that the whole of the scientific world is metric, and that half the commercial world is also working on the same system, and when he further thinks of the fact of whole industries, such as the motor trade, the chemical trade, and an increasing number of other engineering trades which are partly or exclusively doing so, he must realise which system is dying. It is needless to point to Russia with its 180 millions and its freedom from the metric taint. Russia has its own measures, and no country has ever abandoned its own except to adopt the metric system. The great Republic of the United States also has been looked upon as a bulwark of our system, but that country is held by the ideas of its two best customers—Canada and Great Britain. It would be unwise on their part to do otherwise, and yet there is a great agitation over there for the metric change. Even in our own country we find that practically every Chamber of Commerce which has looked into the matter has resolved in favour of the same change. Recent examples are the Coventry, Gloucester, Southampton, Woolwich Chambers, while the Engineers' Association of Manchester passed the resolution by a tenfold majority.

Whether such progress of the metric system is likely to meet with a reverse is dependent on its inherent advantages, and so it will be well to enquire further into the details of the controversy.

EDUCATION.

Here we find that the business aspect of the question usually hides the more important one of education, the mention of which leads the admirers of our system to praise it for its value in arithmetical gymnastics, and to describe the metrists as poor users of the multiplication tables. The question is wider than this. On September 3, 1916, the *Times* reported the compromise made between the classical and the science masters of England, whereby the classical men agreed to an unlimited amount of science, provided that it left them with just the present quantity of classics. This means that room must be made for science at the expense of some other subject, and not by cutting down the classics. Science has been notoriously neglected among us, and our mathematics have suffered from the want of that life-giving force which arises from its application to the higher uses and produces the real scientific spirit so necessary in the world of finance and statesmanship. With the usual limitations to school years, there is not time for such a development and for the classics in their present strength. When the whole work is handicapped by the use of disconnected weights and measures gathered from all the neighbouring nations, during our march into civilisation, the task becomes wellnigh hopeless. If the metric system were adopted, the work of teaching science would not only be aided directly, but we should be able to shorten up the hours devoted to common arithmetic, and "practice" to the extent of so many hundred hours as would be equivalent to another year or two years at school. If the coinage were decimalised the gain would be still greater.

CLEARNESS OF THOUGHT.

Surveyors have, through their adoption of the chain of 100 links and through the decimal division of the acre, shown their appreciation of the ease of thinking in a system which agrees with our system of numbers, and which brings out the beauty of that wonderful invention the "Arabic Method of Notation." Few can realise at the present time the difficulties which beset the originators of our "Imperial" measures, and forced them to adopt such small proportions as 4 gills to one pint, 2 pints to the quart, 2 gallons to the peck; but a fair idea may be obtained from an attempt to make out an account in the Roman numerals which they had to use. Addition was very difficult, subtraction was more so, and to multiply involved the use of pebbles or dried peas. Few could write, paper was unknown, ink was unobtainable, and most records were made with a knife on a stick. A receipt for taxes paid to the King's treasurer was given in this manner, and the stick was then split. One-half was retained by the treasurer and called a "tally" (from the French word "tailler"). Paper was not made by machinery until 1803, and so this old method of giving receipts was not abolished until the time of Napoleon, and the last great burning of the "tallies" took place at Westminster in 1837. It resulted in the destruction of the Houses of Parliament by fire.

THE ADVENT OF ARITHMETIC.

The use of arithmetic as we know it was only possible with paper at a price within the reach of all, and the real usefulness of the "Arabic notation" was not really felt by the many until the end of the eighteenth century. Men like James Watt, of steam engine fame, appreciated the changed situation, and it was he who wrote to a French savant suggesting a decimal system of weights and measures, thereby leading to the creation of the metric system as finally evolved by the French Government of that day. Unfortunately, the system was left to the Revolutionary Government to promulgate, and that led the other nations to look upon it with disfavour. Even Napoleon had to disown it when he was trying to establish himself among the royalties of Europe as a respectable member of the community. The system has outlived that "odour of the guillotine," and we see it to-day supreme in the scientific work of all the nations of the earth. Neither prejudice nor national vanity need therefore trouble us, and we might advantageously remember that the great French nation have voluntarily abandoned the meridian of Paris in favour of our Greenwich meridian, although theirs was the older.

ELECTRICAL UNITS.

In electrical work it is not only supreme, but it has influenced the whole nomenclature. The electrician

saw that he would be wasting the powers of "Arabic" arithmetic if he adopted small proportions, such as 2, 4, or 8, and eschewed them in spite of their binary qualities. He also saw that even steps of 10, as in the metric system, were an absurd pandering to the prejudices of folk that could only think in quantities of 4 gills and 2 pints. He had seen the survival of the tonne of 1,000 kilogrammes, each of 1,000 grammes, each again of 1,000 milligrammes, with a long list of defunct hectograms, decagrams, decigrams, centigrams, and he boldly went for steps of 1,000, but he adhered to the nomenclature of the metric, so that he now has the kilovolt of 1,000 volts, and the volt has 1,000 millivolts. He has his kiloampère for measuring heavy currents, and his milliampère for the small. With him, as with the metrist, kilo always means a thousandfold, and milli means a thousandth part.

The full advantages of such interrelationship between all units present and future cannot be secured by any other than a décimal system throughout the world of science and industry, and the metric fills the requirements well. The advantages are not confined to clearness of thought in ordinary commercial matters, such as the reckoning from the weight (say, 83 kilograms for 8-gauge iron wire) per kilometer to get the weight of one meter (*i.e.*, 83 grams), or reckoning prices such as that of a litre of ale from the price of the hectolitre (a hectolitre at 30 francs is the same as a litre at 30 cents).

It also eases the processes of calculating in percentages, such as densities of liquors, expansions by heat in measuring apparatus. A fall of 1 millimeter of rain on a hectare gives 100 litres of water weighing 100 kilogram. The same fall on a square kilometer would give 10 tonnes of water. Then the important matter of tabulation and of expressing them in curves is much assisted by the fact that one system of division—*i.e.*, for ruling the paper—will cover efficiencies (in percentage) and densities (in percentage) as well as the absolute quantities and lengths, areas, volumes, prices, discounts, &c.

DIFFICULTIES OF THE CHANGE OVER.

The troubles connected with the change of system have been, in countries which have adopted the metric system, or have introduced decimal coinage, insignificant, compared with those which were anticipated. Men eminently qualified to judge of the mental peculiarities of the Eastern mind, such as Sir Hercules Robinson, predicted riot and revolution as the effects to be expected from such action, and yet we find that the decimal coinage was brought into use in Ceylon without the slightest trouble. In six weeks the "great event" was forgotten. In the matter of weights and measures the operation is more serious, and therefore time is given for a more gradual change, usually five years. The great concerns of the country, especially the great Government departments, take the lead, because they see the danger of letting long contracts on the old measures. Manufacturers, such as the tool makers, who have to make and stock two sets of drills, &c., press their customers to make the inevitable move. The farmers, who have in this country been clamouring for decimalisation of all weights and measures (*vide* the resolutions of the Congress of Chambers of Agriculture in London, 1911), may be expected to assist in bringing the new measures into general use throughout the country.

OPPOSITION TO BE EXPECTED.

As in all matters, there will be a considerable number opposed to the introduction of new methods. There will be the class of men like Lord Brougham, who see "paving stones flying around the heads of the people who permit gas to be carried under their streets," as there were those who feared that the British Empire would fall with the abolition of the pigtail in our Army. Those people are not to be seriously considered, but there is a class of people who oppose the change from more cogent reasoning—*i.e.*, the engineers and the textile manufacturers. For the ordinary man and woman it will be a nine-days' wonder, like the "Daylight Bill," but the owner of machinery that turns out a product on the inch or yard measures knows that he must meet the new condition of things with his existing plant. The retail dealer can retain his scales and need only replace his weights, but the engineer who has all his capital in plant must run it many years before he can replace it with machines made to the new measures. He has been told by alarmists that all this plant will be seized and thrown into the scrap heap, and one engineer, Mr. Brough, became so excited about it in 1907 that he tried to scare the rest of the community by telling them that they would have every gas pipe torn out of their houses unless it was made to millimeter sizes. He forgot that the bricks were all to inch sizes, or he would have had his imaginary England reduced to a heap of ruins by the mad metrists.

Few engineers or other manufacturers believe such tales to-day, but they still feel apprehensive as to their being able to sell the product of such machinery, and are only gradually becoming convinced that the change, when it is enacted, will only affect dealings where the money payable is the product of some weight or measure multiplied by a price. They will still be able to make and sell their product, even though it be bolts of $\frac{7}{8}$ in. diameter or cloth of 42 in. width, but the bolts must be sold by the kilogram or the tonne, while the cloth must be sold by the meter, and not by the yard of length. Thus the user of machinery built on the "inch" basis stands in no danger whatever. Curiously enough, those who seek to scare him with this supposed danger know that goods are manufactured on the old measures in all metric countries, and actually make it their chief argument as to the failure of the metric system. The great watch industry in Switzerland held out for twenty years and then *voluntarily* became metric.

As against the elements which retard the introduction of the metric system there is the necessity for meeting the "after war" trade conditions, and securing our full share of oversea trade. Here every turn brings fresh evidence of the advisability of not only making the change to metric measures, but also of decimalising our coinage as well. Russia is probably the greatest fresh market that the world offers, and it does not use our system, but has one of its own, as remarked before. It is not a metric country, but all those departments of its government which have abandoned the local system have adopted the metric—the surveys of the hydrographical department, and some others, the military, both in field and in ordnance work—while all manufacturing is done on the metric system. All the rest of Europe is metric and has a decimal coinage. In coinage we have only Siam and Persia left to keep us company. The Australian states and New Zealand many years ago pleaded for drastic decimalisation through their Premiers at Imperial Conferences, and they now have the law on their Statute books, only awaiting a move from this country.

There is another source of pressure favourable to the decimalisation throughout, and that is the increasing cost of clerical assistance for our offices. This can only be met by the introduction of machinery for counting and book-keeping. Unfortunately, our coinage system calls for machines, such as cash registers, arithmometers, &c., of a costly and complicated type, and we need another and more costly machine for our weights, and another for each of our measures, and, although one company has faced the expense of catering for our "money" machine, none have been so bold as to tackle the others.

CONCLUSION.

In the above it has been shown that our Imperial measures belong to a bygone age, to which they were suited, while the metric system is well suited to our present state of civilisation, and has already advanced to the position of being the only possible universal system, being exclusively used by half the civilised world and by the scientific portion of the other nations. From the educational point of view it alone can bring relief to our over-loaded school children, and allow of science entering into the training of the nation. Not only will the children have less burdens, but they will carry with them through life a set of weights and measures which they can remember and use without short cuts, mnemonics or pocket tables. It has been shown how the metric nomenclature adapts itself to the new sciences, such as electricity, and how it leads to clear thinking in the workshop and the office, while it permits, as soon as the coinage is decimalised, the use of reasonably priced machinery to increase the output of the clerical staff in the counting-house, and enhances the value of diagrammatic methods of visualising industrial and financial processes by curves. It has been shown that the textile and engineering industries have nothing to fear, while they and the merchant have everything to gain in both oversea trade and in economy in the office from a change that will bring us into line with other nations and with our own scientific men.

THE ASHFORD TUBE WELL STRAINER.

The above-named strainer is the result of a long series of experiments conducted by the patentee, Mr John Ashford, superintendent of the central workshops, Public Works Department, Amritsar, Punjab, India, with a view to finding a satisfactory and economical arrangement for drawing large quantities of water from sandy soil without drawing away sand and thereby causing cavitation and sub-sidence of the soil.

The need for such a device had been greatly felt in India not only for submerging areas water-logged by seepage from irrigation canals, but also for irrigating land not served by canals, and for town and village water supplies.

It is estimated that over 50 per cent of the water entering irrigation canals is lost by seepage, with the result that land in low-lying districts becomes swampy and unfit for cultivation. The reclamation of such water-logged land had been attempted by pumping from open tanks and from long, deep trenches, but the results proved disappointing.

Pumping from ordinary masonry wells and from tube wells made by wrapping woven wire mesh round perforated tubes had also been tried. With the former, the volume of water yielded by each well was so small that to obtain even a moderate quantity a large capital outlay was necessary, while with the latter the amount of water fell off rapidly, due to the choking of the wire mesh round the tube.

The following are the conditions that a satisfactory tube well strainer must meet:—

1. It must be strong enough to resist the pressure of the earth surrounding it at a considerable depth.

2. It must exclude all but the very finest sand, and be so made that grains of sand cannot choke it and prevent the admission of water.

3. It must be strong enough to be proof against attempts by percussive treatment, before and during the process of sinking.

4. It must be durable.

5. It must maintain its efficiency under any pumping conditions.

6. The joints between successive lengths of strainer pipe must be strong, easily made and sand proof, while allowing a slight flexibility in the strainer to permit of deviation from the straight in sinking.

(7) The price must be within the purchasing power of the agricultural classes.

The claim is made that three years' experience in the use of Ashford's patent tube well strainer has proved that it meets the above conditions in a satisfactory manner.

The strainer consists of a framework upon which wire is wound at high tension through steel rolls which give it a wedge-like shape, so that when in use the wire presents a flat surface to the surrounding strata with a slit between each strand of about 100th part of an inch wide.

The jointing of the lengths of strainer together is effected by screwing the ends of the bars upon which the wire is wound, and by bringing the notched ends of the bars to be joined together, so that the ends of the bars overlap, when a steel ring in halves, with a projection to fill the notches in the bars, is applied, and the two halves of the ring securely bound together with wire. The bottom of the strainer is finished off with a conical end, and the top is connected to the rising main by a suitable fitting.

The Ashford tube well will not silt up when pumped clear, and it extracts sand when pumped rapidly. There appears thus to be the interesting result that the well-screen material, giving so small an opening, need be strong enough to be used for a tube well.

Pumping has been in progress from an Ashford tube well fitted with 2-in. strainer at Amritsar, India, without any trouble from sand or silting. The tube well in question after sinking was coupled to a centrifugal pump and 23 cubic ft. of water per minute was at once pumped out of it without any trouble.

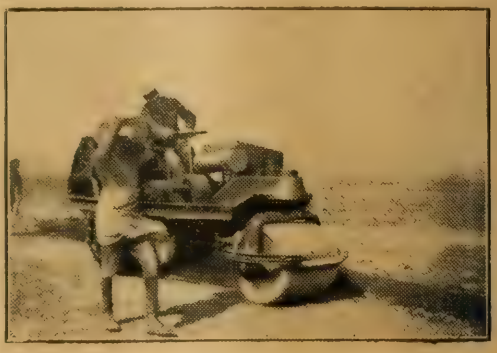
A tube well of similar kind, in the Punjab Irrigation Department's nursery at Amritsar, was so arranged that all the water was first discharged into a tank 2 ft. by 1 ft. by 2 ft. 6 in. deep. It was found when this well was first started that 12 cubic ft. of mineral matter was deposited in the tank during the first run of 5 hours with a discharge of 23 cubic ft. of water per minute. After that the amount of mineral matter kept steadily diminishing from 12 cubic ft. in 5 hours to 3 cubic ft. in 5 hours.

A 5-in. well that has been in use for three years pumping daily, and for much of its time night and day, has been completely free from any trace of sand for the greater part of the time.

It only remains to say that Messrs. Stewarts & Lloyds, Limited, Glasgow, Birmingham, and London, are the makers of the strainer.

MOTOR ROAD ROLLERS.

Barford & Perkins' motor road rollers have been very greatly in request during the past twelve months for making and repairing military roads at the different Fronts. The sizes that have been mostly used are the 8-ton and 9-ton rollers. In almost every



case the machines have been fitted with paraffin engines, and very excellent reports have been received as to the usefulness of the rollers. The illustration shows one of these machines at work on the shores of the Mediterranean.

METAL WELDING.

THE BARIMAR PROCESS.

As within the next few months it is of the utmost importance that every agricultural implement in the kingdom should be available for use on the land, if the aims of the Board of Agriculture and the Food Controller are to be realised, the attention of the farming community cannot be too strongly directed to the modern system of scientific welding, by means of which broken machinery (of any metal) may be quickly restored equal to new. Barimar Scientific Welding experts, of 10 Poland-street, Oxford-street, London, who have successfully replaced the German specialists in Britain, are making special arrangements to deal promptly with agricultural machinery in view of the urgency of the situation.

During the past few years the Barimar welding business has grown to such an extent that it has gone beyond the limits of the motor trade, to which at the outset it was confined, with the result that to-day the firm's factories handle work for H.M. Admiralty, War Office, Crown Agents for the Colonies, Royal Ordnance and leading munition works, Royal Aircraft factory, armament constructors, shipbuilding yards, railway companies, municipal bodies, collieries, and Britain's leading engineering firms. The company's work covers repairs of all kinds—large and small—and such is their organisation that fractures in all parts of the kingdom can be executed with a minimum loss of time.

Protection of Concrete in Cold Weather.—Experiments have been conducted at the Lewis Institute in Chicago to determine the effectiveness of manure as a protective covering for freshly-laid concrete to prevent disastrous results in cold weather. In these tests slabs of concrete exposed to outdoor conditions were covered with 2, 4 and 6 in. of fresh manure obtained from a livery stable. The results proved that the 4-in. and 6-in. layers had high protective qualities and were sufficient to afford the concrete a protection against a drop of 25 or 26 degrees in temperature. The manure should not be allowed to come in direct contact with the freshly-laid concrete.

Works Projected by Local Authorities in 1917.

Schemes which in normal times may have been regarded as desirable, expedient, or even necessary, have been reduced under the stress of war to the position of a mere catalogue dependent for fulfilment upon the vision of that peace that shall revive industry and re-establish progress in municipal enterprise. For this reason the information contained in the following pages lacks the fulness to which we have been accustomed, and also to a measurable extent the interest we have hitherto claimed for it. Constructional works, except those that serve the purposes of the nation, are at a standstill. To a large extent labour is diverted from the paths of peace into the field of war. So many municipal engineers and surveyors, the members of their staffs, and employees are serving in the Army and the Navy that the works projected are of necessity reduced to a minimum, and even these are carried out under constantly increasing difficulties. It will be unnecessary, therefore, to say more than that we have used every effort to make the record appended as complete as possible, and that we have received, as indeed we always have, a ready and hearty assistance from our correspondents in the compilation of these pages.

Aberdeen (Mr. JOHN GORDON, ASSOC.M.INST.C.E., burgh surveyor and tramways permanent way engineer).—It is probable that no new schemes of any magnitude will be proceeded with, and that only maintenance and absolutely necessary works will be carried out. The maintenance work will include the ordinary routine work of street and road repairs, the necessary repairs to sewers, and keeping in thorough working order the tramway permanent way. This latter will include the repair or renewal of several junctions which are getting into bad condition. With regard to any works which may be proceeded with on the termination of the war, the city council have not yet considered the matter, but in this connection the following schemes must receive first consideration—viz.: Duplication of part of the main outfall sewer; various extensions of the tramway system already authorised by Parliament; an extension northwards and southwards of the esplanade along the sea beach, as authorised by the Act of 1907; repaving certain streets, as authorised by the Act of 1915; the construction of an improved access between the two northern districts of the city; and the prevention of coast erosion.

Aethwy, Anglesey (Mr. J. KERSHAW, surveyor to the rural district council).—The chief work under consideration by this council is the reconstruction of the sewerage of Llanfair P.G., Anglesey, including new waterworks. The present system of sewerage is for waste water, &c., only, but water-closets have recently been allowed to be connected. The matter was so important that a section has already been relaid, but a very minimum gradient is available. The council have also constructed a lengthy sea wall at Penmon, Anglesey, from the design and under the supervision of the surveyor. A large housing scheme is contemplated at the termination of hostilities.

Aldershot (Mr. FRED. C. UREN, surveyor to the urban district council).—The restrictions imposed upon local authorities in regard to expenditure have prevented the council from embarking on any works of importance. Appended is a list of the chief works which the council contemplates carrying out on the termination of the war—viz.: Erection of sixty working-class houses; road widening in Newport-road, Church-lane East, and Ayling-lane; erection of preparatory school; extension of the sewage farm; new elementary schools; town planning; and the question of provision of tramways.

Alton, Hants (Mr. G. BERTRAM HARTFREE, F.R.SAN.I., M.INST.C.E.I., surveyor to the urban district council).—The projected schemes include proposals for further works of surface and spring water drainage at the conclusion of the war; waterworks extension; private street improvements and other works delayed by the war.

Ardsley (Mr. J. MORLEY, engineer and surveyor to the urban district council).—During the past year considerably more surface tarring of roads was carried out with a view to economy, and in view of the result, the same method will be employed again this year. It is proposed to supersede the existing steam plant at Brodelley sewage works by a complete electrical pumping scheme. Public and private conveniences are to be erected at the Stanley-road depot.

Barnet (Mr. W. B. CHANCELLOR, M.I.M. AND CO.E., engineer and surveyor to the urban district council).—The works to be undertaken in 1917 include the reconstruction of the High-street or Great North Road. The works contemplated on the termination of the war are: Refuse destructor, tar-macadam and asphalt works; extension of the housing estate (fifty houses); the town planning of Totteridge and Arkley (2,400 acres); the sewering of Totteridge; and the making up of several new streets.

Barrow-in-Furness (Mr. W. C. PERSÉY, borough engineer and surveyor).—With regard to work proposed to be carried out during the ensuing twelve months, owing to the depletion of men and staff, very little more than the absolutely necessary routine work will be done. The widening of Mill-lane, at an estimated cost of £3,000, will, however, be proceeded with, as this is required by the Admiralty. The chief works in contemplation at the termination of the war, and estimated cost, are as follows: New secondary school, £70,000; heat engines laboratory, £1,150; new elementary schools, £30,000; painting of schools, £1,650; tar-macadam playgrounds to new elementary schools, £1,350; new police station and courts, £16,000; tripe-dressing and gut-scraping sheds at abattoirs, £2,125; new pavilion, Biggar Bank, £3,500; completion and laying out of public park, including the provision of tennis courts, £3,450; completion of road on Biggar Bank, £650; fencing and laying out portion of Vickerstown Park, £600; tar-macadam plant, £1,000; road repairs, £8,000; private street works, £12,168; new roads and road widenings, £5,630; refuse destructor extension, £3,000; underground convenience, Cornwallis-street, £850; motor garage at store-yard, £350; electrification of sewage pumping plant (completion of), £350; laying out of roads, Devonshire-road hospital, £400; steel hoppers for clinker crusher, refuse destructor, £200; street works on Risedale estate, £1,715; and restoration of stonework, town hall, £300.

Bedale (Mr. T. W. METCALFE, surveyor and sanitary inspector to the rural district council).—Beyond the ordinary routine work of the department, the only works projected for the ensuing twelve months are the improvements to sewage disposal works and laying half a mile of new sewers at Bedale, and laying additional sewer at Aiskew.

Belper (Mr. THOMAS FENN, surveyor to the urban district council). Providing that labour and materials are available the following matters are intended to be carried out during 1917—viz.: The surfacing of part of Derby-road and Derby-road bridge length with tar-macadam; metalling of the main and other roads as usual; tar-spraying of roads and paths; renewal of a portion of path in King-street; rounding off of Green-lane corner; the resurfacing of the approach road to the swimming baths; painting of the superintendent's residence; renewal of fittings needed to one of the engines at the outfall works; improvement to the outlet of the sedimentation tank

and the painting of Springwood Cottage. The duplicating of a portion of the 9-in. pumping main is abandoned for the present as labour is not available.

Bilston (Mr. VINCENT TURNER, ASSOC.M.INST.C.E., engineer and surveyor to the urban district council).—The council are cutting works down to bare necessities, and Mr. Turner himself is leaving in the course of a few days to take up a commission in the Royal Engineers for road service in France. During his absence Mr. W. T. Edgar Fellows, surveyor of the Wilmslow Urban District Council, has very kindly undertaken to supervise the work of his department.

Bognor (Mr. OSWALD A. BRIDGES, M.I.E.S.N.I., engineer and surveyor to the urban district council).—No public works of any importance will be carried out in this progressive seaside town until after the war. The urban council are ready to proceed with extensive improvement schemes when things are normal again, and not until then. The money market will no doubt be an important factor, which will decide when schemes can be carried out to the advantage of local authorities. When money is cheap again schemes can be pushed forward. At Bognor the first scheme to be undertaken will be the lengthening of the sewer outfall pipe, and the building of a new pumping station, estimated to cost £10,000. The widening of the Promenade Marine Drive and new sea wall, opposite the Pier Head, will involve an expenditure of £8,688. The building of 150 cottages for the working classes is also contemplated, as well as the construction of a bathing pool opposite Rock Gardens, where bathers can enjoy a sea bath under ideal conditions at all states of the tide. This scheme it is anticipated, will form a great feature of the sea front and be a good source of income. The outer wall will form a promenade, and in the evenings the bathing pool will be used as a lake, and be encircled with festoons of electric lights, and electric gondolas will ply for hire upon the water, decorated with electric lights. The winter garden, which will be just behind the bathing pool on the south side of the Promenade, will contain accommodation for a large concert-hall overlooking the sea, with verandahs and sun shelters for those in delicate health, reading, billiard, and tea rooms. Medicated baths upon the latest and most up-to-date principles will also be provided. On the lawns in front of these buildings will be constructed a bandstand of elegant design which can be encircled with glass shelter screens to protect those wishing to enjoy the strains of the best music by military bands during windy or inclement weather. Nearly £700 is spent annually on rock lands, which have proved a source of much profit to the town in past years. There is no place on its size which caters better for the enjoyment of its visitors than Bognor. Its unrivalled sands are another great asset to the town.

Boston, Lincs (Mr. G. E. CLARKE, M.I.M.C.E., borough surveyor).—All work is cut down to the lowest possible limit, and the only project at present authorised after the war is a destructor. As regards the docks, large improvements were contemplated, but it will still be some time before they can be carried out. The borough surveyor is fully occupied with Admiralty work.

Bridgend (Mr. WILLIAM BEVAN, surveyor and inspector of nuisances to the urban district council).—[illegible] council; propose after the war to build new council offices and a fire brigade depot.

Buckfastleigh (Mr. L. M. WILLIAMS, engineer and surveyor to the urban district council).—The council will continue the necessary work to keep the main and district roads in order, as well as a certain amount of tar-spraying. Some of the roads have been badly damaged by excessive weight of traffic in hauling coal thereon, and as soon as this is finished the council intend to repair the roads and put them in good condition. After the war a small housing scheme will be carried out.

Burnham (Mr. WM. H. CROWTHER, engineer and surveyor to the urban district council).—The council have nothing of importance in contemplation for this year. After the war, however, it is intended to proceed with the construction of a new service reservoir, and the laying of 2 miles of 12-in. cast-iron main, with other works in connection therewith.

Bury (Mr. J. AINSWORTH SETTLE, ASSOC.M.INST.C.E., borough engineer and surveyor).—For the duration of the war all works of any magnitude are held up. At the close of the war a busy time will be experienced in road and street work, as all except absolutely necessary maintenance is held in abeyance. Nearly all the office staff are with the Forces, and a number of workmen and others from Bury have joined recently for road making in France. The work to be taken in hand at the termination of the war will include the resewering of a large district, the provision of a housing scheme, and the usual highway and street improvements.

Chard (Mr. FRANK NICHOLSON, interim district surveyor to the rural district council).—There are no works of particular interest contemplated more than the employment of one or two batches of 100 prisoners of war, each for quarrying and breaking macadam. The council intend to take over the quarries under their direct management. Neither is there anything of particular interest definitely settled upon after the war, with the exception of again taking up a Road Board scheme of resurfacing and improvement of 16¼ miles of main road, at a cost of £20,266, with an alternative scheme costing £24,000, both of which were put forward at the beginning of last year, but were dropped owing to the war. Other works will be the making good of work on roads severely restricted at present through labour shortage.

Chelmsford (Mr. PERCIVAL T. HARRISON, ASSOC.M.INST.C.E., borough and water engineer).—The only work in contemplation, apart from routine, is the completion of urgent works of water supply and sewerage, and the adapting of additional land at the sewage farm for sewage disposal purposes. The presence of thousands of troops largely increases the work of the different departments, already handicapped through shortage of labour. The following list of schemes has been forwarded in response to the Local Government Board inquiry: Wood paving; widenings in Galleywood-road, Sandford-road, and Lady-lane; tar-macadam resurfacing scheme; public conveniences in recreation ground; refuse destructor; new sewerage scheme for borough; new waterworks pumping station; and making up several new streets.

Cheltenham (Mr. J. S. PICKERING, M.INST.C.E., borough surveyor and water engineer).—All work which could possibly be suspended is being held over during the war. In compliance with the notice from the Local Government Board, particulars of works contemplated after the war have been forwarded in accordance with the following list: Additional water-filtration plant; reconstruction of sewers in South-Eastern district; new effluent and steam-water outfall from sewage farm; new carriers at sewage farm; wood-block paving—London-road; reconstruction of outfall sewer to Barn sewage farm; cleaning out of Pittville Lake; concrete piling, Dowdeswell reservoir landslide; and concreting floor of large service reservoir. No definite undertaking has been given to carry out any of the above work, but there is no doubt that some of the most pressing will have to be put in hand when more normal conditions prevail. Owing to the shortage of team labour, an electric vehicle is being purchased for the removal of house refuse. It is also proposed to purchase a tractor for hauling tar-macadam, the necessary trailers having been already obtained. The war does not appear, on the whole, to have so prejudicially affected Cheltenham so much as many other towns. Being a residential and health resort, it has attracted many residents, and the town is fairly prosperous. The corporation have continued to cater for visitors by giving first-class daily concerts during the winter, and the usual outdoor entertainments in the summer. A great response has been made by the townspeople with regard to voluntary help in connection with the war. Eight Red Cross hospitals have been established, and are continuously occupied by about 1,000 wounded men.

Chepstow (Mr. WILLIAM TURNER, surveyor to the rural district council).—Owing to economic considerations, the roads have lapsed into a very bad condition, and it will be necessary eventually to strengthen them by putting in good foundations.

Chiswick (Mr. EDWARD WILLIS, ASSOC.M.INST.C.E., F.S.I., F.R.SAN.I., engineer and surveyor to the urban district council).—During the past year practically no capital expenditure has been incurred, but minor improvements have been carried out at the sewage disposal works, including the laying of about half a mile of 2-ft. gauge portable railway, the construction of 11-h.p. motor tractor for the same, and the fixing of a clinker tar-macadam mechanical mixer. It is doubtful if any permanent improvement works will be carried out during the continuance of the war, but the following is a list of works which have been approved by the council for submission to the Local Government Board, and it is hoped that some, if not all, will be started immediately after peace is declared: The erection of a new wharf, retaining walls, locomotive crane, and portable railway, at or near the river depot; the provision of a river embankment, and promenade 100 ft. wide, from the present sewage disposal works at Chiswick to the Polytechnic Boathouse at Grove Park, including a sunken portable railway for conveying raw materials to factories, and raised tennis courts and gardens, facing the river. The provision and laying out of a pleasure and recreation ground at Strand-on-the-Green; the removal of the present old properties adjoining Kew Bridge, and the provision of a new approach road to Strand-on-the-Green and Kew Draw-dock; the wood-paving of Heathfield-terrace and Wellesley-road to form a by-pass to the Great Western Road; the wood-paving of Turnham Green-terrace to link up the wood paving of Bath-road with Chiswick High-road. The improvement and widening of Sutton-lane, for which Parliamentary powers have already been obtained; the general improvement and widening of Strand-on-the-Green, for which various properties have already been purchased; the laying out and completion of the existing burial ground; the erection of the motor-wagon shop, and facilities for the changing of different bodies.

Colne (Mr. T. H. HARTLEY, borough engineer and surveyor).—The construction of new works entailing expenditure is still held up, owing to the restrictions of the Local Government Board. The staff of the borough engineer and surveyor's department is still more depleted than even last year, owing to all men of military age having joined His Majesty's Forces. Some over military age have joined the new Roads Battalions in France, and those who remain are executing the ordinary routine work. Steady progress is meanwhile being made in the new town planning scheme for 877 acres of the borough. The authority of the Local Government Board has been obtained to proceed with the further stages. Plans and estimates are completed for the construction of further percolating beds at the sewage works, and when the restrictions on public expenditure are withdrawn a start will be made on the works proposed. A scheme long overdue for the duplication of certain main intercepting sewers is well in hand. The ordinary maintenance and construction of tar road surfaces is being proceeded with as far as the limited supply of labour will permit. Steps are being taken for the letting-off of certain parts of the recreation grounds to allotment holders for the increase of the food supply, principally potatoes and other vegetables.

Coulsdon and Purley (Mr. ROBERT CHART, M.I.M. AND CO.E., surveyor to the urban district council).—Unless the war is over it is not proposed to carry out anything not absolutely necessary. The surveyor has prepared a schedule of works to be undertaken after the war, including sewer extensions, £3,349; surface-water outfall scheme, £25,000; making up of private streets, £29,840; and highway improvements, £5,968.

Croydon (Mr. GEORGE F. CARTER, M.INST.C.E., borough engineer, surveyor, and water engineer).—The Local Government Board have agreed to the completion of a part of the works in hand at the South Norwood sewage works. These include the bringing into operation new sedimentation tanks, sludge pumps, and mains. Letters have been addressed to the owners of nearly 100 acres of unoccupied lands for use as allotments during the war, and these are being pegged out and allotted. At the Beddington sewage farm a large area of land is being specially dealt with for cultivation, and a motor plough has been purchased in connection with the work.

Doncaster (Mr. F. OSCAR KIRBY, M.SC., ASSOC.M.INST.C.E., borough surveyor and water engineer).—It is proposed during the present year to continue the carrying out of street improvement work in one or two special cases. A considerable amount of renewal of tramway track is to be undertaken, together with the experimental reconstruction of some highways. The preparation of an extensive housing scheme is also engaging the attention of the corporation. On the termination of hostilities it is proposed to proceed with the sewerage and sewage disposal scheme, street improvement schemes, additions to the refuse destructor, and various other proposals of less importance.

Droitwich (Mr. HY. HULSE, M.I.M. AND CO.E., borough engineer and surveyor).—The tar-painting of road surfaces will be about the only special work to be carried out this season. The projected works after the war include the cleaning and deepening of the section of the river Salwarpe situate in the borough and the provision of additional working-class dwellings, which will probably be the first works to be put in hand.

Dublin (Mr. MICHAEL J. BUCKLEY, borough surveyor and waterworks engineer).—The rebuilding of the destroyed area in the city, which will, it is anticipated, be carried out by the property owners concerned as soon as the Government deals with their claims for compensation, is the most urgent work of the future. In conjunction with this work the corporation propose carrying out some street widenings in the streets abutting on the destroyed property, and for which a unique opportunity has now arisen. The next important work to be carried out will be that connected with the housing of the working classes. The corporation have negotiated successfully with an American syndicate for a loan of £250,000 for this purpose, and, as the Local Government Board have sanctioned the borrowing of £84,000 of this amount, the most immediate schemes will now be pressed forward, and others taken up later on when the board sanction the balance of the loan. Next in importance comes the construction of the new storage reservoir at Roundwood (£134,000 loan), in connection with which more than half the work has been carried out. The council have various other works in view, but, owing to the impossibility of obtaining money to carry them out, there is no chance, so far as can be seen, of dealing with them during the ensuing financial year. As to the chief works in contemplation on the termination of the war, the most urgent will be the housing of the workers. An important engineering work will be the completion of an extensive main drainage system, which has already cost about £600,000. A few small portions remain to be finished, amounting to about £30,000. Among other schemes which may come before the council is a proposal to construct a bridge across the Liffey to replace the present unsightly metal structure (toll bridge), the lease of which has recently fallen in to the corporation. This proposal would be in line with the scheme, already decided on, for the widening of Liffey-street, leading from this bridge up to Henry-street, one of the leading business centres in the city. The erection of public baths and wash-houses for the north side of the city is also proposed

Dundee (Mr. JAS. THOMSON, city engineer).—There is no intention of entering upon any extensive works during the war, but preparations are being made for the commencement of many important works at the termination of the war, with a view mainly to giving work to men returning from the Front. These works include business premises at High-street, under the central improvement scheme; housing schemes; erection of phthisis pavilions at King's Cross Hospital; the completion of improvement at Seabraes; the erection of observatory on Dundee Law, and a [illegible] road leading thereto; and the erection of a baby clinic at Constitution-road. The aggregate estimated cost of these works is £200,000.

Dunfermline (Mr. P. C. SMITH, burgh engineer).—The coming year promises—as the past—to be one of exceptional activity. The Naval Base at Rosyth is within the city area, and for the provision of housing accommodation for the dock employees a large building scheme is now in progress. Over 600 houses are either occupied or in the course of completion, while an additional 1,000 houses will be constructed during the year. To meet this development the city is extending its water and gas services, forming new and widening existing roadways, involving an expenditure of £40,000. Apart from the works in the Rosyth area, the town council do not contemplate any scheme of magnitude or importance.

Durham (Mr. J. T. PEGGE, P.A.S.I., city surveyor).—The council have suspended as much work as possible, and the shortage of cartment and labour is acute. A wise policy has been adopted in view of more strenuous times ahead. Money unspent on public works has been invested in War Bonds, being thus kept in reserve. Beyond about £2,000 to be spent in remaking roads affected by abnormal motor traffic, a small street widening, a new urinal, the necessary part of a set of conveniences and shelters at the Wharton Park, temporary shelters for motor-'bus passengers, necessary sewerage works and replacements, and allotments for food purposes, it is not intended to do more.

Dursley (Mr. J. G. WENDEN, clerk to the rural district council).—The council have in view the execution of the following works at the conclusion of the war: The provision of a water supply for the parish of Cam; works of sewerage and sewage disposal for the parish of Kingswood; the completion of a scheme of sewerage and sewage disposal for the parish of Wotton-under-Edge, which was approved by the Local Government Board before the war broke out; the erection of working-class dwellings at Wotton-under-Edge, for which a site has been purchased; and the provision of a new burial ground at Wotton-under-Edge, for which an option for the purchase of a site has been acquired.

Eastbourne (Mr. W. WALKER, surveyor of highways to the rural district council). Hampered as the council have been by the extreme difficulty of obtaining material of any description, the highway work has been carried on on very modest lines, and it is not anticipated that any advance will be made during 1917. Generally, the policy of the council will be to preserve intact as far as possible. More tar-spraying will probably be done than usual, and local material utilised where available. Several sections of road have been seriously damaged by military traffic, but in each case adequate reparation has been made for the time being, and the work is proceeding. As regards works in contemplation for after the war, nothing definite has yet been decided upon; but schemes of road widening and drainage are under consideration on the Seaford side of the district, and it is hoped that the new coast road between Eastbourne and Bexhill may then be proceeded with. There should be no scarcity of work in the district.

Exeter (Mr. THOMAS MOULDING, M.INST.C.E., city engineer and surveyor).—So far as at present known no work will be carried out during the year other than ordinary routine work. Should peace be declared, it is possible that some of the work which has been deferred because of the war will be continued.

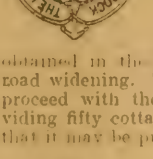
Gillingham, Kent (Mr. JOHN L. REDFERN, borough engineer and surveyor).—Should the war terminate during the ensuing year, the council intend to put in hand a considerable number of works which have been laying up, namely: The construction of a 36-in. storm-water culvert through H.M. dockyard, the diversion of the Pier-road intercepting sewer, and the widening of Park-road and Woodlands-lane, and making up a number of private streets. Until peace is declared work will consist of maintenance. About 40,000 gallons of deodorised tar will be used for surface spraying. A new plant for making tarred stone is being installed.

Glasgow (Mr. THOS. NISBET, ASSOC.M.INST.C.E., master of works and city engineer).—It is considered unlikely that any works of importance will be proceeded with until after the war, in view of the policy of the corporation to restrict all unnecessary expenditure, and of the difficulty in obtaining the necessary labour and material. There is no doubt that at the termination of the war a number of works will require to be undertaken in connection with street widenings, hospitals, halls, and baths and wash-houses.

Godmanchester (Mr. C. MAYFIELD, borough surveyor).—The best after-war work that could be undertaken would be to dredge the gravel beds out of the river, which at present form a great obstruction, and also to resurface the roads which run roughly parallel with the river with concrete, using either tar or cement as a binder, preferably cement.

Gosport and Alverstoke (Mr. HERBERT FROST, engineer and surveyor to the urban district council).—No special work is contemplated to be carried out during the current year beyond really necessary routine work. Definite schemes are in abeyance, among the most pressing being a new ferry landing, Gosport—Portsmouth, which includes a brow and pontoon to replace the old masonry "Haid"; a new road connecting Forton with Hardway; making up a number of private streets; scheme for new sewers and connections for houses to sewage system; renewal of destructor cells; increasing steam-engine power at the air-compressing station, augmented with gas engines; completion of a joint small hospital; and laying out and improving new recreation grounds, &c. It is not anticipated that, pressing as some of these items are—some of them have already received the provisional approval of the Local Government Board—any of these works will be actually taken in hand until after the termination of the war.

Grantham (Mr. J. H. DIXEY, M.INST.C.E.L., M.INST. MUN. AND C.E., M.R.SAN.I., borough surveyor). There are no special works contemplated in this borough beyond the maintenance and repairs to highways, which are being very badly damaged by the extraordinary military traffic. The estimated expenditure on main roads is £4,392 for the year ending March 31, 1918.



Grays (Mr. ARTHUR C. JAMES, ASSOC.M.INST.C.E., engineer and surveyor to the urban district council).—Work in this district is at present entirely confined to necessary routine matters. Works to be undertaken at the close of the war include surface-water drainage, for which Local Government Board approval was obtained in the Spring of 1914, and a considerable road widening. The council have also resolved to proceed with the preparation of a scheme for providing fifty cottages, or more as may be required, so that it may be put into operation as soon as possible.

Crimsby (Mr. H. GILBERT WHYATT, M.INST.C.E., borough engineer and surveyor).—The only work which is likely to be proceeded with during the current year is the construction of the tuberculosis dispensary, with maternity and children's clinic adjoining. The contract has been secured by Messrs. Hewins & Goodhand, and orders to proceed with the work are being issued this month. Many other schemes are held over until the termination of the war, including the middle length of the Weelsby-road improvement, together with the bridge underneath the Great Northern Railway; the construction of sewers in the Ainslie-street district; the extension of the electricity works; the paving with granite of certain streets where the traffic is too heavy for tar-macadam; the carriage bridge over the Great Central Railway at the Central Market; a bridge (probably on the Scherzer rolling principle) over the Alexandra Dock at Corporation-road; an elementary school in Victoria-street North; a shelter and refreshment room in the Bradley Wood; an additional gallery in the Free Library, as well as other minor works.

Hailsham (Mr. G. B. FAIRCHILD, A.R.SAN.I., highway surveyor to the rural district council).—Owing to difficulties in obtaining sufficient metal for ordinary road repairs, the council, at present, anticipates little beyond ordinary maintenance. The damage by military traffic to the Eastbourne to Hastings road, in the parish of Hooe, will be made good by resurfacing and tarring, at an estimated cost of about £1,200, towards which the Road Board will contribute £720.

Halesowen (Mr. G. SPURR, engineer and surveyor to the rural district council).—In response to the Local Government Board's inquiry as to works which are needed for the area within the council's jurisdiction, and which might be undertaken by them on the conclusion of the war, the following suggestions have been made: Twenty-five road widenings; three new thoroughfares; 40,000 super. yds. footpath paving; new council depot and stables, with possibly refuse destructor; and a housing scheme. The district is of such a character as to make many improvements desirable, especially having in view the council's ultimate aim of obtaining unifying urban powers for the whole of their area. The carrying out of such a number of constructional works would, however, involve heavy expenditure. Seeing that expenditure of this nature would be undertaken (if at all) mainly because of the anticipated unsettled condition of labour throughout the country at the end of the war, and would thus be of State rather than local importance, it would have to be clearly ascertained, before making any commitments which would unduly hamper the financial resources, that the proposed outlay would not be entirely regarded as devolving upon the council as a local authority, but would merit, as to finance, weighty concessions from the National Exchequer.

Herefordshire (Mr. G. H. JACK, M.INST.C.E., M.S.A., county surveyor).—The energies of the roads department of the Herefordshire County Council will be taxed to the utmost in an endeavour to restore the highways to the good condition which they had reached prior to the war. There were 474 roadmen engaged in the county in 1914. At the end of 1916 this number was reduced by one-half. This, together with the difficulties of obtaining material and the scarcity of hauliers, has perforce reduced the expenditure from £44,097 in 1913-14 to approximately £35,000 in 1916-17. The requirements of the roads in twelve months' time will not be far short of £50,000 above the normal pre-war expenditure. The work of strengthening the trunk roads, with the assistance of the Road Board, which was commenced in 1913, will, it is hoped, be finished during this year, in spite of the war. The rebuilding of several small bridges will be undertaken as soon as cicumstances permit. The construction of two new schools and repairs to many existing school buildings will also be proceeded with.

Hessle (Mr. WILLIAM COULSON, surveyor to the urban district council).—In present circumstances the works to be undertaken by this council will only be slight during the present year. The works to be undertaken will be a moderate amount of tar-spraying, two or three small works of road widening, and the cultivation of certain land for the production of food. With regard to works to be undertaken after the war, the following may be included: Road widening in several parts of the district; an improvement scheme in the centre of the town, clearing away a considerable amount of old property; improvement of recreation ground; the provision of working-class dwellings; and the asphalting of a considerable length of footpaths in the district not now so paved.

Heywood (Mr. JAS. B. NUTTALL, borough surveyor).—Only absolutely necessary maintenance works will be undertaken by this corporation during the ensuing twelve months. On the termination of the war the chief works to be undertaken, some of which are already in hand, but postponed, are: Reconstruction of main roads and improvement of secondary roads; private street improvement works; intercepting sewers and storm overflows; construction of new roads to outlying districts; housing and town planning scheme; laying out of Hopwood Recreation Ground; underground convenience and lavatories; extensions at the electricity works; new bridge over the river Roch; and the renewing of lengths of tramway track.

Hinckley (Mr. E. H. CRUMP, ASSOC.M.INST.C.E., surveyor and waterworks engineer to the urban district council).—It is intended to instal a centrifugal pump to deal with sewage at the sewage works, and lay about 1 mile of water main. After the war the erection of further workmen's dwellings, a new destructor, the widening of Castle-street, and extensions to sewers and water mains are contemplated.

Holland, Lincs, South Division (Mr. A. W. LLOYD, M.I.M. AND CO.E., surveyor).—The county council have approved an estimated expenditure of £6,500 in respect of the maintenance and repair of the main roads in this division. This sum includes surface tarring 30 miles of road by contract, tarring 20 miles of footpaths, and various road repairs.

Horsham (Mr. R. RENWICK, surveyor and water engineer to the urban district council).—No new works are contemplated either during the year or, so far as is at present known, upon the conclusion of the war.

Killarney (Mr. G. A. E. HICKSON, M.INST.C.E.I., engineer to the urban district council).—The council are about to carry out a small scheme for the disposal of storm water in order to relieve the sewers of the town, and also in connection with this to make some slight extension to the existing sewerage. The estimate for these works amounts to £600, and this is practically authorised by the Irish Local Government Board. The council obtained a loan of £6,500 for housing the working classes, of which there remains an unexpended balance of about £3,000, but this money will not be available until after the war.

Kiveton Park (Mr. FRANK HEWITT, F.S.I., engineer and surveyor to the rural district council).—During 1917 the only works likely to be attempted are as follows: New cells and boilers at Dinnington refuse destructor; small road improvements (two); new filter bed at Anston sewage works; tar-macadam and tar-spraying work; small water main extensions; the making up of a couple of private streets; the completion of Recreation-row 15-in. and 18-in. surface-water sewer; and a public mortuary at Dinnington. A number of important schemes, some of which have already been before the Local Government Board, are in abeyance until after the war, including the following: Sewage disposal works extensions, Dinnington (£5,000); private street works (20); bridge rebuilding; sewerage and sewage disposal works at Wales Bar, Waleswood, South Anston, West Thorpe, Harthill and Woodall; road improvements (12); depot buildings; privy conversions; artisans' dwellings; and sewage disposal works extensions, Wales (£3,400). Developments due to new colliery workings will probably necessitate the preparation of a town planning scheme for part of the district in the near future.

Leeds (Mr. W. T. LANCASHIRE, M.INST.C.E., city engineer and surveyor).—In response to an inquiry from the Local Government Board asking what work could be put in hand after the cessation of hostilities, the following statement was presented: Street improvements, £17,309; reconstruction of unhealthy areas, £25,464; private street works, £33,022. Sewerage, £26,146—only work in connection with military hospitals or munition works is being carried out at the present time. Works to be carried out by other departments of the corporation were included as follows: Electric lighting (Mr. C. N. Hefford; manager, electric lighting department), £418,000; sewage disposal (Mr. G. A. Hart, sewerage engineer), £178,000; central technical school (Mr. J. Graham, secretary for education), £154,000; tramway renewals (Mr. J. B. Hamilton, tramways manager), £50,000. The city engineer is engaged in preparing town planning schemes as follows: (1) Buckingham House; (2) Harehills, Roundhay and Crossgates; (3) Osmondthorpe; (4) Gledhow; and (5) Moortown. The sanction of the Local Government Board has been obtained to prepare schemes for Nos. 1, 2, 3 and 4 [illegible]

particulars have also been deposited for No. 5, but the Local Government Board inquiry has not yet been held. It is hoped to push forward these schemes, so that useful work may be provided after the war in the construction of new wide main roads or the widening of existing roads, if at any time the state of the labour market requires such provision.

Leicester (Mr. E. George Mawbey, M.Inst.C.E., borough engineer and surveyor).—It is not possible to state what works will be carried out during the present year, but the following are projected works, which were postponed owing to the war and the deferring of the sanction of loans—viz.: Seven small sections of tributary sewerage and trade water sewers, estimated cost £10,500; widening and sewering of Lutterworth-road, £2,000; widening of Welford-road, £3,800; new sanitary conveniences, £630; and storm-water sewage disposal scheme, £120,000. It has been decided to proceed as expeditiously as possible with the preliminary work for extensive town planning schemes, and it is already in an advanced stage.

Leigh (Mr. Percy Morris, A.M.I.M. and Co.E., surveyor and engineer to the rural district council).—The council intend to proceed with the following schemes during the year, in addition to the usual road works, of improvement and maintenance—viz.: Sewerage and sewage disposal works for the township of Culcheth; scheme for supplying the township of Astley with water from a borehole, and a new sewerage pumping scheme for Astley.

Lincoln (Mr. R. A. MacBrair, M.Inst.C.E., city engineer and surveyor).—Immediately after the declaration of war all proposed works were put on the shelf, the council being satisfied with finishing those they had in hand. Among the most important works under consideration were the town planning scheme, and the erection of some 800 workmen's dwellings. The council were also considering the inclusion of some outlying townships where a large number of houses were being erected; while they had in view additions to the electricity works and the public abattoir.

Llanfrechfa, Upper (Mr. M. R. Jones, surveyor, inspector and waterworks manager to the urban district council).—The roads in this district have been somewhat neglected in past years. The work of making up and the execution of certain improvements in connection therewith would have been commenced this year but for the fact that suitable macadam could not be obtained. A sewer about a mile in length is to be constructed immediately the necessary labour is available. Minor improvements will be executed to the reservoir, including the laying of a cast-iron main from a well to the reservoir. It is also proposed to fix in different parts of the district two pressure-reducing valves and waste-water detecting meters.

Llangollen (Mr. J. W. Hughes, A.R.San.I., surveyor, water engineer and sanitary inspector to the urban district council).—At present the council are not considering any large undertakings. For this year the only suggestion is for an open-air swimming bath on the side of the river Dee, for which the surveyor is preparing a scheme. As to work after the war, the proposal is to provide a new reservoir for water supply at a considerable higher level, so as to supply the houses on the hillsides, and thereby encourage the building of good residential houses. A preliminary scheme was prepared, just before the war broke out, by Messrs. Berrington & Son, of Wolverhampton, the estimated cost being about £15,000. This project now stands over until after the war.

Lochgelly (Mr. Alexander Lumsden, burgh surveyor and sanitary inspector).—Owing to the restrictions regarding expenditure no new works have been agreed to during the war. It has, however, been agreed to carry out several works immediately on the termination of the war. These include new outfall sewers at a cost of £2,751; new sewage purification works, £8,252; several new street improvements, £7,170; total, £18,173. Plans, specifications and schedules are at present in course of preparation for the whole of the foregoing works.

London, Camberwell (Mr. William Oxtoby, M.Inst.C.E., borough engineer).—In consequence of the restrictions in regard to expenditure, nothing will be undertaken unless it is absolutely necessary.

London, Finsbury (Mr. P. G. Killick, borough surveyor).—It is not anticipated that any extensive works will be carried out by the council during the present year. Several important schemes, including a rebuilding scheme on the Northampton estate and the Metropolitan Water Board offices, are hung up for the duration of the war. The paving renewals will also be kept down to the minimum.

London, Woolwich (Mr. J. Sutcliffe, borough engineer and surveyor).—The only work of any moment which it is intended to carry out in the near future is the repaving of a portion of Beresford-street with wood blocks, but only to the value of about £700. The borough engineer has received instructions to proceed, when opportunity affords, with the town planning of the borough, and with sheds for rolling stock at the various depots. Other works in contemplation are the resurfacing of Footscray-road, the widening of Bexley-road, and a scheme for a new sewer for the Nightingale-place district. In addition, a very extensive list of schemes that might be undertaken has been compiled at the request of the Local Government Board, as work after the war; but this schedule is merely an embryo at the present time.

Longford (Co. Longford).—Mr. Daniel Leary, engineer, states that this council have decided to provide for the following works after the war—viz.: The completion of the late scheme of labourers' cottages, comprising about fifteen houses at a cost of £140 each; the drainage of Ardagh burial ground, at a cost of £123; and sewerage works at Lanesboro', at a cost to be estimated. The council have only in hand such works as are found to be urgent, such as repairs.

Lytham (Mr. A. J. Price, engineer and surveyor to the urban district council).—Like most other places the works to be carried out at Lytham are dependent upon the duration of the war. So long as the war lasts the Local Government Board will prevent their being carried out, though the patriotism would also prevent the spending of money on municipal works of improvement when Imperial needs are so much more pressing. The list of works sent up to the Local Government Board, which are to be taken in hand when the war is ended, is as follows: Open-air bathing pool, promenade and marine lake, at an estimated cost of £30,000; electricity works, £30,000; assembly rooms, baths and public offices, £30,000; golf pavilion, £2,000; street improvements, £4,975; public conveniences, £700, and recreations grounds, £10,000.

Mansfield (Mr. Waude Thompson, Assoc.M.Inst.C.E., borough engineer and surveyor).—No works of any magnitude are proposed until the termination of the war. A sewer extension in Southwell-road, and the resurfacing of Sherwood-road with tar-macadam will be carried out, and the town planning scheme for the borough will be proceeded with. After the war a large amount of work will be imperative, including a housing scheme, new mixed school, technical school, extension to sewage disposal works, several street widenings in the centre of the town, and a large number of private street improvement works. The laying out of new cricket ground, central fire station, new town hall, and the extension of the refuse destructor are also in contemplation.

Market Harborough (Mr. Herbert G. Coales, Assoc.M.Inst.C.E., F.S.I., engineer and surveyor to the urban district council).—The council do not propose to carry out any public works during the year, but Mr. Coales is getting on with a town planning scheme.

Markinch (Mr. Robert W. Todd, burgh surveyor and sanitary inspector).—The town council's engineers have received instructions to prepare plans for an extension of the water storage, the work to be commenced immediately the war is ended. Ground has already been acquired for the purpose.

Middlesbrough (Mr. S. E. Burgess, M.INST.C.E., F.R.SAN.I., L.R.I.B.A., borough engineer and surveyor).—The following are the principal works which will claim attention during the year: The completion of the Snowdon road outfall sewerage scheme, which provides for the sectional drainage of a considerable portion of the borough. The total cost of the scheme is £60,000, of which half has been put in hand by the special sanction of the Local Government Board, at a cost of about £32,000. This work is nearing completion. It is expected that the pumping station, together with the large main interceptor sewers, will be in operation by early summer. A scheme for the treatment of venereal diseases has been inaugurated, and the borough engineer has been instructed to go into the matter and prepare alternative proposals for hospital and administrative requirements in connection therewith. The after-war proposals for important arterial road construction are also in hand at the request of the Local Government Board, and estimates totalling upwards of £63,000 are being prepared, together with the necessary plans, so that the required consent may be obtained in order that, when possible, the work may be put in hand without delay. The maintenance and upkeep of the highways and footpaths, together with the main sewers, will, as far as possible in the circumstances of war time, be carried on as usual, and other business pertaining to this department of the corporation will be gone on with. The provision of land in suitable plots for cultivation under the Government scheme is also to be put in force at once.

Mitchelstown (Mr. PATRICK COUGHLAN, M.I.M. AND C.E., engineer to the rural district councils).—The projected works for the ensuing twelve months are the completion of the rural housing scheme and the water supply scheme—provision of wells and pumps, at an estimated cost of £1,000. The Fermoy Board of Guardians will undertake the completion of sanitation scheme for hospitals, at an estimated cost of about £1,500. The works intended to be carried out after the termination of the war by the Mitchelstown No. 2 Rural District Council include the provision of additional plots to labourers' cottages and the erection of additional cottages.

Morley (Mr. F. TURNER, B.SC., ASSOC.M.INST.C.E., borough engineer and surveyor).—During the early part of the year it is intended to extend considerably the plant for dealing with the sewage sludge. Apart from this, the work carried out will be routine work.

Newburn (Mr. THOMAS GREGORY, engineer and surveyor to the urban district council).—After the war two or three road widening schemes are to be undertaken, and also a further housing scheme.

New Malden, Surrey (Mr. REGINALD H. JEFFES, ASSOC.M.INST.C.E., engineer and surveyor to the urban district council).—Owing to the restrictions imposed by the war no works are proposed to be executed during the year, except purely routine work, which, owing to depleted staff, is reduced to the lowest possible limits. The council have not yet considered what works they propose carrying out on the termination of the war. They have put the Cultivation of Lands Order in force in the district, and already about 20 acres of land have been applied for and allotted to various applicants. The council also propose to purchase seed potatoes for the use of allotment holders in the district. All this work has kept the surveyor's department in a state of considerable activity.

Northampton (Mr. ALFRED FIDLER, M.INST.C.E., borough engineer and surveyor).—It is very unlikely that any works will be carried out except such as are absolutely necessary, and the works which may have been projected will be postponed until after the war. This applies to the following works: Storm water and overflow relief sewers; Far Cotton sewage and surface water drainage, Kingsthorpe main drainage; and Houghton-road improvement.

Norwich (Mr. ARTHUR E. COLLINS, M.INST.C.E., city engineer).—In common with other towns, all work possible is being held up in Norwich, but certain schemes are under consideration, to be proceeded with at the close of the war, notably reconstruction of Carrow opening bridge across the river, and a riverside road from Carrow to Thorpe Station. The probable cost will be about £20,000. Work is now in hand for a gravel-washing and screening plant for the production of materials to be used for gritting tar-painting on carriageways and footpaths in place of using granite or other stone chippings, the cost of which, under the present circumstances, together with the difficulty of obtaining supplies, make their use almost prohibitive. Further, it is found that the local gravel, when properly washed and screened, is at least as satisfactory as the more expensive stone chippings. The closing of various refuse tips around the borders of the city is rendering imperative the consideration of a proper system of refuse disposal. It is likely this will take the form of the provision of four or five depots, to which the ordinary wagons will cart, there tipping into tanks, each holding not less than twelve cub. yds. Motor wagons (electric or otherwise, of 12 cub. yds. capacity) will be loaded from these tanks by the opening of bottom doors, and the vehicles will proceed with their loads to the point of disposal. Much of the refuse of the city is at present tipped on to marsh lands about 3 miles down the river, with very satisfactory results except from the point of view of cost. The provision of proper machinery for dealing with this would greatly reduce the cost, but, apparently, a modern destructor, having regard to the steam-raising power, would be cheaper than tipping on the marshes, even with the better facilities necessary. In the event of there being a real shortage of work after the close of the war, the flood reduction and navigation improvement works of the river would probably be quite sufficient to absorb all unemployed labour of this neighbourhood.

Oxford (Mr. W. H. WHITE, M.INST.C.E., city engineer).—The only special works at present in prospect are the completion of the reconstruction of the remaining roads on which the motor omnibuses run. The tramways have been already removed and the roads traversed by them, 10¾ route-miles, have been reconstructed during the past two years.

Penrith (Mr. W. S. LYTHGOE, highway surveyor to the rural district council).—The council's district covers an area of some 300 square miles, and has 430 miles of district roads. For the present the council have cut out all improvements, and are just carrying on the bare maintenance of their highways. They have under consideration the purchase of a portable power-driven rock drill to use in their various quarries to replace the slow and laborious system of hand-drilling. They also contemplate the purchase in the near future of a tractor and tipping wagons. During the year it is proposed to relay trial lengths of road, over which there is a medium amount of traffic, with tar-macadam, made with local limestone from the council's own quarries. The council have already put in water schemes in all their principal villages, and, naturally, sewages and disposal works are to follow. They had several of these schemes under consideration before the war, and the works no doubt will be carried out when things are normal again. The council have still several waths to bridge, and this work will be taken up after the war.

Portsmouth (Mr. ARTHUR W. WARD, ASSOC.M.INST.C.E., borough engineer).—There is no municipal work of importance now being proceeded with under the borough engineer's direction, except the extensions to the infectious diseases hospital, which is nearing completion.

Rochdale (Mr. S. SYDNEY PLATT, M.INST.C.E., borough surveyor).—All expenditure on new works of a permanent character is stopped by the Government. The staff of the borough surveyor, assistants and workmen is seriously depleted, leaving him barely sufficient assistance to carry on the routine work of the borough. The consideration of works after the war is suspended until

...is assisted as matters will then depend largely ... financial ... the country.

Risca (Mr. A. J. Davies, surveyor and engineer to the urban district council).—The council intend making ... streets in the earliest possible opportunity ...

Sandown, I.W. (Mr. Lester G. Dasher, M.I.M. and C.E., surveyor to the urban district council).—The council have under consideration many ... and important schemes to be carried out on the ... as soon as the war, but these are as yet in a ... stage.

Skegness (Mr. R. H. Jenkins, engineer and surveyor to the urban district council).—During the year the ... undertaking will be transferred to the ... under the Act of 1915, in accordance with the award of the arbitration tribunal. The council are to pay to the gas company annually a sum equal to 5 per cent. on the amount of the award until twelve months after the termination of the war, or such ... time as they may be allowed for borrowing the required amount. The costs of the council have been exceedingly heavy in acquiring this undertaking, which has involved the promotion of two Bills, opposition and arbitration, and the rates will have to bear a very considerable burden in order to repay short-term loans. In consequence of this and the war no ... will be carried out in new works during the ... although the usual amount of road surface will ... tarred. Certain private streets are to be ... after the termination of the war.

Stoke-on-Trent (Mr. A. Burton, M.Inst.C.E., F.S.I., borough surveyor).—At the present time, and during the continuance of the war only routine work will be ...

Street (Mr. William J. Goode, M.I.M. and C.E., surveyor and water engineer to the urban district council).—During the spring it is hoped to commence ... works in connection with the 9-in. cast-iron water supply main from the intake works, which is ... from external corrosion, owing to ... exceptional conditions across peaty ... Improvements to the highways will be ... and more extensively. The council are ... the erection of a public slaughter-house, and it is probable that an additional housing scheme will be put forward at the termination of the war. The ... of electric power in the new low-level pumping ... has proved a great saving and convenience ... the old engine.

Swanage (Mr. William H. Peachey, Assoc.M.Inst.C.E., engineer and surveyor to the urban district council).—The council have in view during the year the completion of a ... at Corfe Castle laying several ... of cast-iron pumping main, and the provision of pumping ... to supply Swanage and ... with water, subject to the necessary loan sanction being obtained.

Swinton and Pendlebury (Mr. Henry Entwisle, M.I.M. and C.E., M.R.San.I., engineer and surveyor to the urban district council).—Several important works ... been carried out in connection with the war. Sanction for ... has already been given by the Local Government Board for the following, and it is hoped that the ... will be proceeded with on the termination of the war. Works of sewerage, including the construction of ... brick culverts and pipe ... at an estimated cost of £10,000; the erection of ... houses for the working classes at an ... cost of £2,000. Works projected: Re-covering ... filter-beds and subsidiary ... existing sewage ... by extending ... during operations at an ... cost of £1,000; paving ... with concrete ... at an estimated cost of £1,000; completion of ... widening and reconstruction of Dean's-road, at an ... cost of £1,000; additions to refuse destructor ... by the provision of ... at an ... cost of £1,000.

Waterford (Mr. Cecil J. Lewis, engineer, surveyor ... to the urban district council).—The ... carrying out during the year any ... of importance at present ... the Local Government Board on the termination of the war the ... will probably include the following ... The lighting of the city by electricity; the paving of the quays by a part-grant from the Road Board; ... baths; the laying of 7 miles of cast-iron 15-in. diameter water mains to supplement the present water supply, together with the enlarging of the existing ... and filter area.

Wembley (Mr. Clem R. W. Chapman, engineer and surveyor to the urban district council).—Acting as the burial authority, it will be necessary for the council, by some means or other, during the ensuing twelve months, to prepare an area for burials, the present ground being almost completely filled. A field of 11 acres was purchased at the beginning of the war, and it is proposed to lay out 3 acres of this, enclosing the ground with wrought-iron unclimbable fencing, with suitable entrance gates, together with the necessary footways and surface drainage, also the widening and improving of an old bridleway which forms the only access to the site. Plans are being prepared by the engineer and surveyor to the council for submission to the Local Government Board. The provisions of the Cultivation of Lands Order, 1916, will be pursued vigorously. Numerous schemes, including sewage disposal works, destructor, disinfector, and public and private street improvements are being held over until the termination of the war.

West Bromwich (Mr. Albert D. Greatorex, M.Inst.C.E., M.S.A., borough engineer and surveyor).—Beyond maintaining the highways, tramways, and other works as far as possible under the restricted regulations as regards men, the council do not propose executing any other work this year.

Windermere (Mr. Charles E. Hines, M.I.M. and C.E., M.R.San.I., surveyor to the urban district council).—All works, other than maintenance, have been suspended for the time being, but the council contemplate carrying out the following works on the conclusion of the war: (1) The completion of the sewerage and sewage disposal scheme, which was commenced in 1913, but suspended in 1916, when nearing completion, owing to shortage of labour and materials; (2) the construction of a cottage for the manager at the new sewage disposal works, £633; (3) the widening of the Windermere-Patterdale main road, and removal of dangerous corners at Chapel Ridding and St. Catherines, £553; (4) the removal of dangerous corner on the Rayrigg-road at The Green, £207; (5) the resurfacing of portions of the Windermere-Bowness main road, £4,166; (6) the diversion of the Windermere-Kendal main road at Bannerrigg, £1,596.

Wombwell (Mr. Wm. Quest, surveyor to the urban district council).—It is not proposed to carry out any special work during the ensuing twelve months. Something, however, will have to be done to provide additional ground for the cemetery; but as land for this has already been acquired, it is only a question of enclosing part or the whole of this land for the purpose. There are several schemes to be put in hand as soon as possible after the war, including additions and alterations to New Scarborough sewage works, several new sewers, sewer extensions, new mortuary, and at least three road improvements.

Ystradgynlais (Mr. T. Watkins, surveyor to the rural district council).—The council do not intend carrying out many new works during this year, as a good bit of money will have to be spent in restoring the roads after the heavy traffic in connection with the sewerage scheme, and the cutting up of the roads throughout the district to lay the sewers. It is proposed to reconstruct Ainon Bridge, and to widen Craigmaespica-road, Cwmtwrch. After the war the water supply will have to be increased to meet the requirements of the sewerage scheme, and additional storage tanks erected; a new road will be constructed between Abercrave and Coelbren. A Provisional Order has been obtained to enable the council to purchase the electric lighting undertaking; but this cannot take effect until six months after the war.

Prosperous Brighton Tramways.—Traffic receipts on the Brighton Corporation tramways for the past nine months have increased by £5,700, which is a record in the history of the undertaking. It is the more remarkable as the previous year was an unprecedented success. The prosperity of the past summer season was one contributory cause of the advance, but the principal element was the large daily traffic among munition workers employed in the district.

LAND FERTILISERS FROM HOUSE REFUSE.

LIGHTNING DUST MANIPULATORS.

We are a conservative people. We needed a war of the first magnitude to force us to admit the necessity of cultivating our land to the fullest possible extent, and, as a corollary, the urgent need of fertilising this land of ours. But now potash and nitrates are scarce, the former coming from Germany, and freight for transport of the latter being prohibitive, and the motor vehicle has ousted stable manure. We have fertilising material in inexhaustible quantities in our very midst, the contents of our dustbins, our house and town refuse. But for years we have been the money necessary for erecting plants to reduce house refuse to manure. These difficulties notwithstanding, the Metropolitan Borough of Bermondsey managed during last year to erect a plant of four dust manipulators at their depot at Rotherhithe. The war has also caused a scarcity of money in our Colonies. Yet during the past twelvemonth two Lightning Dust Manipulators have been erected in Australia, one at Woollahra and the other at Paddington, both suburbs of Sydney, and one has been erected at Devonport, in New Zealand. A number have gone to South America, one having been laid down in the city of Campos, in Brazil, one at Ribeirão Preto, and others in other cities of the South American Continent.

With the urgent need for fertilisers, inquiries for

INSTALLATION OF FOUR PATENT LIGHTNING DUST MANIPULATORS.

(Recently erected by Bermondsey Borough Council.)

foolishly throwing it away, tipping it down exhausted quarries, barging it out to sea, burning it in our dust destructors.

Captain Furse, of the Patent Lightning Crusher Company, Limited, the inventor of the Lightning Crusher and Pulveriser, was the first pioneer of a great industry. His motto was, "Give back to the land what came from the land," and he strenuously and ceaselessly advocated the utilisation by the borough councils of all refuse for fertilising purposes. Under the name of "Dust Manipulator," a modification of this wonderful pulverising machine has been in use for some years now for reducing practically unsorted house refuse to a fertiliser specially adapted for heavy soil, of which a great majority of our land is composed.

The first to appreciate the advantages of this invention was Mr. Arthur Harrison, borough engineer and surveyor to the Southwark Borough Council, who courageously caused a plant of two machines to be erected at the Manor-place depot. Within two years the plant was doubled, and so satisfactorily did it work that the year before the war over 20,000 tons of house refuse were sold as manure to the farmers of Surrey and Kent. Halifax, Bispham-Blackpool, Hove, Glasgow, St. Andrews gradually and at intervals followed suit.

Still, a system that should have been adopted all over the land was limited to the capabilities of an enterprising and intelligent few. Now there is a cry for the cultivation of land, a cry for manure. But the corporation of Hove only last year was not allowed to quadruple its plant because the Local Government Board would not sanction the necessary loan! And theirs is not an exceptional case. Owing to the veto of the Treasury, councils could not raise dust manipulators are now pouring in, and the demand for these machines may be expected rapidly to increase.

"Back to the land!" is the motto now.

Successful Sewer Dredging.—The Eccles Corporation sewers and drainage inspector, Mr. James Caine, has just received accounts of successful cleansing operations by the use of his appliances in the towns of Grantham and Warrington. Mr. J. H. Drew, borough engineer and surveyor of the former town, writes: "On taking up duties here a few months ago, I found a section of 9-in. and 12-in. sewer leading from a large fellmongery and leather-dressing works badly choked, and was informed there was frequent trouble with this sewer, which had to be constantly dredged. You kindly loaned me one of your 12-in. to 24-in. sewer ploughs and cleansers, and after a short trial my committee decided to purchase them. The writer afterwards recommended that your smaller machines be sent on trial for the 9-in. section of sewer, and so well did these do the work claimed for them that my committee agreed to purchase these also. No less than 5 tons 12 cwt. 2 qr. of lime deposit and other refuse was removed from the 9-in. and 12-in. sewers in a very short time, these having a length of 3,500 ft. I can thoroughly commend your patent sewer plough and cleanser to my colleagues as the most efficient sewer dredging appliances I have yet seen on the market." The borough engineer and surveyor of Warrington, Mr. Andrew M. Ker, writes: "Your machines are doing good work in this town, and are a far greater improvement on any yet adopted. They are a great success, and this corporation has decided to purchase them."

ROAD MAKING MATERIALS AND APPLIANCES.

MANUFACTURERS' REPORTS FOR 1916.

In reviewing the past year, as far as the maintenance of our roads has been concerned, one is impressed with the importance of surface tarring, and the extent to which it has relieved the difficult situation caused by the shortage of materials and the demands for economy.

A great many roads have been preserved for another year solely by this comparatively cheap and simple expedient, and in spite of the shortage of labour and haulage, and the difficulty experienced in obtaining speedy deliveries of materials, Messrs. Johnston Brothers, of 79 Mark-lane, E.C., have successfully carried out all their contracts, and have treated some millions of super. yards by means of their patent jumble-furnace boilers with Waithman reservoir [illegible]. This system of tar-painting by hand has again proved an unqualified success, and in many districts where this work had been carried out in the previous year the surfaces were found to be almost as good as when first treated.

Although the difficulties of 1916 were great, those to be encountered in 1917 will be still greater; but the need for tar-painting will also increase, and Messrs. Johnston are taking energetic steps to enable them to carry out the contracts that may be placed with them in their usual speedy and efficient manner.

In addition to the above contract work, many county, city, borough, urban and rural district [illegible] have been supplied with these double-furnace boilers and Waithman apparatus, and excellent results have been achieved. One authority, in deciding to purchase a machine that had been sent on approval, stated that on the first day of working a speed of 1,200 super. yds. per hour was attained, and results still better are anticipated when the men get more accustomed to the work.

When a good surface has been obtained by tar-painting, it is economy to keep it good instead of allowing it to wear into potholes—which soon spell ruin—and for this purpose Smart's Midget patching outfit has proved very popular. One of our leading county surveyors who had some of these outfits stated that his only regret had been that he had not more of them. Needless to say, these regrets were soon dispelled by a further supply of Midgets.

There has been a great demand for the Welsh granites for which Messrs. Johnston Brothers are the concessionaires, and until quite recently all demands [illegible] but of late, owing to the heavy demands of the Road Board for materials for national purposes, some disappointment has been unavoidably caused [illegible] are doing their best to fulfil all contracts.

* * * *

It is a striking testimony to the merits of Messrs. R. S. Clare & Co.'s materials, and to the sound repute in which they are held by surveyors and authorities interested in road treatment generally, that the past season has yet again marked a big increase in sales over the already large figures attained in previous years.

Constructional work has of necessity once again [illegible] and motives of economy have called for an increase in the palliative treatment of existing surfaces. This has caused a yet greater quantity of Tarco to be required.

Bi-Tarco has again fully maintained its position as a standard binder, which it well deserves in view of its wonderfully adhesive qualities, due, it is claimed, to the [illegible] of pure bitumen and other [illegible] which it contains.

Messrs. Clare are, of course, also supply in very large quantities a special grade of Bi-Tarco to surveyors who prefer the grouting method of construction, and this material has largely been adopted for the construction of [illegible] roads, in which connection it has received enthusiastic praise.

It is well to mention that both Tarco and Bi-Tarco comply in every respect with the requirements of the High Explosives Department of the War Office.

Tarvalon Ointment and Paste has again found favour with gamekeepers and [illegible] employers [illegible] for [illegible] preparation for removing all the grease and grime from the hands, without the [illegible] effect upon the skin.

* * * *

Messrs. Thompson & Southwick, Limited, The Foundry, Tamworth, are manufacturers of the "Acme" patent rotary tar-macadam machines. They have, however, sold none for the year, as they have had to put them on one side for special work in which they are engaged.

The firm have a number of the machines at work in different parts of the country, and these are giving satisfaction. They have just received a report from one of the principal cities in this country in which one of their machines is being used, and this states that it is working in an entirely satisfactory manner.

The firm think there is not the least doubt but that there will be a big demand at the close of the war for this machine. It may be mentioned that they are manufacturing the machines either fixed or portable.

* * * *

Regret is expressed by Messrs. John Yates & Co., Limited, Aston Manor, Birmingham, at the recent decrease in road making, as it affects so many of their oldest friends; but, as it is generally admitted, it must of necessity be one of the first industries to recuperate after the war, "we hope," they say, "they may soon experience renewed prosperity." The firm are careful, so far as ever possible, to supply with a minimum of delay the requirements of such of their regular clients, both public authorities and contractors, as are doing any work, fully realising the great need they will have of their continued goodwill when peace is declared. Where they are compelled to claim their friends' indulgence as regards delivery, they endeavour to do so without giving umbrage by fully explaining the position, and so far have been met, without exception, with the greatest consideration, as everyone recognises the successful prosecution of the war as the paramount purpose of the day. The company have supplied considerable quantities of their manufactures in connection with military roads at home and abroad, and have been careful to make all possible arrangements here for coping to the best advantage with the great demands for the work they expect to arise at the close of the war.

* * * *

The Dussek Bitumen Company, Bromley-by-Bow, London, E., report that, although during the past year there has been a decrease in road making, a very satisfactory amount of work has been carried out with their "Trinidite" binder and "Bitite" grout for setts during 1916. They consider this has been due to the reliable work previously carried out with these materials, as not one of the sections laid with "Trinidite" have ever failed. On no single occasion, either, has it been necessary to relay any setts that have been grouted with "Bitite."

Both these materials have, the firm claim, been proved by practical experience to be the highest-quality materials of their kind on the market.

* * * *

The demand for the Ames' Patent "Adaptable" horse broom, manufactured by the Ames-Crosta Sanitary Engineering Company, Limited, 12 Victoria-street, Nottingham, has largely increased during the past year, owing largely to the extension of tar-spraying. This broom is now recognised as being one of the most efficient and economical for cleaning the surface of roads. Large numbers of these brooms are also being sent out to France for use on the existing roads and the new military and main roads under construction.

* * * *

Highways Construction, Limited, Finsbury Court, Finsbury-pavement, E.C., report that forty-one of their head office and depot staff have joined His Majesty's Forces, in addition to which four have been lent to Government Departments.

Owing to the war there were but few opportunities of securing contracts in 1916, but successful work has, however, been carried out at Barrow, Abertillery, Wolverhampton, and Kensington. Full advantage has been taken of the restriction on the execution of road-surfacing work to carry out research and experimental work, and the company looks forward hopefully to securing a large amount of work on the resumption of peace.

* * * *

During the past year the Anglo-Mexican Petroleum Company, Limited, Finsbury-court, London, E.C., have, notwithstanding the abnormal circumstances, maintained its imports and deliveries of Mexphalte and Fluxphalte for road making and industrial purposes. Mexphalte has now become so well known to surveyors and road engineers as a high-grade Mexican bitumen, that no further description need be given of it. Both for grouting and asphalt macadam construction it has proved entirely satisfactory wherever employed.

The development of Clinker-Mexphalte roadwork

has opened up a further prospect for its effective use, which promises to be considerably increased at the conclusion of the war.

Fluxphalte, the liquid bitumen for road surfacing, has also proved successful in use, its long life and durability as a dressing being a notable feature of this material.

* * * *

Messrs. Aveling & Porter, Limited, Rochester, inform us that their output of steam rollers, tractors, steam wagons, &c., has been much reduced during the past year, in consequence of the Government work which they have been called upon to undertake, and that only a portion of this reduced output has been available for the use of private customers. They are doing everything that the circumstances permit to supply new plant on order for road making work in this country, but, of course, their deliveries are limited on account of Government requirements, and are subject to the Ministry of Munitions classification of output.

* * * *

Messrs. Engert & Rolfe, Limited, of Poplar, have been wholly engaged in meeting war requirements for their special roofings, and asphalt work and road-work have played very little part in their year's activity. They are, however, pleased to say that road-work executed by them prior to the commencement of hostilities has behaved splendidly under most trying conditions of motor 'bus and military traffic, and expenses for repair have been conspicuous by their absence. The "Bituvia" system of asphalt-macadam grouted road crusts, specialised in by this firm, is stated to have justified all claims made for it. During the past year stretches were laid at Reading with most successful results.

Messrs. Engert & Rolfe, Limited, are working to their utmost capacity in an endeavour to meet the heavy demands made on them for materials for Government requirements, both direct by Government Departments or their contractors, for hospitals, huts, airship and aeroplane sheds, munition works of all kinds, stores, &c. Very large areas of asphalt work have been carried out, a considerable proportion in the special gritless asphalt in which this firm specialise, which ensures a sparkless floor, which is ideal for buildings in which explosives are manufactured or handled. The demand for their "Waterp" roofing (a "rubber" type self-finished roofing felt) has also been considerable, and over 10,000,000 sq. ft. were supplied for war purposes during 1916.

* * * *

In consequence of Government requirements, Messrs. Mann's Patent Steam Cart and Wagon Company, Limited, Hunslet, Leeds, were obliged during the past year to discontinue completely the manufacture of their light rollers and road appliances. The above holds good as regards motor vehicles also, except that in a number of cases the firm have built wagons to replace motors or horses which have been requisitioned by the authorities or for other special purposes.

* * * *

During the past year Tarmac, Limited, Ettingshall, Wolverhampton, have been to a very large extent engaged on the supply of Tarmac for important military work at the various military camps and depots, aerodromes, national factories, and so forth, the work being undertaken by the Road Board, acting for the military authorities. Preference has, of course, had to be given to work of military importance, and as a consequence there has been considerable delay and disappointment with supplies for the company's ordinary customers. The company acknowledges with gratitude that the various county councils and local authorities whom the company have been obliged to disappoint and put off have very kindly accepted the situation and agreed that absolute preference has been necessary to work of military importance.

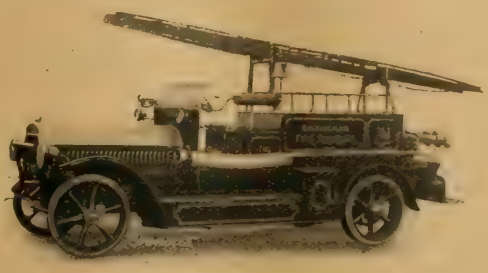
During the year 1916 the new works at Brymbo, near Wrexham, have been completed and put into operation. The company has now therefore three works in operation—viz., at Ettingshall, Wolverhampton; Denby, near Derby; and Brymbo, near Wrexham.

The new works in another town, despite delays caused by war conditions, would have been completed and available for the supply of Tarmac in the North of England for 1917-18 contracts, but the Road Board have taken these works over entirely for important military work, and until the works are released to the company again no material can be supplied from Middlesbrough to county councils or local authorities

PUBLIC SERVICE VEHICLES.

DENNIS BROTHERS' SPECIALITIES.

Messrs. Dennis Brothers, Limited, of Guildford, have the distinction of being the oldest established firm of motor manufacturers in Great Britain, and in the wonderful record of success that has always attended their productions, vehicles in municipal service play no inconsiderable part. This, indeed, is only what might be expected with a firm that has been so closely associated with the most notable developments in connection with self-propelled fire appliances. The turbine motor-pump fire engine, now an adopted standard almost everywhere, is essentially a Dennis speciality, for it was by the enterprise of Messrs. Dennis Brothers, Limited, that—like another well-known innovation, the worm-drive—it was first introduced. Since then many scores of these machines have been acquired by corporations, public authori-



DENNIS TURBINE MOTOR-PUMP FIRE ENGINE.

ties, and Government and other establishments throughout the world. Nearly all of the large fleet of motor-pump fire engines operated by the London Fire Brigade are of Dennis build, and of the total of about 150 vehicles of all kinds used by that organisation more than two-thirds have come from the famous Guildford factories. The machine shown in the illustration is a standard type as supplied to the Birmingham Corporation, being of 60 h.p., and having a pumping capacity of 400 gallons per minute, with a road speed of nearly 40 miles an hour.

In various other directions, too, Messrs. Dennis Brothers, Limited, have made a special feature of vehicles intended for public services, and the side-tipping lorry, also illustrated, is only one of a very large number of public service lorries of every possible type—omnibuses, prison vans, street-cleaning vehicles,

DENNIS SIDE-TIPPING MOTOR LORRY.

tower-wagons, &c.—built in the Dennis works, and distributed among more than a hundred county and municipal councils in this country and overseas.

For some considerable time past the whole of Messrs. Dennis Brothers' output, which has very considerably increased since the war, has been taken by the Government; nevertheless, due preparations are already being made for a return of more normal conditions, and in the firm's future plans it will be found that careful study has been made of the needs of municipal engineers. It is recognised that their requirements are quite distinct and apart from those of ordinary commerce, and that the municipal vehicle of the future must be specifically designed for its work, and readily adapted to varying purposes. In due course it will be found that Messrs. Dennis Brothers, Limited, have dealt with this particular problem with their characteristic resource and thoroughness.

The Legal Precedents of 1916 in Relation to Municipal Engineering.

By J. B. REIGNIER CONDER, a Solicitor of the Supreme Court.

During the past year questions have been decided by the Courts in connection with claims for damages against local authorities, contracts, highways and bridges, isolation hospitals, workmen's compensation, and waterworks. Among the localities concerned were Abingdon, Baslow, Beverley, Chertsey, Crouch End, Derbyshire, Halifax, Hornsey, Liverpool, Leiston-cum-Sizewell, Marylebone, Oxford, Ramsgate, Rawtenstall, and Teddington. Among the statutes considered were the Highways and Locomotives Amendment Act, 1878, the Riot (Damages) Act, 1886, the Isolation Hospitals Acts, 1893 and 1901, the Public Authorities Protection Act, 1893, the Rawtenstall Corporation Act, 1907, and the Defence of the Realm Acts. Of the cases noted five are decisions of the House of Lords, three of the Court of Appeal, eight of the King's Bench Division, and one of a County Court.

Claims for Damages.

In *Andrews* v. *Ramsgate Corporation* (vol. xlix., p. 284) the proprietor of the Paragon Baths, Ramsgate, claimed damages against the corporation for alleged injury to his business and premises. The corporation had begun to construct a concert-hall and Italian garden on the cliff adjoining the baths, and had excavated a quantity of chalk, which was thrown over the cliff, forming a heap in front of the baths. Mr. Justice Lawrence gave judgment for the corporation, on the ground that, although the plaintiff might have the right to take water across the foreshore, that gave him no claim against the corporation, who were not the owners of the foreshore.

In *Baldwin and Partners, Limited*, v. *Halifax Corporation* (vol. xlix., p. 657) the plaintiffs claimed damages for injury to their goods by flooding, during an exceptionally heavy rainfall. It was contended that the corporation had been guilty of negligence in the construction and maintenance of certain roads, catchpits, and sewers. Mr. Justice Atkin held that no negligence was proved with respect to the sewers, but that there had been negligence both in the construction and maintenance of the roads and catchpits, and he gave judgment for the plaintiffs for £500, being the amount at which it was agreed that the damages should be fixed in the event of the corporation being held liable.

In *Place* v. *Rawtenstall Corporation* (vol. l., p. 217) the corporation gave notice to the plaintiff to convert his pail-closet into a water-closet, and to connect same with a sewer. The notice not having been complied with, the corporation did the work themselves, for which purpose they constructed a combined drain to carry the sewage of the plaintiff's house and several other buildings, at a total cost of £54, of which the plaintiff's share was £11. He refused payment, on the ground that, in the carrying out of the work, his house had been injuriously affected by subsidence, for which he claimed damages. The matter was referred to arbitration, and the arbitrator awarded the plaintiff £46 damages, with costs. The corporation, however, denied liability, on the ground that, under sec. 257 of the Rawtenstall Corporation Act, 1907, they were not liable (in the absence of negligence) to pay any damages consequent upon the execution of work done "in default of the owner." But it was held by the Court of Appeal (affirming Mr. Justice Ridley) that, inasmuch as the work done included more than that which the plaintiff was required to do by the notice, the section did not apply, and the corporation were liable.

Contracts.

In *Leiston Gas Company* v. *Leiston-cum-Sizewell Urban District Council* (vol. xlix., p. 155) the company contracted with the council to erect and maintain gas lamps and standards in the streets and to supply gas for lighting the same. The contract was to remain in force for five years certain from August 1, 1911, being determinable by six months' notice, expiring July 31, 1916, or July 31st in any subsequent year. In consequence of an Order of the military authorities, under the Defence of the Realm Acts, only twenty-six lamps were lighted from January 1 to January 26, 1915, and none during the remainder of the year. The company, however, claimed for three quarterly payments to March 31, June 30, and September 30, 1915. Mr. Justice Low held that the contract was not determined, nor its performance made unlawful or impossible, by the Order of the military authorities, and that it was impossible to say how much of the charge was deferred payment for furnishing plant, and how much for gas consumed. He therefore gave judgment for the company for the amount claimed. This decision was affirmed by the Court of Appeal.

In *Metropolitan Water Board* v. *Dick, Kerr & Co., Limited*, the defendants, in July, 1914, contracted to construct some reservoirs for the board. The work was duly commenced, and was continued until February, 1916, when notice was served on the defendants by the Minister of Munitions requiring them to discontinue the work, and to comply with the requirements of the Ministry with regard to the plant and labour at their disposal. The work was accordingly stopped, and some of the plant was disposed of in accordance with the instructions of the Ministry. It was held by Mr. Justice Bray (1) that the contract was not abrogated; (2) that under the terms thereof the plant, on its arrival at the site, became the limited property of the board; but that (3) the defendants were not bound to repay the money received for the plant sold, inasmuch as they were acting as agents for the Ministry of Munitions. But he granted an injunction restraining the defendants from removing or receiving the proceeds of sale of any machinery except under the order of the Ministry.

Highways, Streets, and Bridges.

(*a*) ACCIDENTS.

In *Crane* v. *South Suburban Gas Company* (vol. xlix., p. 134) the company's workmen, while repairing a gas main in a public highway, left some molten lead in a ladle, which was placed in a fire-pail on a piece of ground, adjacent to the paved footway, on which the plaintiff (a young child) and other children had been playing. A passing boy accidentally knocked the pail over, and some of the molten lead was spilt on the plaintiff. It was held that the company were liable in damages for the injuries to the latter.

In *Hewlett* v. *Great Central Railway Company* (vol. xlix., p. 471) the company were authorised by a special Act of Parliament to maintain gates and posts at the entrance to their Marylebone station. The Act did not expressly impose on them any duty to light the place. The lighting of the street was carried out by the Marylebone Corporation, but by Regulations under the Defence of the Realm Consolidation Act, 1914, the lighting of the approach was so diminished that the plaintiff, a taxicab driver, failed to see one of the posts, and drove his cab into it. The case was tried by Mr. Justice Darling and a special jury, who awarded the plaintiff £50 damages. This decision was affirmed by the Court of Appeal, who held that the special Act did not absolve the company from the duty to act with reasonable care for the safety of the public, in the circumstances which might from time to time be existing. The House of Lords, however, allowed the company's appeal.

In *Turner* v. *Coates* the defendant was a farmer, and had occasion to transfer an unbroken colt from one farm to another. A boy was leading it along a highway connecting the two farms, the defendant following. The plaintiff (a nurse) was riding a bicycle on the road, and, the colt taking fright at the bicycle lamp, dashed across the road and knocked her over. It was held by the King's Bench Divisional Court (affirming a County Court judge) that the defendant was liable in damages, on the ground that an unbroken colt is likely to be dangerous on a highway, and sufficient care must be taken to prevent its doing damage.

(*b*) EXTRAORDINARY TRAFFIC.

In *Abingdon Rural District Council* v. *City of Oxford Electric Tramways, Limited* (vol. l., p. 455), judgment was given for the council for £350 for extraordinary expenses incurred in repairing two roads between Oxford and Abingdon, in consequence of damage done by the company's motor omnibuses between September 28 and October 4, 1915, during which period 135 omni-

buses had used the roads, the other motor traffic of comparable weight consisting of eleven covered motor vans, eight motor lorries, and two traction engines with trailers. It was contended on behalf of the company that a service of omnibuses run to serve the needs of a district could not be extraordinary traffic. They also denied the damage, and alleged that the roads had not been properly maintained.

In *Beverley Rural District Council* v. *Walker* (vol. l., p. 532) the surveyor's certificate contained no reference to any expense, average or otherwise, of repairing highways in the neighbourhood, with the result that the council's claim for £500 for extraordinary traffic expenses failed, and judgment was given for the defendant with costs.

(c) REPAIR OF RAILWAY BRIDGES.

In *Attorney-General* v. *Great Northern Railway Company* the House of Lords affirmed the decision of the Court of Appeal reversing that of Mr. Justice Warrington (noted in vol. xliv., p. 1059). The point at issue was the extent of the company's liability to repair the bridge carrying the highway from Hornsey-road to Crouch End over their line. Mr. Justice Warrington thought that the standard of repair was on the basis of the present-day traffic, but both the Court of Appeal and the House held that the standard was to be fixed according to the traffic that might reasonably be expected to use the bridge at the time of its construction. It will be remembered that, as regards canal bridges, an "up-to-date" standard of repair was fixed in *Attorney-General* v. *Sharpness New Docks, &c., Company* (vol. xlv., p. 234).

Isolation Hospital.

The decision of the Court of Appeal in *Attorney-General* v. *Derbyshire County Council* (referred to in vol. xlix., p. 124) was affirmed by the House of Lords (vol. l., p. 149). This case had reference to an isolation hospital established in 1897 for the Haddon Joint Hospital District by order of the county council, which order determined the representation on the committee of the county council and the local authorities within the united district, including (among others) the Baslow Urban District Council. In 1914 differences of opinion arose between the latter council and the county council on questions of policy. The county council thereupon made an order altering the constitution of the committee by increasing the number of their own representatives from two to nine, and reducing that of the urban district council to half a member, thus giving the county council such an absolute majority on the committee that they could entirely control its policy. It was held that, subject to their directly contributing to the hospital funds, the county council had power to vary the representation in the way they had done.

Public Authorities Protection.

In *Kauffmann Brothers* v. *Liverpool Corporation* (vol. xlix., p. 471) the plaintiffs' premises were damaged by riots, and they made a claim against the corporation under the Riot (Damages) Act, 1886. The corporation made an offer, which was refused, and more than six months later the plaintiffs commenced an action. The corporation pleaded the Public Authorities Protection Act, 1893, which limits the time for the commencement of proceedings in respect of any act, neglect or default in pursuance or execution of any Act of Parliament, public duty, &c., to six months after the act, &c., complained of. But it was held that this was not a claim for damages for any "act, neglect or default" within the meaning of the Act, and the decision of a County Court judge in favour of the plaintiffs was affirmed.

Waterworks.

In *Metropolitan Water Board* v. *Chertsey Union Assessment Committee* (vol. xlix., p. 156) it was held by the House of Lords that, in assessing to the poor-rate a piece of land on the bank of the river at Walton-on-Thames, used by the board as an "intake," no "enhanced value" ought to be put upon the land on account of its "special fitness" for the purpose for which it was used; but that, on the other hand, no reduction in the usual basis of assessment (viz., 4 per cent on the piece of land and 5 per cent on the cost of buildings) should be made owing to the board being able to borrow at less than 4 per cent.

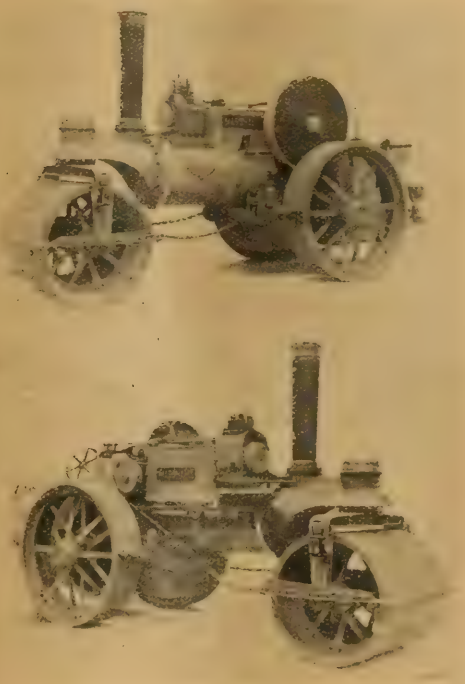
Workmen's Compensation.

In *Lay* v. *Teddington Urban District Council* (vol. xlix., p. 156) a scavenger employed by the council went (during working hours) to the lavatory of a public-house, and on returning to resume work fell and broke his thigh. It was held by the judge of the Kingston County Court that the accident was not an accident "arising out of and in the course of the employment," and judgment was given for the council.

"MARSHALL" ROAD ROLLERS.

A NEW TYPE OF ENGINE.

Our illustrations show an entirely remodelled and modern design of road roller recently placed on the market by Messrs. Marshall, Sons & Company, Limited, Britannia Ironworks, Gainsborough. It is made throughout from new patterns, in conformity with the best practice, and embodies patents and mechanical features exclusive to its manufacture. The object has been to produce an engine highly economical in fuel, in water consumption, of correctly distributed weight, and capable of thoroughly consolidating road surfaces on steep inclines and levels. The feature of convertibility from roller to traction engine, or *vice versâ*, has been scientifically achieved



VIEWS OF NEW TYPE OF "MARSHALL" ROAD ROLLER.

in the design, without impairing the characteristics of great constructional strength and durability. The accurate proportions of engine and boiler promote high mechanical efficiency, and ensure great tractive and driving power when the engine is employed for traction purposes, or for driving stationary machinery.

The cylinder base is planed and fixed on a pressed steel mounting with planed face, and the cylinder body, covers and steam chest are heavily lagged. The piston, adjustable crosshead, connecting rod and crankshaft follow closely on standard practice, but the crankshaft bearings are made of exceptional width, and are adjustable. They are also fitted with self-oilers of the latest "ring" pattern.

The boiler, which is of the usual locomotive-multitubular type, incorporates a "Marshall" patent cambered crown firebox, and is suitable for a continuous working pressure of 180 lb. per square inch. The boiler feed is maintained by a continuous action geared down feed-pump, and an automatic feed-water injector.

The power transmission is arranged on the four-shaft principle. The speeds obtainable are about 1½ and 3 miles per hour for road rolling, and 2 and 4 miles per hour when the engine is converted for traction work. The change speed gear wheels have machine-cut teeth. The first intermediate shaft is machined square between its bearings to carry the sliding portion of the two-speed gear. The bearings

are fabricated by continuous-action oiling rings, and all shafts are accurately machined and aligned.

The hind axle is made of a large diameter, and the keying for the winding drum centre and the bevel wheel of the four-pinion differential gear is arranged so that the axle can be easily withdrawn without removing the tender.

Several improvements combined in the fore-carriage ensure absolute freedom of movement for the front rollers, and allow them to accommodate themselves to uneven road in either forward or backward travel. By these means, and also the differential gear on the main axle, the roller is capable of being easily steered and manœuvred, and there is no tendency for the front rollers to "backlash." All the rollers have special cast-iron renewable rims, and the back rollers are fitted with patent spring scrapers. By the insertion of a pin the scrapers can be thrown out of action, so that frost spikes can be used if required. The track of the front rollers overlaps the tracks of the hind rollers by about 3 in. on either side. The front rollers are fitted with spring scrapers, front and back.

"Pickering" type governor, swivelling guide pulley for winding drum rope lead, and awning, are optional equipment, as are also a tubular feed water heater, barrel water tank, and fuel rack around tender top.

Several of these rollers have been put into commission in various parts of the country, and from the reports received from the users, there is evidence to show that the type is all that the makers claim it to be, and that it is a distinct improvement in this particular class of road engine.

SEWAGE AND SEWAGE DISPOSAL APPLIANCES.

MANUFACTURERS' REPORTS.

As a consequence of the continued restriction of municipal activities, there has been a further decline in the demand for sewage disposal and sanitary apparatus and ironwork for municipal works.

Several important contracts for sprinklers and sewage disposal appliances and sanitary ironwork have, however, been secured from municipalities. Some of these, by the Ames-Crosta Sanitary Engineering Company, Limited, 12 Victoria-street, Nottingham, are being carried out under difficulties, but many are in abeyance until the close of the war.

Good contracts have also been secured in the Dominions, among which may be mentioned a large contract for sanitary ironwork for Port Elizabeth; also one of the largest contracts for sewage distributors so far given out in the Dominions has been obtained from the City of Cape Town for the patent "Simplex" sewage distributors.

The efficiency of these distributors has been further demonstrated by their adoption and installation, together with other apparatus and ironwork, in military and internment camps, hospitals and convalescent homes, ammunition works, shell-filling factories, aerodromes, and other works carried out by the War Office, the Admiralty, the Office of Works, and other Government departments.

The carrying out of these contracts has to a large extent compensated for the temporary suspension of municipal work.

* * * *

During the past year Messrs. Tuke & Bell, Limited, the Carlton Engineering Works, High-road, Tottenham, N., have again been mainly occupied in the manufacture of filtering apparatus for the Government.

The firm have carried out a very considerable number of sewage purification schemes, but the bulk of these have been either for camps, munition works, or hospitals, including an installation for Lord Derby, the Secretary for War. They have supplied a considerable number of their "Ideal" revolving distributors in various sizes, of which a proportion have been for India, where this type of distributor is much appreciated. They have also supplied their water-softening plant and sewage ejectors, both for domestic purposes and in larger sizes, for various factories.

* * * *

During 1916 the Pulsometer Engineering Company, Limited, Nine Elms Ironworks, Reading, were particularly busy in steam-pumps (Hon. R. C. Parsons' patents) for pumping crude sewage.

These pumps have been in special demand for sewage works, military camps, national factories, &c., both in this country and abroad. The large number of orders received is an indication of the great need of a simple pump capable of elevating unscreened sewage, and of the success with which the Stereophagus pump has filled this want.

* * * *

The activities of Messrs. Jones & Attwood, Limited, Stourbridge, during the past twelve months embrace a large amount of work in sewage treatment and ejector plants for camps, munition factories, military hospitals, &c., and, when sanctioned by the Ministry of Munitions, for corporations also; also in the development of the activated sludge system of sewage treatment.

As regard the activated sludge process, five large plants have been installed and two others are in course of construction, while schemes for many parts of the world are designed and under consideration. Difficulties have been overcome, and the main features have been thoroughly proved and established.

The collaboration of Dr. Fowler's staff in the Frankland Laboratory of the Manchester University with the firm's engineering staff has enabled great progress to be made on thoroughly scientific lines. The problems already solved enable them definitely to announce that—(1) Aëration with the necessary circulation and mingling of the sewage and activated sludge is best secured by means of compressed air and diffusers; (2) very porous diffusers of great strength and uniform porosity can be supplied that will not choke with ordinary treatment; (3) by means of pulsating valves the volume of air required has been considerably reduced; (4) the sludge can be satisfactorily settled, returned to circulation, or withdrawn for treatment while the plant is in continuous operation without risk of septic action; (5) the sludge when treated is a valuable fertiliser, rich in nitrogen, and easily handled. This has been fully demonstrated by many experiments on agricultural and horticultural produce from delicate hot-house plants to root crops. Further particulars, illustrated by photographs, will be published in the near future.

Coast Sand Dunes (By Gerald O. Case, St. Bride's Press, Limited, 24 Bride-lane, E.C., price 5s.).—Mr. Case has done a valuable work in the writing of this book.—*Southport Guardian.*

State Expenditure on Housing.—A Treasury return which has been issued, giving particulars of State expenditure under the Housing Act of 1914, shows that the amount expended by the Commissioners of Works on the Woolwich housing scheme up to March 31st last was £806,660. Under an agreement made with the Scottish National Housing Company, £20,700 was advanced for the erection of dwelling-houses for Admiralty employees at Rosyth. The total authorised issue from the Consolidated Fund under the Act is £2,000,000, and the balance remaining at the end of the last financial year was £1,154,716.

Refuse Destruction in 1916.—During the year 1916 it has been almost impossible to make any appreciable headway as regards municipal destructors, and beyond clearing up the following contracts and handing them over to the municipalities concerned, Messrs. Hughes & Stirling, 6 Stanley-street, Liverpool, makers of the "Sterling" refuse destructor, have not carried out any large municipal work. (1) The borough of Widnes—3-cell back-fed destructor, with tar-macadam plant, buildings, chimney, engine, dynamo, mortar mill, stone crusher, &c., complete; (2) the borough of Sutton Coldfield—3-cell back-fed destructor in connection with the borough electricity works; our contract included for the complete plant, boiler, buildings, chimney, piping, accessory machinery, &c.; (3) the borough of Luton—6-cell back-fed destructor in connection with the borough sewage pumping station; (4) the urban district council of Teddington—4-cell front-fed destructor in connection with the council's sewage pumping station. In addition to the above work, however, the firm have carried out a large contract for Turin, Italy. This plant consists of twenty-four cells, top fed, with full steam-raising plant, electric fans, pumps, &c., the whole for supplying steam at high pressure to a large industrial factory. The entire plant was completed in October, 1916, and has a capacity of at least 360 tons. With reference to Canada, the company's licensees, Messrs. the Griscom-Russell Company, of New York, have been engaged upon a 12-cell top-fed destructor for the city of Toronto, and have recently completed various other destructor plants, notably for the cities of Halifax, Pittsburg, Berkeley, Cal., and Columbus.

The Legislation of 1916 in Relation to Municipal Engineering.

By J. B. REIGNIER CONDER, a Solicitor of the Supreme Court.

The only Acts that need be noticed in detail are the Local Government (Emergency Provisions) Act and the Naval and Military War Pensions, &c. (Expenses) Act. The first of these (as will be seen) deals with a great variety of matters, and contains an important qualification of some of the provisions of the second, which might equally well (if not better) have been incorporated in the latter itself. There are obvious disadvantages in the "referential" method of legislation, and it might surely have been avoided in the case of two Acts of the same Session passed (as these were) within two months of each other.

Only brief reference will be necessary to the Consolidated Fund, Expiring Laws Continuance, and Public Works Loans Acts.

Local Government (Emergency Provisions).

The full title of the *Local Government (Emergency Provisions) Act* is "An Act to make provision with respect to officers and servants of local authorities serving in or with His Majesty's Forces, and to make various administrative provisions with a view to economy in money and labour in connection with the present war," and it is a veritable miscellany of legislation.

With exceptions, which we shall indicate, it is to have effect only during the continuance of the war, and afterwards for such period or periods (if any), not exceeding one year, as the Local Government Board may fix.

It is divided into three parts, each dealing with a variety of subjects, arranged somewhat promiscuously, some of which it will be sufficient merely to indicate, whilst others call for more detailed notice.

PART I.

(*a*) PAYMENTS TO OFFICERS AND SERVANTS OF LOCAL AUTHORITIES IN NAVAL OR MILITARY SERVICE.

Any local authority may grant leave of absence to any officer or servant for as long a period as may be necessary to enable him to serve in or with His Majesty's Forces for the purposes of the war; and may (*a*) while he is so serving pay to him, or to his wife, or other dependants nominated by him, a sum which shall not, without the sanction of the Local Government Board, exceed his civil remuneration after deducting therefrom the amount of his naval or military pay and allowances; and (*b*) in the event of his death, for a period not exceeding twenty-six weeks after the date on which he is notified to his widow or other dependants as dead or missing, pay to her, or them, sums calculated at the same rate as those previously paid to him, her, or them. In fixing the sum to be paid to the widow or other dependant, regard is to be had to any pension or other sum payable out of any charitable fund; and it is not to be incumbent on the local authority to reduce any payment made to an officer or servant on the ground that during his service with the Forces he has become or becomes entitled to increased naval or military pay in consequence of receiving a commission or promotion in rank. These provisions are to apply retrospectively to the case of any officer or servant who before the passing of the Act (May 17, 1916) took service in or with His Majesty's Forces with the sanction or permission of the local authority; and any resolution, promise, sanction, or permission passed or given by a local authority to any such officer or servant, with a view to his so serving, is to be binding, but only to the extent to which it could have been passed or given if the Act had been in force. Where, however, before the passing of the Act a local authority resolved, promised, sanctioned, or agreed to make payments in excess of the amounts authorised by the Act, any such excess payments, up to the date of the passing of the Act, or such later date as may be determined by the Local Government Board, are to be deemed to have been lawfully made, and that board are to sanction their continuance in any case where it appears to them that the man joined His Majesty's Forces in reliance on such resolution, promise, sanction, or agreement, and that the amount of the excess is not unreasonable. But where the scale of payments adopted by a local authority does not exceed the scale of payments for the time being laid down for officers and servants of His Majesty's Civil Service serving with His Majesty's Forces, the sanction of the board is not to be necessary; and any payments made in accordance with such scale are to be deemed to have been lawfully made.

(*b*) PAYMENTS UNDER SUPERANNUATION SCHEMES.

If an officer or servant of a local authority dies while serving in or with His Majesty's Forces, or in consequence of wounds or disease received or contracted during such service, which prevented him from returning to the service of the local authority, the latter are to have, and to be deemed to have always had, power to make to his widow and other dependants such payments as could have been made to them under any superannuation scheme (whether established by statute or otherwise) in force in the district, had he been actually serving the local authority at the time of his death. All service by an officer or servant of a local authority in or with His Majesty's Forces for the purposes of the war is, for the purpose of any enactment providing for the superannuation of such officers and servants applicable to his case, to be aggregated and reckoned with his service as an officer or servant of the local authority; and, unless an agreement to the contrary has been made before the passing of the Act, he is to contribute to the superannuation fund (if any) the same amounts (if any) as he would have contributed if he had continued in their actual service, and received the normal remuneration.

(*c*) For the purposes of calculating the amount of such contributions and superannuation allowances, the amount of the salary or wages and emoluments during the period of service in or with His Majesty's Forces is to be deemed the amount which the officer or servant would have received during that period had he remained in the actual service of the local authority. Nothing in the foregoing enactments is to affect the provisions of the Elementary Teachers (Superannuation) Acts, 1898 to 1912, or of the Elementary Teachers (War Service Superannuation) Act, 1914.

PART II.

(*a*) MISCELLANEOUS.

This part contains provisions with respect to allowances to persons appointed as temporary substitutes, the notification of diseases, and the use of institutions, buildings, or other premises belonging to local authorities for the accommodation of sick or wounded sailors or soldiers, or for other purposes in connection with the war, and the employment of servants of the local authority in or about any institution so used, or otherwise (with the consent of the local authority) in connection with the war; also with respect to the expenses of the Metropolitan Asylums Board, the calculation of sums repayable to guardians out of the Metropolitan Common Poor Fund, and the amounts payable or transferable by the London County Council on account of pauper lunatics.

(*b*) MEDICAL OFFICERS AND INSPECTORS OF NUISANCES.

If a temporary substitute is appointed with the sanction of the Local Government Board to replace any medical officer of health or inspector of nuisances who has been granted leave of absence in accordance with the provisions of the Act to serve in or with His Majesty's Forces, the county council are to be liable, under the Local Government Act, 1888, sec. 24, subsection 2 (*c*), to pay half the aggregate amount of the sum paid by the local authority to the medical officer or inspector so replaced, or his wife or other dependants under the present Act, and of the salary of the temporary substitute.

(*c*) LOCOMOTIVES ON HIGHWAYS.

Sec. 5 of the *Locomotives Act*, 1898, is to have effect as if for sub-section (1) thereof (which provides for the number of attendants for locomotives) were substituted sub-section (1) of sec. 25 of the Local Government (Scotland) Act, 1908. Sec. 6 of the Locomotives Act, 1865, and sec. 2 of the Locomotive Threshing Engines Act, 1894, are to have effect as if the proviso to each of those sections were omitted. Sec. 6 of the Act of 1865 permits the use of steam engines for

placed and within 25 yds. of a highway, with the proviso that a person must be stationed in the road to signal the driver to stop, when necessary, and to assist horses and carriages, and that the driver must stop at proper times. Sec. 2 of the Act of 1894 relieves traction engines and machinery used for threshing within 25 yds. of a highway from the obligation to be kept in a building or behind a fence, with a similar proviso.

(f) LOCAL GOVERNMENT BOARD ORDERS, ETC.

Statutory Orders, &c., of the Local Government Board, instead of being sealed, may be given, altered or revoked by letter or other writing, signed by a secretary or assistant secretary of the board; but this provision does not apply to Scotland or Ireland.

(g) RETURNS AND REPORTS.

It is to be sufficient to lay a summary of local taxation returns before Parliament, instead of the returns required by the *Local Taxation Returns Acts*, 1877 to 1882, the *Municipal Corporations Act*, 1882, and the *Local Government Act*, 1888; and local authorities are not to be required to report to the Local Government Board the proceedings of Assessment Committees or to make to that board any return of the superannuation allowances and gratuities paid under the Police Local Officers Superannuation Act, 1896. The statements required by the London (Equalisation of Rates) Act 1894 and 1 7 need not be made out. The annual report of Part II. of the Housing of the Working Classes Act, 1890, need not be presented to the Local Government Board as required by sec. 44 of that Act. The Board of Agriculture and Fisheries are relieved of certain obligations, including the obligation to require county, borough, district and parish councils to send reports of their proceedings under the Small Holdings and Allotments Act, 1908. Metropolitan borough councils need not make annual returns of their proceedings, or lists of their members, under the Metropolis Management Act, 1855.

(h) AUDIT OF ACCOUNTS.

The powers given to the Local Government Board by sec. 3 of the Local Government Act, 1894, to modify the enactments as to publication of notice of audit of accounts of district and parish councils are extended to all accounts of local authorities, subject to audit by a district auditor, and the board are to have power to prescribe the period for which the accounts of any such authority to which sec. 5 of the *District Auditors Act* 1879, applies, are to be made up and audited.

(i) CASUAL VACANCIES AND ELECTIONS.

There are provisions with respect to the filling of casual vacancies on councils, boards of guardians, commissioners, &c., and the *Elections and Registration Act*, 1915, is amended. These provisions are permanent.

(k) NAVAL AND MILITARY WAR PENSIONS.

The contributions made by local authorities towards the administrative expenses of local district committees under sec. 2 of the *Naval and Military War Pensions, &c., (Extension) Act* (referred to below) are to be subject to the sanction of the Local Government Board. This provision is permanent.

(l) SALE OF FURNITURE

Powers are given to sanitary authorities to make, either alone or in conjunction with other such authorities, arrangements for the storage of furniture and effects belonging to persons serving in or with His Majesty's Forces.

(m) OMNIBUS ROUTES.

Omnibuses are not to use any route which has not been lawfully used by omnibuses plying for hire within five miles prior to March 1 1916, except with the consent of the highway authority, or, if more than one, every highway authority liable for the repair of the highways along which the route runs. Such consent may be given upon such conditions as the highway authority may consider fit. If, on the application of the Local Government Board such consent is unreasonably withheld, or if such conditions are unreasonable, the new route is not to be used without the consent of that board. Any one who drives an omnibus in contravention of this section, or who causes or permits any omnibus to be driven along any route in contravention of this section is to be liable to a fine not exceeding £5, or to a further penalty not exceeding £1 for each day on which such contravention is continued after the service of notice thereof by the council of the borough or district. There is however a proviso that the foregoing provisions are not to apply where a route is altered by reason of the temporary diversion of traffic on account of the breaking up of a road, or in pursuance of the directions of any police authority, or other directions lawfully given; nor to any omnibus in any case where the Admiralty, Army Council, or Minister of Munitions are of opinion that an omnibus service is necessary for, and is to be used by, munition workers or other persons engaged on Government war service. It is also provided that the section is not to be deemed to detract from any existing powers of highway authorities in regard to omnibuses. "Omnibus" includes every omnibus, char-à-banc, wagonette, brake, stage-coach, or other carriage plying for hire or used to carry passengers at separate fares.

PART III.

(a) INTERPRETATION, ETC.

"Local authority" means any person, or body of persons, who receive or expend the proceeds of any local rate, and any other public body which the Local Government Board may determine to be a local authority; but overseers of the poor are not to be included except by direction of that board. And where any such authority is a police authority, it is not, as such, to be deemed, for the purposes of Part I., to be a local authority. Except where the context otherwise requires, "allowances" means the separation allowances made to the wives and families and dependants of sailors and soldiers, and includes family allowances for soldiers living at their own houses in the United Kingdom. "Civil remuneration" includes the salary or wages and other emoluments which the officer or servant would have been receiving if he had remained in the actual service of the local authority.

There are also provisions for bringing teachers, officers and servants in elementary non-provided schools, and in institutions aided by the local education authority within the Act. For the purposes of the Act, or such of them as may be specified by the Local Government Board, service in connection with naval or military operations which the board consider may properly be treated in the same manner as actual naval or military service is to be deemed to be service with His Majesty's Forces.

(b) SCOTLAND AND IRELAND.

Provision is made for the application of the Act to Scotland and Ireland, with suitable modifications, including an amendment (which is permanent) of the Poor Law Relief (Ireland) Act, 1914.

Naval and Military War Pensions.

The *Naval and Military War Pensions (Extension) Act* provides that £1,000,000 shall be charged on and issued out of the Consolidated Fund in the year ending March 31, 1916, towards meeting the expenses of the Statutory Committee constituted under the Naval and Military Pensions, &c., Act, 1915 (referred to as "the principal Act"). The council of any county, borough, or urban district for whose area a local committee has been established under the principal Act may make such payments as they think fit towards the administrative expenses of any such local committee, and of any district committee appointed under that Act in their area. Power is also given to the council of any borough (including Metropolitan boroughs and the City of London), or urban or rural district which is, in pursuance of any scheme made under sec. 2 of the principal Act, a separate district, or is wholly or partly included in a separate district, for which a committee is appointed, to make such payments as they think fit towards the administrative expenses of the district committee. (As already stated, however, the Local Government (Emergency Provisions) Act provides that such contributions are to be subject to the approval of the Local Government Board.) Payments may be made out of any fund or rate out of which the expenses of the council are payable, and may be made subject to any conditions as to the application of such payments which the council think fit to impose. The Act is to be construed as one with the principal Act.

Consolidated Fund.

There are four Acts authorising the issue of money out of the *Consolidated Fund*. The aggregate amount authorised for the service of the year ending March 31, 1916, is £420,178,000, and the aggregate amount for the service of the year ending March 31, 1917, is £1,106,858,480.

Expiring Laws Continuance.

The *Expiring Laws Continuance Act* provides for the continuance until December 31, 1917, of (among other Acts) the Locomotives Act, 1865, the Motor Car Act, 1903, and the Local Government Elections Act, 1906. Any unrepealed enactments amending or affecting the

continued Acts are, in so far as they are temporary, continued to the same date.

Public Works Loans.

The *Public Works Loans Act* provides for the issue by the National Debt Commissioners of £1,500,000 for the purpose of loans by the Public Works Loan Commissioners, and £200,000 for the purpose of loans by the Commissioners of Public Works in Ireland; £200 of the loan of £10,000 to the Eyemouth Harbour Trustees, and portions of certain loans by the Commissioners of Public Works in Ireland to various borrowers are written off.

A MOTORISTS' MAP HOLDER.

Mr. C. H. Cooper, M.INST.C.E., the borough engineer of Wimbledon, has invented a weather-tight map case, for which he has taken out full patents. The maps are in strips on rollers, as shown in the illustration. Each strip contains a transparent portion through which the map strips beneath can be read. To obviate the blurring effect due to several transparencies being interposed between the map strip to be read and the observer's eye, the transparent material is as far as possible [illegible] [illegible]

WATERWORKS PLANT.

MAKERS' ACTIVITIES IN 1916.

The manufacture of special water purification plant for Government purposes has occupied much of the attention of Messrs. Bell Bros., Calder Iron Works, Ravensthorpe, Yorks., and this has of necessity greatly curtailed possibilities for work in any other direction. In spite of such drawbacks the firm have, however, constructed the large plant for the Nottingham Corporation, which is just about to undergo erection. Further plants have been supplied to the Holyhead Water Company, to the Aberavon Corporation, and a few smaller places. A special point that will interest our readers is the fact that the Leicester Corporation have placed an order with the company for plant to treat 6,100,000 gallons per twenty-four hours of the Derwent water supply, thus falling into line with the decision arrived at by the Nottingham Corporation. A considerable number of municipal orders which have been placed with the firm will not be executed for an indefinite period. In these times manufacturers' requirements are greatly increased, owing to the need of river and other water supplies being purified in great quantities in connection with special Government work, and they have been receiving special attention. The largest manufacturer's order going through has a capacity of 8,000,000 gallons per twenty-four hours.

* * * *

United Water Softeners, Limited, of Imperial House, Kingsway, the well-known makers of water purification and softening plant, have, during the past year, been almost exclusively occupied in the supply of these plants for Government purposes and use in munition factories. A large number of their plants are in use on the various Fronts, and their specialities have been prominently to the fore in the equipment of the large national factories erected in this and allied countries.

The firm have considerably developed their business in water filters, and are now supplying a very compact and powerful type of improved filter suitable for use in the purification of public and private water supplies, works' effluents, &c.

The war has brought the question of water sterilisation into the forefront of water purification problems, and United Water Softeners, Limited, have developed several important processes for the rapid and effectual sterilisation of contaminated or suspected water supplies.

We referred in a recent issue to the increasing attention now being paid to the use of chlorine gas in water sterilisation in the United States, and the success which has attended its use in many large installations, notably those of New York City, Newhaven, Conn., New Brunswick, and New Brighton. The prohibitive price of hypochlorite has given an immense impetus to the adoption of direct chlorination, and many hundreds of such plants are now at work in the States. Messrs. United Water Softeners have secured the sole British rights in a unique chlorine control apparatus, at last, it is claimed, solving the problem which has hitherto barred the way to the universal adoption of direct chlorine treatment in preference to indirect methods—viz., the difficulty of controlling the dose. The new apparatus is exceedingly simple and compact, and the working costs are stated to be below [illegible] hypochlorite method.

* * * *

The filter plant which the "Turn-over" Filter Company, 39 Chichester-street, Belfast, installed towards the latter end of 1914 for the Morley Corporation Waterworks has now been at work about sixteen months, and the period of guarantee expired last October. The engineer appointed to make the bacteriological and chemical examination on the water stated that "all the conditions of the contract were completely fulfilled," and in other respects the working of the filters has given complete satisfaction.

As regards the firm's special plant for filtration of water in swimming baths, only one installation was completed last year, as in this line expenditure has, of course, completely stopped. This was an installation for the new baths built by the Motherwell Corporation. For a district in which there are a very large number of munition workers, and the attendance at the baths has been very large. During the opening weeks the attendance amounted to approximately 5,000 bathers per week and for several months to an average of 3,000 per week. In spite of this large attendance, the water has been kept in satisfactory condition, and the last report received stated that it was perfect in every way. On the strength of such reports as these, the system should be popular when the war is over.

* * * *

The Ransome-verMehr Machinery Company, Ltd., Brunswick House, Westminster, have been exceedingly busy during the past twelve months on the manufacture of their Ransome drifting-sand filters for the British War Office, these filters being destined for purifying water for the troops of the Expeditionary Forces. They have also supplied these filters to the French and Rumanian Governments.

In addition, it may be mentioned that the first units of the large purification plant that the firm are installing for the city of Toronto (60,000,000 gallons of water per day) have been successfully operating for the past three months. Further, they have in hand an order for filters for the Brazilian Government for treating 4,500,000 gallons of water per day.

* * * *

The Pulsometer Engineering Company, Limited, of London and Reading, have not carried out any large contracts for a waterworks plant during the past twelve months, but they have supplied several of their turbine pumps as auxiliaries to the main waterworks plant for the purpose of supplying an additional quantity of water to places where military camps have been built, or where the demand has increased owing to increase in population due to the erection of munition factories.

For obvious reasons it is not advisable to mention the localities where these pumps have been fixed. The pumps have all been of the company's standard make, direct-coupled to electric motors or high-speed petrol engines. When the pumps have been put down for the purpose of supplying camps they have generally been arranged to deliver into a new main, but in villages and small towns, where the demand has increased owing to increase in population, the extra quantity has been obtained by fitting turbine pumps to act as boosters—that is, to increase the pressure in the existing mains so as to enable a greater quantity of water to be forced through the mains into the particular district.

This is a very useful application of the turbine pump, as it can be placed in small houses or underground chambers, so that the cost of the installation is very small, and as the Pulsometer Company's turbine pumps are very efficient, the running costs are comparatively light. These pumps require very little attention, as they will run for weeks without any lubrication, and as the maximum pressure can never be exceeded there is no risk of causing an excessive pressure on the mains.

* * * *

The water purification department of Messrs. Mather & Platt, Limited, London and Manchester, has during the past year been busily employed in the construction of mechanical filters for H.M. factories and other war purposes, some of which have been exceptionally large contracts. The restrictions imposed by the Government on all classes of engineering manufactures, and also the curtailment of loans by the Local Government Board, have naturally had a large influence in causing a dearth in public water supply installations at home. Nevertheless, Messrs. Mather & Platt have been able to execute another order for the Sheffield Corporation, which completes the Rivelin installation of twenty-four filters, dealing with a total of 4,500,000 gallons per day. They have also several other contracts in hand for public water supplies abroad, including Japan, India, Malay States and Egypt.

* * * *

The Candy Filter Company, Limited, 5 Westminster Palace Gardens, S.W., have been engaged during the past year supplying their well-known mechanical filter plants to various municipalities, as well as Government establishments, camps, munitions and explosive factories, &c. A large installation recently completed comprises chemical plant and mechanical filters for dealing with the whole of the water supply of Falmouth, and a further repeat order has just been placed with the company for an extension of the plant to meet the increasing demand for filtered water at this favourite Cornish Riviera health resort, which, in adopting Candy filters, has followed the example of such well-known watering-places as St. Leonards-on-Sea; Hythe, Kent; Hastings, Paignton, Harrogate; Cowes, Isle of Wight, and Torquay.

The Candy "Deolor" filter system continues to be extensively adopted by authorities who have to deal with bacteriologically suspicious water supplies, in-

stallations having been laid down at some of the most important military stations in the country. The "Declor" system, it is claimed, ensures, by the use of chlorine, the absolute destruction of the B. coli, cholera vibrio, and typhoid bacillus, and also afterwards removes from the water any excess of free chlorine, so that the purified water is not only absolutely safe and pure, but also palatable and quite free from the unpleasant odour and taste often found in waters that have been treated with chlorine without the "Declor" system.

A large municipality in South Africa, which has used Candy Filters for the past six years, has just sent a repeat order for more filters.

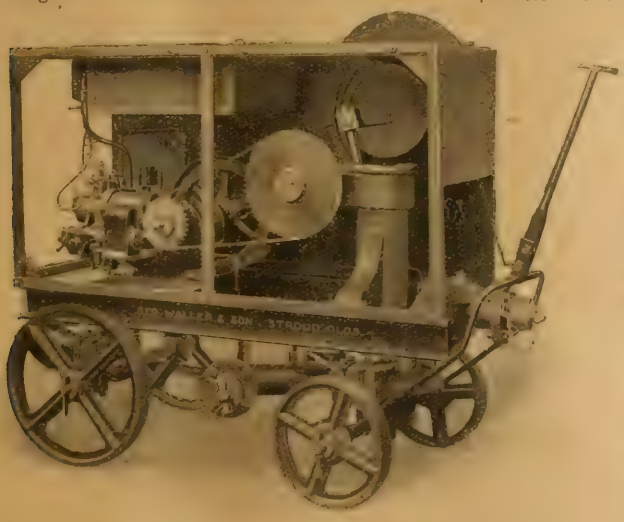
Several installations of Candy iron removing filters have been laid down, and although many filtration plants for municipalities are being held over until the end of the war, the large number of Candy filter plants required for Government use and for abroad have kept the company very busy during the past twelve months.

CESSPOOL EMPTYING.

POWER-DRIVEN PORTABLE PUMPS.

In addition to the emptying of cesspools, the apparatus illustrated herewith will be found useful for council purposes in a variety of ways, for they will pump water, empty sludge tanks, or trenches, and a pulley can be fitted to the engine, and arrangements made for easily disconnecting the pump, so that the set can be taken to different depots. It is always ready for any sort of work, and is a real labour saver.

The pump is of special design for dealing with thick sludge, having large area valves of the hinged flap type with rubber faces, and a detachable cover is provided over each valve, so that these are easily accessible. The plunger is 5-in. diameter, 8-in. stroke, leather packed, with forged steel rod, and crankshaft, with substantial gun-metal bearings.



WALLER'S POWER-DRIVEN PORTABLE SLUDGE PUMP.

The engine is of a high-class expert design, having electric magneto ignition for running on petrol, and will develop full load at the moderate speed of 400 revolutions per minute. The cooling water flows to the cylinder jacket by gravity, thus avoiding the circulating pump, which is a feature of some other types of portable engines. High-class anti-friction metal bearings are fitted, and with proper adjustment of lubrication these engines will run continuously over very long periods without attention.

The power from the engine is transmitted through Renolds' chain and machine-cut gears, forming a reliable drive.

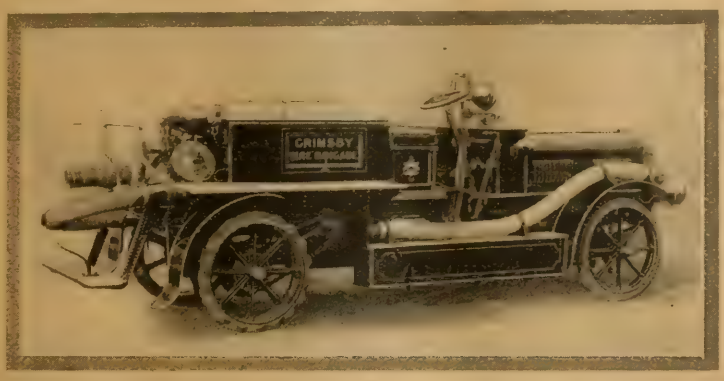
The set is mounted upon a steel under-frame, having four wheels with steel axles, springs swivelling fore carriage, and forged draw handle. The machinery is totally enclosed in a neat steel-plate cover, built upon an angle iron frame with large detachable doors, so that easy access is given for cleaning down, oiling, &c. The petrol reservoir and circulating water tank are carried over the engine inside the casing with screwed plugs, for filling from outside, so that this can be done while engine is working, if necessary.

The engine can be readily started, and the set could be run by a youth.

The whole is made by Messrs. George Waller & Son, at the Phœnix Ironworks, Stroud, Gloucestershire, and prospective clients are invited to inspect these sets in course of manufacture and under test.

MOTOR FIRE ENGINES.

During the year 1916 Messrs. Merryweather & Sons, the well-known fire engineers, of Greenwich-road, London, S.E., supplied a number of their "Hatfield" motor fire engines to various Government Departments, including the Admiralty, War Office, Ministry of Munitions, India Office, and Crown Agents for the Colonies. Being extremely busy on war work of an urgent character, their output of vehicles for municipal requirements did not reach anything like its normal level, but "Hatfield" engines were supplied to Edinburgh, Rochester and Grimsby, these orders going through under a priority certificate. The well-known firm of Messrs. Brunner, Mond & Co., Northwich, also received delivery of a second engine of this design, and orders were received from Leeds, Margate, Hoylake and West Kirby, Ripon, Selby, &c.



"HATFIELD" MOTOR FIRE ENGINE SUPPLIED TO GRIMSBY.

The accompanying illustration shows the "Hatfield" motor fire engine supplied to Grimsby, this being the second of its type for the well-known East Coast port, and the fourth Merryweather motor machine to be placed in commission there. It has a pumping capacity of 400 gallons per minute, and is mounted on steel wheels, the rear wheels being fitted with cross-ribbed pattern solid rubber tyres.

Water Purification and Softening.—At a meeting of the Institution of Civil Engineers of Ireland to be held in Dublin on February 5th, a paper entitled "Recent Practice in the Purification and Softening of Public Water Supplies" will be read by Mr. Fred. C. Uren, M.INST.C.E.I., engineer and surveyor to the Aldershot Urban District Council. The chair will be taken at 8 p.m.

Literature of Municipal Engineering in 1916.

[Any book included in this summary will be forwarded, post free, on application to the St. Bride's Press, Limited, 24 Bride Lane, Fleet Street, London, E.C. The published price must be enclosed.]

In accordance with our usual custom, we publish below a summary of the books dealing with subjects of interest to municipal engineers which have been issued during the past year. In doing so we may, perhaps, direct the attention of our readers to THE SURVEYOR Book Department, through which technical books, issued by various publishers, may be obtained from a single source with the minimum amount of trouble. Orders by post receive careful and prompt attention, and particulars and lists of books on any desired subject may be obtained on application. The references in parentheses are to the volume and page of THE SURVEYOR in which a review has appeared.

Annuals and Year-books.

"Gas Works Directory and Statistics, 1915-16." Price 10s. 6d. nett. London: Hazell, Watson & Viney, Limited. (Vol. 49, p. 264.)

"Hazell's Annual, 1916." Price 3s. 6d. nett. London: Hazell, Watson & Viney. (Vol. 49, p. 234.)

"The Empire Directory of Municipal Authorities and Officials and Year-book." Price 5s. nett. London: The Sanitary Publishing Company, Limited. (Vol. 49, p. 302.)

"Willing's Press Guide, 1916." Price 1s. London: James Willing, Limited. (Vol. 49, p. 334.)

Architecture and Building.

"Architectural Building Construction." Vol. I. By W. R. Jaggard, F.R.I.B.A., and F. E. Drury. Price 6s. nett. Cambridge: The University Press. (Vol. 50, p. 509.)

"Laxton's Builders' Price-book for 1916." Price 4s. London: Kelly's Directories, Limited. (Vol. 49, p. 280.)

"Lockwood's Builders' and Contractors' Price-book." Price 4s. London: Crosby Lockwood & Son. Vol. 49, p. 234.)

"Spon's Architects' and Builders' Pocket Price-book." Price 2s. 6d. nett. London: E. & F. N. Spon, Limited. (Vol. 49, p. 179.)

"The Orders of Architecture." By A. B. Greenberg. Price 2s. 6d. nett. New York: John Wiley & Sons, Inc. London: Chapman & Hall, Limited. (Vol. 50, p. 561.)

Applied Mathematics.

"Applied Mechanics for Engineers." By C. B. Clapham, B.SC.ENG. Price 5s. 6d. nett. London: Chapman & Hall, Limited. (Vol. 50, p. 509.)

"Graphics and Structural Design." By H. D. Hess, M.E. Second edition. Price 12s. 6d. nett. New York: John Wiley & Sons, Inc. London: Chapman & Hall, Limited. (Vol. 49, p. 615.)

"Mathematics for Machinists." By R. W. Burnham, M.A. Price 5s. 6d. nett. New York: John Wiley & Sons, Inc. London: Chapman & Hall, Limited. (Vol. 49, p. 264.)

Electricity.

"Large Electric Power Stations: Their Design and Construction." By Dr. G. Klingenberg. Price 25s. nett. London: Crosby Lockwood & Son. (Vol. 50, p. 204.)

Highways.

"Elements of Highway Engineering." By Arthur H. Blanchard. Price 12s. 6d. nett. New York: John Wiley & Sons. London: Chapman & Hall, Limited. (Vol. 49, p. 364.)

"Practical Roadwork." By H. T. Wakeham, M.INST.C.E. Price 1s. 6d. nett. London: Wyman & Sons, Limited. (Vol. 49, p. 472.)

"The Construction of Roads and Pavements." By T. E. Ingle, Professor of Highway Engineering, Leeds School of Engineering. Price 12s. 6d. nett. London: Hill Publishing Company, Limited. (Vol. 50, p. 481.)

"The Testing of Lime and Plaster for Ready Use: A Practical Guide for Engineers and Surveyors." Price 1s. nett. Ewing Hamilton & Co., 11 Todd Street, Westminster. (Vol. 49, p. 627.)

Hygiene, Public Health and Sanitation.

"Elementary Sanitary Engineering." By G. Bransby Williams, M.INST.C.E. Price Rs.5. Calcutta: Thacker, Spink & Co. (Vol. 50, p. 509.)

Sewerage and Sewage Disposal.

"Sewerage. The Designing, Construction and Maintenance of Sewerage Systems." By Prof. A. P. Folwell. (Seventh Edition.) Price 12s. 6d. nett. London: Chapman & Hall, Limited. (Vol. 49, p. 560.)

"The Operation of Sewage Disposal Plants." A manual for the practical management of sewage disposal works, with suggestions as to improvements in design and construction. By Francis E. Daniels, director of water and sewerage inspection, Board of Health of the State of New Jersey. Price $·50. Published by *Municipal Journal*, New York, U.S.A. (Vol. 50, p. 169.)

Structural Engineering.

"Bridge Foundations." By W. Burnside, ASSOC.M. INST.C.E. Price 4s. nett. London: Scott, Greenwood & Son. (Vol. 49, p. 264.)

"Elements of Railroad Track and Construction." 2nd Edition. By W. L. Wilson. Price 10s. 6d. nett. New York: John Wiley & Sons, Inc. London: Chapman & Hall, Limited. (Vol. 49, p. 390.)

"Field Engineering" (17th Edition). By W. H. Seales, C.E. Price 12s. 6d. nett. New York: John Wiley & Sons, Inc. London: Chapman & Hall, Limited. (Vol. 49, p. 334.)

"The Stability of Arches." By Ernest H. Sprague, ASSOC.M.INST.C.E. Price 4s. nett. London: Scott, Greenwood & Son. (Vol. 50, p. 561.)

Steam and Mechanical Engineering.

"Elements of Heat-power Engineering." By C. F. Hirshfield, M.M.E., and W. N. Barnard, M.E. Price 21s. nett. New York: John Wiley & Sons, Inc. London: Chapman & Hall, Limited. (Vol. 49, p. 302.)

"Machine Design." By A. W. Smith and G. H. Marx. 4th Edition. Price 12s. 6d. nett. New York: John Wiley & Sons, Inc. London: Chapman & Hall, Limited. (Vol. 50, p. 169.)

"Properties of Steam and Ammonia." By G. A. Goodenough, M.E. Price 5s. 6d. nett. New York: John Wiley & Sons, Inc. London: Chapman & Hall, Limited. (Vol. 49, p. 20.)

"Steam Boiler Economy." By W. Kent, M.E. 2nd Edition. Price 19s. nett. New York: John Wiley & Sons, Inc. London: Chapman & Hall, Limited. (Vol. 49, p. 615.)

"The Mechanical Handling and Storing of Material." By G. F. Limmer, ASSOC.M.INST.C.E. Price 42s. nett. London: Crosby Lockwood & Son. (Vol. 50, p. 169.)

"Valves and Valve Gears: Vol. II., Gasolene, Gas and Oil Engines." By F. D. Furman, M.E. New York: John Wiley & Sons, Inc. London: Chapman & Hall, Limited. (Vol. 49, p. 390.)

Surveying.

"Geodetic Surveying." By E. R. Cary. Price 10s. 6d. nett. New York: John Wiley & Sons, Inc. London: Chapman & Hall, Limited. (Vol. 50, p. 481.)

"Tacheometer Surveying." By M. E. Yorke Eliot, ASSOC.M.INST.C.E. Price 5s. nett. London: E. & F. N. Spon. (Vol. 49, p. 121.)

Town Planning and Housing.

"The Housing of the Working Classes Acts, 1890-1909, and the Housing Acts, 1914, Annotated and Explained." 4th Edition. By C. E. Allan, M.A., LL.B., barrister-at-law, assisted as to the practice by F. J. Allan, M.D., D.P.H., medical officer of health to the City of Westminster. Price 12s. 6d. nett. London: Butterworth & Co., and Shaw & Sons. (Vol. 49, p. 434.)

"The Planning of the Modern City." By Nelson P

Lewis. Price $3.50 nett. New York: John Wiley & Sons. (Vol. 50, p. 111.)

"The Welsh Housing Year-book." Edited by Edgar L. Chappell. Price 1s. nett. Cardiff: The South Wales Garden Cities and Town Planning Association. (Vol. 49, p. 49.)

Valuation.

"Value for Rate-making." By H. Floy. Price 17s. nett. New York and London: The M'Graw-Hill Book Company, Inc. (Vol. 50, p. 481.)

Water Supply and Hydraulics.

"Hydraulic Flow Reviewed." By Alfred A. Barnes, A.C.G.I., ASSOC.M.INST.C.E. London: E. & F. N. Spon, Limited. (Vol. 49, p. 319.)

"Transactions of the Institution of Water Engineers, 1915" (Vol. xx.). London: The St. Bride's Press, Limited. (Vol. 50, p. 509.)

"Waterworks Handbook." By Alfred Douglas Flinn, Robert Spurr Weston, and Clinton Lathrop Bogert. 1st Edition. Three hundred and eleven tables and 411 illustrations. Price $6. New York: M'Graw-Hill Book Company. (Vol. 50, p. 269.)

Pocket-books.

"The American Civil Engineers' Pocket-book." Edited by Mansfield Merriman and others. Price 21s. nett. New York: John Wiley & Sons, Inc. London: Chapman & Hall, Limited. (Vol. 50, p. 561.)

"The Architects' and Builders' Pocket-book." By the late Frank E. Kidder, T. Nolan, editor-in-chief. 16th Edition. Price 21s. nett. New York: John Wiley & Sons, Inc. London: Chapman & Hall, Limited. (Vol. 50, p. 394.)

"The *Mechanical World* Electrical Pocket-book for 1916." Price 6d. nett. Manchester: Emmott & Co., Limited. (Vol. 49, p. 214.)

"The *Mechanical World* Pocket-diary and Year-book for 1916." Price 6d. nett. Manchester: Emmott & Co., Limited. (Vol. 49, p. 214.)

Miscellaneous.

"A Student's Book on Soils and Manures." By E. J. Russell, D.SC. Price 3s. 6d. nett. Cambridge University Press. (Vol. 49, p. 264.)

"Construction, Equipment and Management of a General Hospital." By D. J. Macintosh, M.V.O., M.B., LL.D., F.R.S.E. Price 15s. nett. Edinburgh and London: W. Hodge & Co. (Vol. 50, p. 561.)

"Determinative Mineralogy." By J. V. Lewis. Price 6s. 6d. nett. New York: John Wiley & Sons, Inc. London: Chapman & Hall, Limited. (Vol. 49, p. 234.)

"Directory of British Manufacturers for Russian Trade." Edited by R. A. Lenski. (Vol. 49, p. 214.)

"Clays and Clay Products." By A. B. Searle. Price 1s. 6d. nett. London: Sir Isaac Pitman & Sons. Limited. (Vol. 49, p. 264.)

"Manuring for Higher Crop Production." By E. J. Russell, D.SC. Price 3s. nett. Cambridge University Press. (Vol. 50, p. 561.)

"The Civil Engineer's Cost-book." By Lieut.-Colonel T. E. Coleman, R.E. Staff. Price 6s. nett. London: E. & F. N. Spon. (Vol. 49, p. 121.)

"The Railway Swindle." By Henry Murray. Price 2s. 6d. nett. London: Grant Richards, Limited. (Vol. 50, p. 509.)

"The Tithe Rentcharge Table for 1916." By P. W. Millard, LL.B. Price 1s. London: Shaw & Sons. (Vol. 49, p. 264.)

House Refuse Removal at Newcastle-on-Tyne.—In view of the shortage of labour, and with a view to securing the consumption in dwelling-houses of materials deposited in dustbins having a value for fuel, the Newcastle-on-Tyne Improvement and Streets Committee have given notice that, as from February 1st next, corporation employees engaged in removal of house refuse will have instructions to remove from dustbins and ashpits, and to leave on the premises of householders for consumption as fuel cinders, small coal, and other combustible material which ought to be burned. All householders are earnestly enjoined in the interests of public health to burn all vegetable and animal refuse, and not to deposit it in dustbins and ashpits, and further to refrain from depositing therein any wet refuse calculated to set up fermentation.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Is it a fact that both the Manchester and the Salford Corporations have declined to employ women sweepers for street work, notwithstanding that an important deputation of ratepayers desired them to do so? What is the reason for this refusal? Is it because these corporations are under the impression that their streets are models of cleanness, or that they have sufficient male labour for the purpose?

* * * *

Is it not satisfactory to hear that the town council of Aberdeen have at last decided as to the source of their proposed new water supply, and that, thanks to the researches of Dr. Houston, they will be able to make use of the waters of the river Dee for this purpose? Is it not rather remarkable that the recent introduction of "chemicals" for the sterilisation of water has so wonderfully revolutionised water purification, whereas for sewage purification chemical treatment, for this purpose, has practically been abandoned?

* * * *

Shall we obtain our future supplies of nitrogen from sewage, as suggested by Dr. S. Rideal, or from the atmosphere, as promised by an American engineer, whose name has not yet been divulged? Are we not more likely to be influenced by Dr. Rideal in his suggestion than by this engineer, whose pronouncements savour of "wonder-mongering"?

* * * *

Why does the Canadian town planning engineer appear to shirk curved streets and roads in his designs? Is it because the streets of nearly all American and Canadian towns are laid out in monotonous straight lines, crossing each other at right angles? Is it because of a supposed difficulty in constructing the sewers, or is it because of the real difficulty in measuring and laying out the building plots?

* * * *

What is going to be done about the serious earth slides which are constantly taking place on the Panama Canal? If, as is stated, the engineers have tried, without avail, colossal schemes of drainage, asphalting the surface of thousands of acres of land to prevent infiltration of rain, the erection of huge retaining walls, and other works to prevent these slides, what is left for them to do except to dredge and dredge, and dredge, at an exceedingly heavy annual cost?

* * * *

Is it a fact that the transport of some of our munitions and heavy ordnance is being seriously hampered by the rickety condition of many of the bridges over our derelict canals? Does it not seem a grievous absurdity that, owing to legal quibbles as to what body is responsible for their repair, the transport of military and civil goods should be thus hampered? Who will deliver us from this mighty burden of legal entanglements with which we are surrounded?

* * * *

Will it not be a long time before the Englishman gives up his cherished open fireplace and cheerful coal fire, and substitute the tame, unattractive, gas fire? Does not the grate and fireplace, with its chimney-piece, give also the designing architect a chance to improve the appearance of a room, and is it possible to do this when a gas fire is substituted? Has anybody yet clearly demonstrated what is the real monetary saving effected by substituting gas fires for coal fires, except for cooking purposes?

* * * *

Are elaborate experiments on earth pressures of much practical value? Is it not more important to be able to ascertain quite correctly what is exactly the nature of the soil, or formation, on which the foundations of a heavy structure will rest? Have there not been a large number of cases in the courts arising out of the difficulties of correctly ascertaining this, and if some more reliable and economical method than that of boring, or shaft sinking, could be introduced, would it not be of more value than mere academic experiments on earth pressures?

Law Notes.

EDITED BY J. B. REIGNIER CONDER, Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries which should be written legibly on foolscap paper, on one side only, should be addressed to "The Law Editor," at the office of THE SURVEYOR, accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary copies of local Acts or documents referred to should be enclosed. **All explanatory diagrams must be drawn and lettered in BLACK ink only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment.** *Unless these conditions are complied with we cannot undertake to reply to queries.*

QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words as noms de plume. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

EXTRAORDINARY TRAFFIC.—"P. D. North" writes: Extraordinary traffic is being carried out in various parts of the district, and additional expenses are being incurred thereby. The traffic consists of the removal of timber by means of steam traction. Will you kindly furnish in your valuable paper a [illegible] form of Certificate of Surveyor with respect to such expenses, also general particulars as to how the accounts should be kept by local authorities?

Two forms of certificate are given in the Appendix to "The Law of Extraordinary Traffic on Highways," by Rayward Lalley, published by Sweet & Maxwell, Limited, 3 Chancery-lane. They are too lengthy to be set out here, but the following is an outline form suggested by a comparison of the two:

In the matter of the Highways and Locomotives Amendment Act, 1878, and the Locomotives Act, 1898.

To the [ ] District Council, being the highway authority which is liable to repair the highway leading from [ ] to [ ].

I, the undersigned, surveyor of the above-named highway authority, hereby report and certify that, having regard to the average expense of repairing highways in the neighbourhood, extraordinary expenses have been incurred by the said authority during the year ending ———, 19——, in repairing the said highway (which is about [ ] in length) by reason of the damage caused by excessive weights passing along the same, and extraordinary traffic thereon, namely:—

[Here set out the nature of the traffic in detail.]

The cost per mile of repairing the said highway during the said year was £[ ]. The cost of repairing all other highways of the like class, repairable by the said highway authority during the same period, was £[ ] per mile, and the average cost of repairing those highways and the highway in question during the preceding [ ] years was £[ ] per mile. In my judgment there was nothing but the damage caused by the said weight and traffic by which the increase above referred to in the cost of repairing the said highway can be reasonably accounted for.

Dated this ——— day of ———, 19——.

(Signed) ———,

Surveyor of the above-named [ ] Council.

In the above work (p. 69) it is suggested that a separate account should be kept of each road, breaking up long roads into two or more sections, and that the account books should enable the cost, during each year, of materials, cartage, labour, steam rolling, &c., on any given length of road, to be readily arrived at.

THE ADOPTION OF PRIVATE STREETS.—"A. P. S." writes: About ten years ago an estate owner laid out and formed a road on his estate. Buildings were erected on both sides of the road, and about six years ago an arrangement was come to between the estate owner and the urban district council that the road should be made up by the frontagers and kept in repair by them for six months, at the end of which period it was to be taken over by the council as a highway repairable by the inhabitants at large. The road was accordingly made up and kept in repair for six months by the frontagers. It has never been formally taken over by the council, however, and has now become greatly out of repair. The Private Street Works Act, 1892, has been adopted in the district. I should be greatly obliged if you would inform me, through the medium of THE SURVEYOR, whether the road has become a "highway repairable by the inhabitants at large," or whether it is now open to the council to make it up at the expense of the frontagers under the Act?

This depends upon whether the arrangement with the estate owner was [illegible] in effect, to a binding agreement by the council to take over the road, under sec. 146 of the Public Health Act, 1875. I think it is highly probable that the Court would hold that the frontagers having carried out their part of the arrangement, it was and is, binding on the council that the road is a highway repairable by the inhabitants at large. See *Bromley Local Board v. Tomlin*, 71 J.P., 1; December 5, 1891. *Folkestone Corporation v. Martin*, 76 J.P., 153.

HIGHWAY PUBLIC FOOTPATH SUBSIDENCE REPAIR.—"Perplexities" writes: There is a public footpath in this parish, which forms a short cut between two roads. The path skirts a hedge dividing two fields forming part of a large farm, and there is a natural stream or watercourse running alongside it. Owing, as is supposed, to the undermining action of this stream, aggravated by heavy floods, a large portion of the path has subsided to a considerable depth, and is practically impassable. The cost of reinstating the path at its original level would be very heavy. I shall be very grateful if you will let me have your opinion on the following points: (1) Is the rural district council, as highway authority, bound to raise the footpath to its original level, or what is the extent of their liability? (2) Is the owner of the land under any, and (if any) what liability? (3) Have the public a right to deviate along the other side of the hedge while the path is impassable?

(1) Unless the path has been completely destroyed the council are bound, in my opinion, to do what is necessary to render it as commodious to the public as it was before the subsidence took place, if repairs are reasonably practical. But they are not necessarily bound to restore it to its original level if it can be made equally commodious without doing so. If, however, it has been completely destroyed, and having regard to its position, and the propinquity of the stream, repairs must, in the nature of things, always be ineffectual, the liability to repair it would, in my opinion, be extinguished. See *Rex v. Landulph* (1 Moo. and R., 366). (2) No, I think not. (3) No, unless there is also a public right of way along that side.

PRIVATE STREET WORKS: APPORTIONMENT.—"Access" writes: In this (urban) district the council have decided to make up a certain private street under the Private Street Works Act, 1892 (which has been adopted). About mid-way between the two ends of the street there is a private road joining it at right angles, which is in process of formation. There are a few houses abutting on this road, at the end next the street to be made up, and which houses will undoubtedly be benefited by the proposed works. I shall be obliged if you will inform me, through the columns of your valuable paper, whether, in your opinion, these houses can legally be included in the apportionment.

Under sec. 10 of this Act the council may, if they think just, include in the apportionment any premises access to which is obtained from the street "through a court, passage, or otherwise," and which, in their opinion, will be benefited by the works. In my opinion, if the private road is being formed solely for the purpose of giving access to the houses abutting on it from the street which is to be made up, the houses can be included in the apportionment. But if, on the other hand, the road is in process of development as a public street, the section would not apply, and the houses could not be included. See *Newquay Urban District Council v. Riskeard and Another* (1911, 2 K.B., 846).

EXTRAORDINARY TRAFFIC.—"Cambria" writes: A colliery company in this district were in the habit for many years of carting coal along a by-lane, about ¼ mile in length, to a railway station. The carting was done by means of horse-drawn wagons, travelling singly or in pairs. About two years ago they discontinued the use of horse-drawn vehicles, and substituted large trucks, drawn by heavy traction engines, which have cut up the lane very badly, necessitating heavy increased expenditure in its repair. Will you oblige me by stating whether, in your opinion, the highway authority can legally claim payment of extraordinary traffic expenses from the company? There was no other heavy motor traffic on the lane during the two years.

In my opinion the highway authority are legally entitled to recover from the company the additional expenses incurred in repairing the lane by reason of damage done by the traffic in question within twelve months before the commencement of proceedings. In order to enable them successfully to maintain their claim, however, it will be necessary for their surveyor to give a certificate, stating that, having regard to the average expense of repairing highways in the neighbourhood, extraordinary expenses have been incurred by the authority in repairing the lane by reason of damage caused by the traffic referred to. The certificate should set out all the facts in detail. It is a necessary preliminary to the proceedings, and should be very carefully prepared.

FOOTPATH CROSSING STREAM: FLOODING. "E. M." writes: An old public footpath crosses a stream, and an earthenware pipe has been laid to convey the water under the path. In times of heavy rain the water flows

over the path, owing to the stream becoming silted up and (or) the pipes being too small. The owner of land higher up the stream has suffered damage by flooding. Will you please say if the owners or occupiers of land abutting the stream are liable to cleanse the silt from the bed of the stream and put in a larger pipe under the path, also for damage caused to the owner of land flooded, and for damage to the path, or are the council liable?

In order to express a decided opinion as to this, it would be necessary to know by whom, when, and under what circumstances the pipe was laid under the footpath, and whether the floods are due to its interfering with the natural flow of the stream. Upon the bare facts stated in the query, I think it is very doubtful whether either the owners or occupiers or the council are liable.

Birmingham Town-planning Schemes.—An amending scheme for a portion, 247 acres in extent, of the East Birmingham area (1,443 acres) has been drafted and submitted for the approval of the Local Government Board. A revision of the draft map and scheme of the North Yardley area (3,176 acres), which embodies an area within the Meriden Rural District, is in preparation, and it is hoped very shortly to be able to submit the final scheme to the board. The tentative proposals of the committee with reference to the South Birmingham scheme (8,400 acres) have been submitted to all owners concerned and interested, and the draft scheme map and ownership map are nearing completion for early submission to the board. A reference of ownerships and revision of the Ordnance Survey of the South-West Birmingham area (9,200 acres) is well in hand, in view of an early application to the board for permission to prepare a scheme. The future improvement of the arterial roads and other main thoroughfares of the inner area of the city, and a possible remodelling of these with a view to their ultimate reconstruction, together with the consideration of all kinds of traffic facilities, will receive consideration during the year.

PIGSTIES: THEIR ERECTION AND CONTROL.

To the Editor of THE SURVEYOR.

SIR,—An article in THE SURVEYOR on "Pigsties" would at the present moment not only be interesting but useful.

"We must relax our by-laws with respect to pigsties," said my chairman over the 'phone, and he was considerably surprised that the word "pigsties" could not be found in those by-laws. Some sets certainly do deal with nuisances caused by the keeping of swine.

If a pigsty be a "domestic building" within the meaning of the by-laws, the question of "site" and "sufficiency of air space" would appear to be involved.

Unless proper drainage can be provided, the question of "cesspools" arise. By-laws usually require them to be placed 50 ft. to 75 ft. from dwelling-houses, well, &c.; their method of construction is definitely set out—a wicked waste of good material where a piped water supply exists.

"There is no prohibition in law as to pigsties," we read.

"The keeping of swine in a city is a nuisance at common law."

"In urban districts by-laws may be made regulating pigkeeping."

"Rural authorities, even though armed with urban powers, (?) may not attempt the regulation, generally, of pigkeeping."

"A by-law prohibiting the keeping of swine in a rural district was held to be unreasonable and bad."

Sec. 91 (3) of the Public Health Act of 1875, says: "Any animal so kept as to be a nuisance *or* injurious to health" shall be deemed to be a nuisance, liable to be dealt with in manner provided by the Act." Sec. 47 prohibits the keeping of swine *in* any dwelling-house within an urban district, but there appears to be no such restriction with respect to a rural district. The fact remains, however, that no person has any legal right to commit a nuisance, and if he does commit or permit one, he can be punished.

In order efficiently to control the erection of pigsties, plans should be demanded, otherwise they will occasionally be erected under a neighbour's bedroom window, or actually abutting on the highway, on ground the configuration of which is such as must permit an overflowing cesspool to cause a nuisance. They might be classed as "temporary buildings," thus permitting their construction of wood. An impermeable floor of hard brick or concrete, and a small watertight cesspool, should be a minimum requirement.

The Board of Agriculture leaflet, No. 121, contains many useful hints, and No. 298 gives a plan.

Better not build at all than face them north or east.

Pigs do not thrive unless you can keep them warm.

They should not be in pairs; the warm corner should in every case back north and east.

A few headers left out of the wall during construction gives ample ventilation, and a handful of straw stuffed in the holes during bad weather prevents draughts.

Three feet is not high enough for the walls—they should be 3 ft. 6 in. to 4 ft.

Troughs should be accesible from the outside; but, when a split drain-pipe, set in concrete, makes the best type, why purchase fireclay?

Why the extra cost of brick on edge, when even 1-in. thick quarries, of wastrel quality, make an excellent floor?

If concrete is used, herring-bone it with grooves to assist drainage.

Two inches fall in 7 ft. I would double it.

Keep the floor well above outside ground level. I prefer a 3-in. step-up into the bed, and a few old boards for a mattress—a well-behaved pig seldom fouls the bed.

A bit of spouting, if only of wood, along the eaves of a lean-to roof prevents half the rain-water from entering the cesspool.

The rail for the breeding-sow may be provided for by leaving out headers at each corner; through the holes a wooden rail can be inserted and withdrawn.

For a cesspool, obtain an old iron drum or a defective 12-in. or 15-in. sanitary pipe, set on a 3-in. bed of

concrete, with a similar band round the outside, socket up, wooden lid roughly fitted. The frost will crack the pipe, the iron drum will soon rot away, but the concrete is practically everlasting.

Much more might be said. All sounds very exacting, but it all tends to simplicity, cheapness and efficiency.—Yours, &c.,

T. H. NEGUS,
District Surveyor, Meriden R.D.C.

Coleshill.
Birmingham.

SURVEYORS AND COTTAGE DESIGN.

To the Editor of THE SURVEYOR.

SIR,—Your correspondent, "Local Surveyor," in your issue of the 12th inst., accuses me of having made a most unjust attack upon the general body of surveyors and local authorities in stating in a recent lecture that the surveyor to a local authority is not qualified to undertake the design of cottages.

Should I be elevating the architectural profession if I said that its members found the practice of architecture so easy of attainment that they were also able to undertake road construction, and the design and superintendence of all the works attendant upon the laying of a big sewer? To do so would mean that I attached more importance to the opinion of a jack-of-all-trades on a specialised question than to the opinion of an expert.

I see no reason for detracting from what I have said, and this in view of the very high opinion I have of the professional qualifications of the surveyor.

The practice of cottage building, viewed from its constructive, economic and artistic aspects, is one that demands a special training, and thus the training of an architect; and to the surveyor, versatile as his peculiar office tends to make him, work demanding a knowledge of the details of architecture must necessarily be more or less obscure.

No doubt there are a few surveyors, and your correspondent may be one of them, who are better architects than surveyors; there are certainly architects who have mistaken their calling. Exceptions and misnomers occur everywhere.

But we must remember that, while the general education of members of all the professions will in the future need to be broadened and improved, superimposed upon a good general education, the professional practitioner will, if he is to attain that proficiency in his profession which the future will demand of him, need to specialise more.

The surveyor to a local authority (would that he always knew it!) may claim to belong to perhaps the most important of the technical professions; to be an expert in the provision of all the services of a municipality, and on subjects varying from the laying down of a comprehensive town plan to questions relating to the effect of varying atmospheric conditions on road crusts, to say nothing of the business qualifications, tact and diplomacy that are so necessary in the realisation of schemes. To hold such qualifications and use them successfully is surely sufficiently difficult, without adding architecture and poaching upon other professional preserves.—Yours, &c.,

S. D. ADSHEAD.

46 Great Russell-street, W.C.
January 17, 1917.

Bristol Road-tarring Costs.—The city engineer, Mr. L. S. McKenzie, reports that the total area of roads in Bristol treated with tar last season amounted to 1,510,777 super. yds., as compared with 1,483,133 yds. the previous year. Of this, 635,344 yds. was done by corporation men by hand and machines, and the balance executed under contract. In addition, two coats of tar were applied to 40,286 super. yds. The cost of the work was 1.52d. per yard, as against 1.53d. the previous year.

Bolton Waterworks Bill.—Strenuous opposition is to be offered by the urban district councils of Turton, Farnworth, Kearsley, Little Hulton, Worsley, Westhoughton, and Bartlam-cum-Trafl to the Waterworks Bill which the Bolton Corporation is promoting in the next session of Parliament. The Bill, which involves an expenditure of £2,500,000, is to provide four new reservoirs in the valleys of Hindburn and Roebourn, to ensure a century's water supply for Bolton and district. All the authorities represented in the opposition obtain their water from Bolton, and opposed the Bolton Waterworks Bill in 1905.

SCOTTISH NOTES.

[In the hope of making these notes as practically useful as possible the writer invites readers to favour him with communications thereon from time to time. They might be constructively critical, or helpfully supplementary, might indicate new points upon which information is desired, or might merely convey information. Communications will reach the writer if addressed "Scottish Notes," 24 Bride-lane, Fleet-street, E.C.]

Housing and Town Planning. At a housing and town planning conference held in Glasgow in November last, it was again and again strongly urged on local authorities to proceed with town-planning schemes *now*, so that at the end of the war there might be found suitable and sufficient work for members of the building and allied trades now serving with the Colours. In a recent issue of the *Glasgow Herald* it was stated that the town-planning scheme prepared by the City of Dunfermline had been in the hands of the Local Government Board—for final approval—since August, 1915. If the oft-expressed wish of the leaders of the above conference is to be realised, and if town-planning schemes are to be of any benefit at the conclusion of hostilities, it is to be hoped that the experience of Dunfermline will not be repeated. Admitting that the energies of the staff of the Local Government Board have been absorbed on war work, some way out must be found, and some speeding up resorted to, otherwise there is little hope of meeting the urgent demand for housing accommodation which undoubtedly exists in Edinburgh, Dunfermline, Clydebank, Mid-Lanark, and other Scottish centres. Meantime there is a danger of the Town Planning Act becoming—for all practical purposes—a dead letter.

* * * *

Experimental Roads. In the spring of 1913 there were laid down in several districts of Scotland experimental stretches of roadway, constructed according to a specification agreed upon between the Road Board and the Scottish branch of the Institution of Municipal and County Engineers. The supervision was undertaken by the engineering staff of the Local Government Board, and a report on the trials was to be issued to members of the institution. The writer has seen several of the roads, but the profession as a whole are not aware of the results. In view of the fact that many local authorities have practically ceased road operations during the war, and that a large amount of work will require to be done on its termination, it would be of very great value to surveyors if the report referred to were now forthcoming.

* * * *

Public Works in Contemplation. Recently the Board of Trade invited local authorities to inform the board of public works which were likely to be undertaken at the close of the war. From the reports of town and county council meetings appearing in the public Press, it would appear that a large amount of useful work is contemplated, but it is to be feared that, with the despatch of the returns to the board, the matter will in many cases be, for the present, lost sight of. If this should prove to be correct, it will indeed be unfortunate. All over the country rigid economy in the expenditure of public money is being insisted on. Responsible officials should therefore seize this period of comparative quiet to mature their schemes, so that when work is urgently required valuable time will not have to be lost in the drawing office. Burgh engineers will be well advised to formulate their "after the war work" now, so that delay may be reduced to a minimum.

* * * *

Sizes of Sewers. In connection with a large housing scheme, there was recently submitted to a town council for their approval a drainage scheme in which a number of sewers were shown at 6 in. diameter. On the recommendation of the surveyor the council decided that no sewer laid in a street should be less than 9 in. diameter. In support of his case the surveyor stated that, while 6 in. might be theoretically correct, he had found from practical experience that it was too small, and on more than one occasion he had been obliged to remove sewers of this size—not on account of additional drainage being admitted, but by reason of the expense and annoyance caused by repeated choking.

One wonders what has been the experience of other surveyors.

* * * *

Ventilation Shafts. In connection with more than one housing scheme recently undertaken in Scotland, ventilation shafts have been left out of the separate house-drainage systems. The writer believes that the Dunfermline City Council were the first to allow this in connection with the operations of the Scottish National Housing Company at Rosyth. Might one appeal for a description of the methods adopted?

* * * *

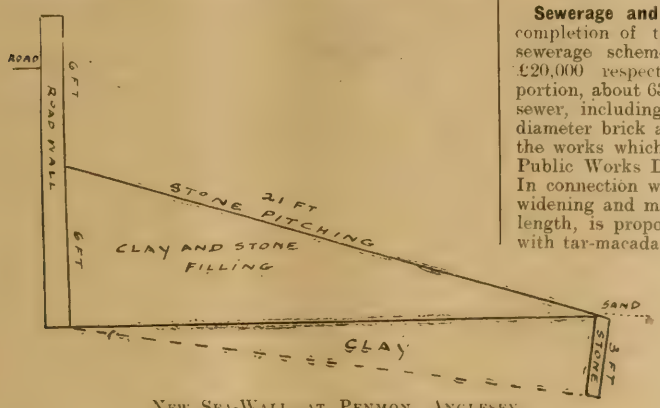
City Garden Allotments. The utilisation of uncultivated land for the production of food has been taken up with enthusiasm in Scotland. The matter has been under consideration by the majority of town councils, and in many towns it has been decided to plough up portions of public parks and pleasure grounds. The City of Edinburgh has given the matter a very great deal of attention. A large number of allotments have already been taken up, and, the demand still continuing, it has been decided to form another 2,000. Over 110 acres of derelict land within the city bounds are being set apart for this purpose. The Herriot Trust, the Hope Trust, and the Merchants' Company are also offering land for allotments. Mr. McHattie, the chief city gardener, has been a moving spirit in the matter, and is at present delivering a course of lectures on "Garden Allotments, and How to Work Them." With so many amateurs entering the sphere of agriculture these lectures will prove of very great value, and are well worthy of imitation in other centres.

AN ANGLESEY SEA-WALL.

By J. KERSHAW,

Surveyor to the Aethwy, Anglesey, Rural District Council.

The accompanying illustration is of a sea wall recently constructed at Penmon for the Aethwy, Anglesey, Rural District Council, under my supervision and from my design. The plan has been made to suit the place, as it is extremely exposed, and in rough times the sea is very heavy. It will be observed that the wall is 12 ft. high; in spite of this, the sea



NEW SEA-WALL AT PENMON, ANGLESEY.

is sometimes capable of throwing stones over into the road.

I think it will be agreed that the plan is quite original. The usual contention is that pitching should come to a diminishing point, but the head stone has been substituted, embedded in the clay. The object is that, in case of further erosion, sufficient warning will be given by the exposed stone, while a continuation could easily be carried out into the shore, and the head stone would be a stronghold between the old and new section.

Allowances to Municipal Employees on Service.—In regard to corporation employees who have joined the special corps of the Royal Engineers for road construction in France, it has been decided by Brighton Town Council to grant them war allowances sufficient to bring their Army pay and separation allowances equal to their civil pay at the time of enlistment.

HUDDERSFIELD MUNICIPAL PROJECTS.

PROPOSED EXPENDITURE OF £957,000.

The Corporation of Huddersfield have in contemplation several extensive and important works, some of which are of an urgent nature, particularly those relating to the housing question. Owing to the operations of British Dyes, Limited, and Messrs. L. B. Holliday & Co.'s new works, and the establishment of a Government factory, there has been a great addition to the population of the borough, and it is absolutely essential that something should be done at the earliest possible opportunity to provide housing accommodation for these people. The corporation received in 1913 the sanction of the Local Government Board for the borrowing of the money for the erection of working-class dwellings, but, owing to the restrictions imposed on local authorities in regard to expenditure, works have had to be suspended. The matter has become so serious, however, that it has been decided by the town council to ask the Ministry of Munitions to receive a deputation, in order to obtain, if possible, the necessary consent to proceed with the erection of a number of dwellings to meet the special circumstances. The following is a list of the works contemplated, most of which are of an urgent character—viz.:—

Highways.—Improvements and paving of main roads, £110,390; main road from Johnny Moor Hill to Milnsbridge, £42,000; Northumberland-street, extension to Leeds road, £14,000; new road from Ashgrove-road to Dalton Bank, £42,500; total, £208,890.

Sewage Disposal Works.—Extension, £150,000.

Sewers.—New sewers, &c., in connection with British Dyes works and subsidiary sewers, £94,950.

Tramways.—Doublings and renewals, £87,418; extension to Brighouse, £63,000; extensions at Longwood, Crosland Mill, Dalton, Ramsden-street, trackless cars from outlane to borough boundary, £60,000; total, £210,418.

Private Street Works.—New streets, £3,000.

Housing.—Working-class dwellings, £250,000.

Public baths and laundry, £16,000.

Education.—Extensions to girls' high school, £6,500; open-air school, £5,300; new elementary school, £12,000; total, £23,800.

Aggregate total, £957,058.

Sewerage and Road Works at Birmingham.—The completion of the Griffins Brook and Hall Green sewerage schemes, at a total cost of £16,000 and £20,000 respectively, and the reconstruction of a portion, about 633 yds. in length, of the Hockley main sewer, including the construction of 9-ft. and 10-ft. diameter brick and concrete barrel sewers, are among the works which it is proposed that the Birmingham Public Works Department shall carry out this year. In connection with road work, the completion of the widening and making up of Drews-lane, 1,100 yds. in length, is proposed, other projects being the coating with tar-macadam of a further length of about 3 miles of the carriageway of Bristol road, the paving with Leicestershire granite setts of the carriageway in Lawrence-street, and the construction of a small bridge over the River Rea at King's Norton.

Municipal Work at Douglas.—Judicious economy will be observed at Douglas, Isle of Man, during the present year, and no new or contemplated public works necessitating a large expenditure will be undertaken. Alien labour from the local detention camp is to be employed in quarrying, stone-breaking, and tarring, and in the resurfacing of many miles of roads in the borough. These road surfaces have not been extensively repaired during the war, but it is now proposed to restore them to their former condition, tar-macadam, tar-spraying, and tar-grouting being more extensively used. The cultivation of the Playing Fields, Villa Marina, the Pulrose estate, and several fields belonging to the corporation is being undertaken, and in places free allotments for the production of vegetables are being granted to ratepayers. The waterworks plantations are being improved with the further planting of considerable areas of the water-shed. The public baths, we are informed by the acting borough engineer and surveyor, Mr. A. D. Barron, are being altered for a special purpose, but part will be retained for public baths purposes.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars have reached us during the present week. Other reports will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Grimsby T.C.—The town council have decided to purchase 5 acres of land at Scartho, at £100 per acre, for the erection of a tuberculosis hospital. The mayor said that the land would be paid for out of revenue, spread over two half-years' rates.

HOUSING AND TOWN PLANNING.

Annfield Plain U.D.C.—A letter has been received from the Local Government Board in reference to the proposed scheme for the erection of 100 new workmen's houses at Dipton, suggesting that the council should submit the proposal as early as possible, so that official sanction could be obtained and the work proceeded with when the conditions were favourable. A committee of the whole council was appointed to inspect the land and fix upon a suitable site.

Barnsley T.C.—The borough surveyor, Mr. J. H. Taylor, reports that, owing to the discontinuation of building, there should be provided 500 or 600 houses. An early meeting of the town council is to be held to consider the matter.

Bristol T.C. — The city surveyor, Mr. L. S. McKenzie, submitted recently to the Sanitary Committee a report with reference to new works which are being constructed in the vicinity of the city. He pointed out that these would probably lead to the erection of a large number of workmen's dwellings, and he asked the committee to consider whether it was desirable that a town-planning scheme should be prepared for the undeveloped land likely to be developed. If that was done, it would lead to this new suburb being treated according to modern ideas, and it would prevent any repetition of the deadly monotony of workmen's houses such as had been built in the past. The committee thanked the city engineer for his report, and requested him to prepare a scheme under the Housing and Town Planning Act.

Dundee T.C.—The Housing and Town Planning Committee on Monday considered the question of a town-planning scheme at Clepington. In the course of the discussion it was stated that if a housing scheme were entered upon care must be taken not to burden it with the cost of slum property demolished. It was intimated that the city engineer, Mr. J. Thomson, would submit a report and scheme in the near future, and that the idea was to have all the preliminary arrangements matured against the end of the war.

Glasgow T.C.—The city council last week discharged Bailie Drummond and the town clerk's committee on housing and referred to the Special Committee on Housing and General Town Improvement their report, in which they asked for power to select on ground belonging to the corporation a site or sites suitable for the erection of dwelling-houses, and prepare plans of the houses proposed, reserving for determination later the borrowing powers to be exercised and the time when the erection of the houses should be proceeded with.

Hendon R.D.C.—In view of expected building developments after the war, the council are making application to the Local Government Board for a town-planning scheme embracing the parishes of Great Stanmore, Little Stanmore, and Edgware.

Kilwinning T.C.—The town council have formed themselves into a committee for the promotion of a housing scheme for the burgh.

Romford R.D.C.—The council are applying to the Local Government Board to sanction a town-planning scheme for Northwood Hemstead and the village of Hornchurch.

MOTOR TRANSPORT.

Accrington T.C.—It is proposed to purchase another motor waggon for the Health Committee.

Barnsley T.C.—Owing to the difficulty of obtaining a motor fire engine, and the refusal of the Local Government Board to sanction a loan, it has been agreed as an emergency to purchase two motor cars for the use of the fire brigade, at a cost not exceeding £500, to be paid out of revenue.

Cheadle and Gatley U.D.C.—Particulars are being obtained of suitable motor tractors for highway and fire brigade work.

ROADS AND MATERIALS.

Banffshire C.C.—The Upper Banffshire District Committee have appointed a committee to consider the question of constructing a road to Corhabbie, Glenrinnes.

Oavan C.C.—At the meeting last week a report was submitted by the county solicitor on the prosecution of road contractors. Commenting upon this, Mr. F. M'Govern, J.P., stated that there were roads in such a neglected state that it was not safe to drive a donkey cart over them. It would be a godsend to get rid of the bad contractors, and the only way to deal with them was by putting the law in motion. It was becoming quite a practice for men to tender for roads to cut out somebody else, to neglect the work, and then make a canvass of county councillors and district councillors to prevent a prosecution.

Cookstown (Co. Tyrone) R.D.C.—The county surveyor, Mr. J. W. Leebody, asked for an expression of opinion regarding a scheme of direct labour. Dungannon Council had, with one dissentient, agreed to consider a scheme if formulated by the county council, and he asked Cookstown to do the same. He proposed to deal only with leading roads, and he divided the district into five groups. On each group he proposed to have a foreman and staff, and the total expenditure would be limited by the amount at present spent in maintenance. All the roads would be offered for contract, and if a suitable contractor could be obtained the council would accept the tender, but if not the road would be maintained by direct labour. After discussion, the council by eleven votes to nine declined to ask the county council to formulate a scheme.

Cornwall C.C.—The county surveyor, Mr. L. D. Thompson, has been authorised by the Highways Committee to arrange for the supply of German prisoners for quarrying and road work. In reply to a question as to the rate of wages to be paid to the men, it was explained that the employers would pay full market wages, and that the balance would go to the military authorities.

Derry C.C.—The council have approved of resolutions from rural district councils asking for the sanction of the Local Government Board to the increasing of the limits of road expenditure. The increases sought were: Coleraine, from £8,868 to £9,200; Limavady, by £500; Derry No. 1, by £900; and Magherafelt, £800—all for a period of three years.

Enfield U.D.C.—The deputy surveyor, Mr. T. Briscoe, reports that with two exceptions all the owners of property concerned have agreed to give up the land necessary for the widening of Ordnance-road, and he was instructed to proceed with the work as far as possible.

Forfarshire C.C.—It was stated at the Forfar District Committee meeting that the committee had agreed to release every possible roadman in their employment for road-making service in France. Inquiry had been made whether in that event the Road Board would be prepared to make a grant towards the cost of restoring the roads after the war was over, but no reply had been received. In the interval the rate of wages offered had been reduced from 3s. to 1s. 8d. for men of military age. In these circumstances it did not appear as if there was any special urgency in the matter. The committee authorised the surveyor to lend any road-making plant that was to spare and to await further inquiry regarding the request for the services of the roadmen.

Margam U.D.C. — The chairman, Mr. Edward Lewellen, reported that he had seen the manager of the Road Board in London relative to the new Avon Valley road, and had emphasised the necessity of through communication between Glyncorrwg and Port Talbot. The manager informed him that the Road Board would raise no objection to the council proceeding with the work of linking up the council's portion with the new portion constructed by the Glyncorrwg

Council. The surveyor, Mr. John Cox, reported that the county surveyor had applied for £500 from the Road Board on further account of the work.

Norfolk C.C.—The Western Highways Committee have adopted a similar course to that agreed to by the Eastern Highways Committee on the subject of a war bonus to the district road surveyors—viz., to allow a bonus of £10 a year, with a further £10 a year for travelling expenses, for the duration of the war.

Northants C.C.—The council have approved a scheme prepared by the county surveyor, Mr. C. S. Morris, for the improvement of the four cross roads at Finedon, at an estimated cost of £250.

Scarborough R.D.C.—Correspondence has been received from the North Riding County Council as to a proposed new road from Cayton to Folkton. The Highways and Bridges Committee were of opinion that the improvement was a desirable one for the neighbourhood and was much needed. They were of opinion that the road in question should be constructed to a width of 16 ft., and that the making of the road be left in the hands of the county council, the rural district council agreeing to take over and maintain the highway after it had been suitably constructed.

Totnes R.D.C.—It has been agreed to ask for the services of twenty German prisoners on the roads.—A committee has been appointed to consider the appointment of a surveyor in the place of Mr. H. Vickery, resigned.

Welton R.D.C.—The Highways Committee reported that the appeal tribunal had decided to grant the surveyor (Mr. W. Starkie) exemption from military service to February 1st, and it was resolved that during his absence on military service the district councillor for each parish be authorised to supervise the repair of the highways in the parish and the manual and team labour thereon. It was also resolved that the surveyor's books be kept by Mrs. Starkie at a salary to be hereafter fixed, and that the working of the steam rollers, the ordering of road material, and the general supervision of the highways in the district be done by a sub-committee. Mr. R. Sergeant, however, contended that councillors could not overlook their own parish. He proposed they advertise for a temporary surveyor. After some discussion the proposition to advertise for a temporary surveyor was carried by fifteen against six, and it was decided to offer a salary of £100.

SEWERAGE AND SEWAGE DISPOSAL.

Southampton T.C.—The borough engineer, Mr. J. A. Crowther, has received instructions to report on the possibility of protecting Northam from flooding by storm-water, sewage, and abnormally high tides.

Staffs C.C.—The county medical officer has advised the county council to press upon the district council of Amblecote the necessity for an improved method of refuse removal and the termination of the present contract system, and the provision of a mortuary and disinfecting apparatus.

Tredegar U.D.C.—The accountant (Mr. A. P. J. Gough) submitted an account of the district sewerage scheme as computed by the contractors, Messrs. Baines, Chaplin & Co. The tender was £24,912, and the estimated mileage 23 miles 440 yards, the estimated cost being £1,071 per mile. The amount of additional work was £514. The loan sanctioned was £31,000, and the total paid to the contractors was £23,459. The balance left for house connections was £7,544, the amount spent on house connections up to December 1st being £2,916, leaving a balance unspent of £4,623.

Wath R.D.C.—Specifications are being prepared by the sanitary inspector of an improved sewerage system for Rainton.

WATER, GAS, AND ELECTRICITY.

Dublin T.C.—The chairman of the Electricity Supply Committee stated that, despite restrictions and increased cost of material, they were able during the last financial year to pay off £32,000 of capital, £24,000 in interest, and make a nett profit of nearly £9,000.

Exeter T.C.—With reference to the notice from the Board of Trade, substituting "calorific power" for "illuminating power" in the public gas lighting, the Lighting Committee have resolved that the Board of Trade be requested to provide in the Order that a gas examiner appointed under the Gasworks Clauses Act, 1871, for the purposes of the Order may at the prescribed testing place, or at any public lamp as and when he thinks fit, test the pressure at which the gas is supplied, and that the company shall afford to the examiner all reasonable facilities for making the test.

Llandudno U.D.C.—The council have approved a recommendation of the Gas Committee that in future the manager of the gasworks, Mr. M'Gregor, should be given full control of all gas mains and services in the town, and that he be instructed to take steps with a view to ascertaining the cause of the excessive amount of unaccounted for gas and of reducing the loss thereby caused. During the year ended on March 31st last the gas unaccounted for amounted to 12·4 per cent of the "make," as compared with 9·7 per cent in the previous year.

Penistone R.D.C.—An intimation has been received from the Penistone Urban District Council of their intention to increase the price of water supplied by them to the rural council, and to the Darton Urban Council from 6d. per 1,000 gallons to 7½d. per 1,000 gallons, on account of the increased outlay incurred in providing a water supply. The agreement has still six years to run, and the rural council see no reason why the price according to agreement should not be adhered to. It was decided to defer the matter for a month in order to ascertain the opinion of the landowners in the area.

Standish, Lancs, U.D.C.—The council have agreed to obtain expert advice on the water supply, the normal supply having been seriously affected after a breakage in the mains.

Swansea T.C.—The Water and Sewers Committee have authorised the engineer to purchase and fix water meters up to an amount not exceeding £1,000. The committee recommend that a pumping plant be installed in Carmarthen-road for the purpose of pumping water, if necessity arises, from the low-level supply to the high-level supply. The estimated cost is £1,000.

Truro T.C.—The council have accepted the offer of the gas company, at £1 2s. 3d. per lamp, for public lighting.

Weymouth T.C.—The Electricity Committee have received authority to spend £500 on electricity extensions.

MISCELLANEOUS.

Hythe T.C.—With reference to a proposal to spend out of revenue £420 in preparing and planting beds of shrubs on the canal bank, placing a new ornamental iron fence on each side of the Ladies'-walk, shrub planting in that thoroughfare, and hedge planting in The Grove, it was stated that the Local Government Board had written asking for the observations of the town council on a letter sent by a town councillor raising objections to the scheme. The mayor now stated that the town council having agreed by a majority to go on with the work, he would, if they would allow him, pay for such work by advancing the money, without any interest, the sum to be repayable after the war, when they reached normal times of peace again. As a business man, they might take his word for it that the cost would be far greater after the war than now.

Norfolk C.C.—The county surveyor, Mr. W. W. Gladwell, reports that the repairs to roads are being carried out as expeditiously as possible with the labour available. There are 114 fewer men employed upon the roads than at this time last year, and, in consequence, work other than that appertaining to repairs has had to be practically abandoned. One-fourth only of the orders for granite have been completed, and the shortage on gravel deliveries is also considerable. Great difficulty is experienced in obtaining carters. The roads are appreciably suffering from these causes, and the heavy traffic to which they are being subjected. Four of this council's district surveyors and 140 steam-roller drivers and roadmen have enlisted. Two of the latter have been discharged as being medically unfit, four are reported missing, and eleven have been killed. The total number of surveyors and men from the county who have enlisted and will be transferred to the new road service from the units to which they are now attached, and those who have volunteered is as follows: Norfolk County Council, 11 surveyors, 156 men; urban and rural authorities, 9 surveyors, 91 men; other sources, 86 men; total 20 surveyors, 336 men.

Rhyl U.D.C.—It was stated at the council on the 8th inst. that a large quantity of the sand drift has

been arrested by the planting of marram grass, and that the storm had not affected the planted area very much. Letters were read from property owners consenting to the planting of the grass in front of their houses. Regarding the sea defences, a report was presented by the surveyor, Mr. A. A. Goodall, who warned the council that if erosion takes place during the next six months, as at present, there will be serious trouble in the west end. The council thereupon decided to call a special meeting to deal with the matter. The Board of Trade had already been approached on the subject of coast erosion, but they replied they had no funds to deal with the matter, and referred the council to the Development Commissioners.

PERSONAL.

Mr. Percival H. Audsley, building surveyor to the Dewsbury Town Council, has been gazetted Second Lieutenant.

Mr J. H. Castle, surveyor to the Goole Urban District Council, has been granted a commission in connection with the Roads Battalion.

Captain J. N. Prior, Royal Engineers, sanitary inspector to the Sevenoaks Rural District Council, has been awarded the Military Cross.

Prof. E. R. Matthews, ASSOC.M.INST.C.E. (Captain R.A.M.C., C.O. Sanitary Company, 17th Division), has been elected a Membre Société des Ingénieurs Civils de France.

Mr. W. Truscott, acting surveyor to the Liskeard Rural District Council, having received final exemption by the tribunal to March 31st, the council have decided to advertise for a successor.

Mr. E. L. Lunn has been unanimously selected by a special committee of the corporation to act as borough surveyor and engineer of Guildford during the absence in France of the borough surveyor, Mr. E. Young Harrison.

Mr. A. Courtney Groves, surveyor to the Newhaven Rural District Council, met with a motor-cycle accident recently, colliding with a horse and cart. He was taken to the Lewes Victoria Hospital, and afterwards conveyed home, where he is making a good recovery.

Mr. John Fawcett, the sanitary inspector, has been appointed surveyor to the Blyth Urban District Council, in succession to Mr. R. Grieves, resigned, and Mr. J. Backhouse, the assistant sanitary inspector, has been promoted to the post of sanitary inspector.

Lieutenant A. W. Edmett, Royal West Kents, to whom reference was made last week, was an assistant in the office of the Slough urban surveyor when he joined the Army (not assistant surveyor). He received his wound not in the first advance on the Somme, which commenced on July 1, 1916, but on September 15th.

Mr. A. C. James, engineer and surveyor to the Grays Urban District Council, and Mr. S. A. Hill-Willis, engineer and surveyor to the Tilbury Urban District Council, are to supervise the disposal works of the Thurrock, Grays and Tilbury Joint Sewerage Board, on alternative months, while the manager, Mr. Holgate, is away on military service.

Mr. E. Young Harrison, borough surveyor of Guildford, has been granted a commission as Captain in the Royal Engineers, to command one of the Road Construction Companies now being formed to take over the road work in France. Mr. Harrison is to command the Surrey Company, and anticipates that when he goes to France members of his own staff who are already serving there with the Labour Battalions will be enrolled under him.

Second Lieutenant D. Higgins, London Regiment, the assistant surveyor to the East and West Molesey Urban District Council (who was awarded the Military Cross), is now in a London hospital, where it is hoped he will make good progress after his second operation. It was stated at a meeting of the council that the surveyor, Mr. J. Stevenson, said he had endeavoured to ascertain for what particular act of bravery the cross was awarded, but Lieutenant Higgins declined to disclose this, saying he merely carried out orders. "That is the true hero's spirit," said the chairman.

Mr. S. H. Newsome, an assistant surveyor in the Sheffield city surveyor's department, has received a commission in the Royal Engineers. Mr. Newsome, who has been in the Army for several months, is the third assistant from the department who has received a commission in one or other of the engineering units. Lieutenant Brierley (divisional surveyor) and Lieutenant Hassall (chief assistant, sewers department), each of whom has seen service in Gallipoli and in France, have been wounded in recent advances, and Mr. Brierley is a patient at the Third Northern General Hospital. Five members of the city surveyor's outdoor and clerical staff have been appointed non-commissioned officers in the new Road Corps.

Private R. Emsley, one of the workmen at the Hove Corporation cemetery, has been awarded a bar to the Military Medal already bestowed upon him for conspicuous gallantry and untiring devotion to duty displayed at the Schwaben Redoubt during the operations of October 21, 1916. Private Emsley, who was a stretcher bearer, worked untiringly, frequently under heavy shell fire, removing wounded in the area behind the captured German line. He then went to the captured position and brought wounded away. Seeing that the numbers were more than the regimental stretcher bearers could cope with, he personally went to the advanced dressing station and brought R.A.M.C. bearers back. He showed them where the wounded were, and it was largely owing to his devotion to duty that, when this battalion was relieved in the night, all wounded had been evacuated from the captured trench. He continued to work until completely exhausted, and was a striking example of devotion to duty to his comrades. He had been awarded the Military Medal for a similar act of gallantry.

OBITUARY.

The late Mr. F. W. Manuelle, head of the firm of A. & F. Manuelle, granite merchants, left property of a gross value of £79,369.

Lieutenant J. H. Taylor, son of the borough surveyor of Barnsley, has been killed in action, we regret to state. At the meeting of the town council last week a vote of condolence with Mr. Taylor and family was passed.

Mr. John Swift, surveyor to the Penistone Urban District Council for twenty-six years, died somewhat suddenly last week, at the age of sixty-two. Mr. Swift's youngest son, Private Charles Edward Swift, was killed in France in September, and this had been a sad blow to the father.

Mr. Herbert Batsford, managing director of the well-known firm of architectural publishers and booksellers, B. T. Batsford, Limited, High Holborn, died somewhat suddenly at his residence at Golder's Green on the 14th inst., after an illness extending over nine months. Mr. Batsford was the last surviving son of the late Mr. Bradley Thomas Batsford, the founder of the business, with which he has been connected for over thirty-five years. He was associated on the board of directors with Mr. Harry Batsford, his nephew, and Mr. W. Hanneford Smith, who have both been engaged in the direction of the business for many years, and will in future carry on its work.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

APPLICATIONS FOR LOANS.

Dublin T.C.—£100,000 for extensions of the electric light system, and £12,600 for the utilisation of the tramway system in the conveyance of refuse, and the provision of a depot.

Listowel R.D.C. £1,000 for the construction of the Ballegan road.

LOANS SANCTIONED.

Derry C.C. £10,000 for the repair of damages to roads and bridges by floods.

Kettering U.D.C. £950 for the purchase of a motor fire engine.

LOANS REFUSED.

Holland C.C. £1,700 for a steam motor tractor and trucks.

Southend T.C.—£328 for proposed surface-water drainage works.

FORTHCOMING INQUIRY.

FEBRUARY. £

1.—**St. Annes-on-the-Sea.** For the construction of open-air sea-water baths and laying out Ashton Gardens (Mr. A. G. Drury) 16,934

DISPOSAL OF DESTRUCTOR WASTE SCRAP.

A PROFITABLE INSTALLATION AT HORNSEY.

A hydraulic pressing plant for baling tins has been installed at the sanitary depot of the Hornsey Town Council, and an interesting and instructive report dealing with its operation and the disposal of the waste metal has been prepared by the borough engineer and surveyor, Mr. E. J. Lovegrove, M.INST.C.E.

The estimated cost of providing the press and shed, with connection to existing accumulator and constructing an open firing hearth for burning the tins, was £150, and the work has been carried out within this amount; but a specially designed furnace has been built in lieu of the firing hearth for burning off the tins and the collection of solder dross. In connection with this question, Mr. Lovegrove refers to the arrangements made for, and the income derived from, the disposal of waste scrap before the war, during the first two years of the war, and to date. Up to the year 1912 the waste metal was removed by a British firm, Messrs. Henry Levin, Webb & Co., the highest annual receipts amounting to £113 for 197 tons. During 1912 an alien enemy firm secured the English market, removing the waste as under the previous contract, the highest annual receipts amounting to £136 for 194 tons. After the declaration of war the council discontinued to trade with this alien enemy firm, and complications ensued in the disposal of the waste; but, on communicating with Messrs. Levin, Webb & Co., arrangements were made under which the council removed the waste to their works, the receipts, after deducting the cost of cartage, falling, for the year 1915, to £74 for 201 tons.

It was then suggested by this firm that, if the council could deal with their own pressing and sorting of certain classes of scrap, an increased income would result and a regular market be controlled. The process suggested would, however, have involved additional labour, which would have been a somewhat heavy set-off against the profits. This has been obviated by the erection of the above-mentioned furnace, which is heated by the destructor flue gases, and arranged between the tipping platform and the press in such a way that the work is now being satisfactorily carried on without increasing the staff engaged on the old processes.

In the result the council were able to enter into a contract, as from October 1st last, for supplying, at advanced prices, to Messrs. Levin, Webb & Co. pressed de-tinned scrap, galvanised scrap, light waste and solder, the whole process of preparation, including refining of the solder, being carried out by the town council's own staff. "From the first three months' working it is evident," says the borough engineer, "that the committee's decision to deal with the work in this way has been fully justified, as the annual receipts for 194 tons will amount to £203. Notwithstanding the difficulty in disposing of the waste metal, the destructor yard has throughout been kept clear of accumulations, and it may now be said, in every sense of the term, that the trade has been secured, with an increase of about 49 per cent upon the returns received from pre-war German trading, and this by a simple process, involving no material encroachment upon the yard space or additions to the working staff, and at a comparatively nominal capital outlay."

Caerphilly's Projected Works. — Owing to the restrictions imposed, works other than necessary works are suspended at Caerphilly for the duration of the war. The council are promoting a Motor Omnibus Bill in the next session of Parliament. Immediately times are normal, owing to the industrial character of the district, a vast amount of new work will be taken in hand, among which may be mentioned the following—viz.: Public abattoirs, new council offices, various sewerage works, private street works, public improvement works, &c., in addition to the ordinary routine work of the district. The council, we are informed by the engineer and surveyor, Mr. T. H. Richards, are taking immediate steps to obtain land in various portions of the district for the cultivation of allotments under the Cultivation Land Order, 1916. During recent years the council have already obtained land—about 50 acres—which is laid out for allotments. The department, it should be added, is severely handicapped owing to the staff having joined the Army.

MUNICIPAL WORK AT PORTHCAWL.

AFTER-THE-WAR SCHEMES.

During the past twelve months the Porthcawl Urban District Council have carried out some important work, comprising a length of 8 miles of 8-in. water main from their Craig-yr-Aber reservoir to the service reservoir at Ty Coch (within their district), at a cost of £7,000, providing the town with a continuous supply throughout the year. An extensive sewerage scheme for the western portion of the district, comprising sewers ranging from 9 in. to 30 in. in diameter, and outfall works has also been completed, at a cost of £10,000. The consulting engineers for the two schemes were Messrs. John Taylor & Sons, Westminster.

A large portion of the esplanade on the sea front has been asphalted at an outlay of about £650. Further, new sanitary conveniences have been erected, extensive road repairs carried out, and nearly 90,000 sup. yds. of road surface tar-sprayed. A new road is being formed leading from the esplanade to Sandy Bay. It has become necessary to proceed with extensive repairs to the timber piers at the harbour, and these works are now in hand.

The council are proceeding with a scheme for the utilisation of waste paper, and the material is being collected daily and properly baled for disposal.

It is not intended to embark upon any new work until after the war, when a new sewerage scheme for the eastern portion of the town, several private street works, and additional sanitary conveniences and shelters will be proceeded with. The council have under consideration the adoption of a town planning scheme, and the preliminary work the surveyor, Mr. F. Hatcher, reports, is now being prepared.

The question of food production has received close attention, and land has been secured and is now being ploughed up for the allotment holders.

AN ALL-METAL BUNDLING PRESS.

The economical disposal of such materials as waste paper, leather, rags, tin chippings, and so forth, is a question that is daily growing in importance, and is one of particular interest to municipal engineering officials. The accompanying photographic views show the operation of an all-metal bundling press, manufactured by Messrs. Hollings & Guest, Limited, Thimble Mill-lane, Birmingham. The left-hand view

shows how the press can be used as a bin, and the other the interior of the machine after the waste material has been pressed. While it is claimed to be the most powerful hand-baler in the world, the labour required for its operation is extremely light. The press takes up very little room, and, being all metal, is fireproof; paper baled in it is said to be practically non-inflammable.

Municipal Work at Blackpool.—The corporation are promoting a Bill in Parliament in the session of 1917 for amalgamating the adjoining urban district of Bispham and part of the parish of Carleton with the borough. It is also proposed to carry out new sea defence works, about 2½ miles in length, and to construct two sea-water open-air swimming baths on the foreshore. A scheme is also being prepared to enlarge the main drainage of the borough as proposed to be extended, so as to prevent flooding in times of heavy rainfall and high tides. All work of street improvements and the making up of private streets—works urgently required—are necessarily being held up during the war.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

TEMPORARY ASSISTANT.—January 29th.—West Hartlepool Town Council. £120 per annum.—Mr. Nelson F Dennis borough engineer, Municipal Buildings, West Hartlepool.

WORKS FOREMAN.—January 29th:—Corporation of Leigh, Lancs. £2 per week.—Mr. W. H. Cowburn, town clerk, Town Hall, Leigh.

TEMPORARY ASSISTANT.—January 29th.—Somerset County Council. £120 with £20 for motor cycle.—Mr. Gordon R. Folland, acting county surveyor, Wells, Somerset.

WATER INSPECTOR.—January 29th.—Epsom Urban District Council. £2 2s. per week.—Mr. T. N. Young, engineer-manager, Waterworks, East-street, Epsom.

ROAD AND GENERAL FOREMAN.—February 1st.—Weymouth Town Council. £2 10s. per week.—Mr. F. Fernihough, town clerk, Municipal Offices, Weymouth.

TEMPORARY ROAD FOREMAN.—February 5th.—Merton and Morden Urban District Council. £2 15s. per week.—Mr. G. Jerram, engineer and surveyor, Council Offices, Kingston-road, Merton, Surrey.

TEMPORARY SURVEYOR AND INSPECTOR.—February 6th.—Ruislip-Northwood Urban District Council. £200 a year.—Mr. Edmund R. Abbott, clerk, Council Offices, Oaklands Gate, Northwood, Middlesex.

ENGINEERING FITTER.—February 8th.—Gosport and Alverstoke Urban District Council. £2 7s. 6d. per week.—Mr. H. Frost, surveyor, Council Offices, Gosport.

TEMPORARY CLERICAL ASSISTANT.—Office of a municipal engineer in the North-West of London. £3 3s. per week.—Box 1,602, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, London, E.C.

SANITARY INSPECTOR.—Government of Nigeria. £250—£300.—Crown Agents for the Colonies, 4 Millbank, London, S.W.

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

Buildings.

HALIFAX.—February 2nd.—For additions to a hospital kitchen, for the Board of Guardians.—Messrs. Clement Williams & Sons, architects, Post Office Buildings, Commercial-street, Halifax.

TETUAN (Morocco).—February 16th.—For building a market at an estimated cost of £7,000, for the authorities Spanish Protectorate, the "Junta de Servicios Locales," Tetuan, or the Morocco Section of the Ministry of State, Madrid.

Engineering: Iron and Steel.

MANCHESTER.—February 2nd.—For the supply and erection of two reinforced cooling towers, for the Electricity Committee.—Mr. F. E. Hughes, secretary, Electricity Department, Town Hall.

WOODFORD.—February 6th.—For the supply and erection of two 15—16 b.h.p. gas engines (Crossley, National, Stockport, or Tangye), and two Stereophagus pumps, at the eastern sewage works, for the Urban District Council.—Mr. W. Farrington, surveyor, Council Offices, Woodford Green, Essex.

FRESHWATER, I.W.—February 10th.—For repair of the [illegible] at the parish council.—Mr. J. Gilbert, clerk, Attabella, Heathfield-road, Freshwater, I.W.

BEDFORD.—For [illegible] at the electricity works, for the corporation.—Mr. R. W. L. Phillips, borough electrical engineer, Town Hall.

Roads.

WARRINGTON.—January 29th.—For the supply of [illegible] for the corporation.—Borough Surveyor, Town Hall.

LEATHERHEAD.—January 30th.—For the supply of about 400 barrels of refined tar, for the urban district council.—Mr. Sidney R. Drake, surveyor, Council Offices, Leatherhead.

MIDDLESBROUGH.—January 30th.—For the supply of broken and unbroken whinstone, limestone, and tarred slag and whinstone, for the rural district council.—Mr. W. H. Dixon, district surveyor, Kirkby-in-Cleveland, near Stokesley, Yorks.

OTLEY.—January 31st.—For the supply of setts, kerbs and flags, granite macadam, pitch and tar, slag dust, tar-macadam, limestone macadam, and brushes, for the urban district council.—Mr. O. Holmes, surveyor.

NESTON.—January 31st.—For the supply of broken stone, chippings, and tarred macadam, for the urban district council.—The surveyor, Town Hall, Neston, Cheshire.

NORTHANTS.—January 31st.—For the supply of broken granite, tar-macadam and slag, for the county council.—Mr. C. S. Morris, county surveyor, County Hall, Northampton.

STOKESLEY.—February 1st.—For the supply of broken and unbroken whinstone, tarred limestone, and tarred slag and whinstone, for the rural district council.—Mr. W. H. Dixon, district surveyor, Kirkby-in-Cleveland, near Stokesley, Yorks.

CANTERBURY.—February 1st.—For the supply of broken granite, granite chippings, granite dust, granite channelling, granite kerbing, and stoneware sewer pipes, for the corporation.—Mr. A. C. Turley, city surveyor, Municipal Offices.

HERTS.—February 1st.—For the supply of refined tar (to comply with the terms of the Road Board Specification, No. 1), for the county council.—Mr. J. S. Killick, county surveyor, County Surveyor's Office, Hatfield.

WESTBOURNE.—February 1st.—For the supply of hand-picked field stones and Portfield gravel, for the rural district council.—Mr. H. Norris, surveyor, West Ashling, Chichester.

HORNCASTLE.—February 3rd.—For the supply of about 4,643 tons of granite and about 1,807 tons of slag, for the rural district council.—Mr. J. E. Chatterton, clerk, Council Offices, Horncastle.

BEDWAS AND MACHEN.—February 3rd.—For the execution of road improvements and the construction of about 100 lin. yds. of concrete culvert, for the urban district council.—Mr. A. S. V. Taylor, Council Offices, Bedwas, Mon.

BATH.—February 3rd—7th.—For the supply of black rock, granite, flint, or other approved road stone, black rock gravel, Portland cement, fine and coarse sea sand, and lubricating oils, for the corporation.—City Surveyor.

EAST RIDING.—February 5th.—For the supply of about 8,000 tons of stone for macadamising the main roads, for the county council.—The County Surveyor, Beverley.

LITTLE HULTON.—February 5th.—For the supply of broken granite, 4 by 5 granite setts, tar-macadam, granite, limestone and slag chippings, grit, kerbs, stoneware pipes and gullies, and steam road rolling, for the urban district council.—Mr. J. H. Heyes, clerk, Council Offices, Little Hulton, Bolton.

SUNBURY-ON-THAMES.—February 5th.—For the supply of about 10,000 gallons of refined tar, for the urban district council.—Mr. H. F. Coales, surveyor, Council Offices.

SUTTON-IN-ASHFIELD.—February 5th.—For the supply of tar-macadam and broken slag, for the urban district council.—Mr. W. Burn, surveyor.

RUGBY.—February 5th.—For supplying horses and carts for road repairs, watering streets, and scavenging, for the urban district council.—Mr. J. H. Sharpe, surveyor, Benn Buildings, Rugby.

RENFREW.—February 5th.—For the supply of metal, borders, setts, and chippings, for the Upper District Committee.—Mr. R. Drummond, road surveyor, Fairfield, Paisley.

HIPPERHOLME.—February 6th.—For the supply of 2½-in. granite macadam, for the urban district council.—Mr. G. Wharton Thompson, engineer and surveyor, Council Offices, Hipperholme.

SWANSEA.—February 6th.—For the supply of about 12,000 or 15,000 gallons of best quality distilled tar, for the rural district council.—Mr. Edward Harris, clerk, Council Offices, Alexandra-road, Swansea.

MIDDLESEX.—February 7th.—For the cartage of about 7,500 tons of broken stone, 2,000 tons of chippings, about 4,000 tons of gravel, hoggin, and shingle, horsing slop carts, water vans, tarring machines, rotary brooms and scrapers, and the hire of horse, cart and van per day, for the county council.—Mr. H. T. Wakelam, county engineer, Middlesex Guildhall, Westminster, S.W.

STOCKPORT.—February 7th.—For the supply of manual and team labour for paving and repairing carriageways, manual and team labour for mason's work on footpaths, and team labour for carting other materials, for the corporation.—Mr. John Atkinson, borough surveyor, Borough Surveyor's Office, Town Hall, Stockport.

TRING.—February 7th.—For the supply of blast-furnace slag, granite chippings, refined tar, flints, and hoggin, for the urban district council. — Mr. S. S. Gettings, surveyor, Surveyor's Office, Tring.

MIDDLESEX.—February 7th.—For the supply of about 7,500 tons of 2-in. and 1½-in. hand-broken basalt, and 500 tons of ⅜-in. clean chippings, for the county council.—Mr. H. T. Wakelam, county engineer, Middlesex Guildhall, Westminster.

LITTLEHAMPTON.—February 7th.—For the supply of distilled tar, for the urban district council.—Mr. W. A. Clegg, engineer and surveyor.

EASINGWOLD.—February 7th.—For the supply of whinstone and slag, for the rural district council.—Mr. F. J. H. Robinson, clerk.

BEXHILL.—February 9th.—For the supply of distilled tar, Tarvia, or other compounds for use in tar-spraying, for the corporation.—Mr. T. E Rogers, town clerk, Town Hall, Bexhill.

UXBRIDGE.—February 9th.—For the supply of granite, tarred granite and slag, gravel, flints and hoggin, and haulage, for the rural district council.—Mr. J. W. Harrison, engineer and surveyor, Corn Exchange, Uxbridge.

CAISTOR.—February 9th.—For the supply of about 5,000 tons of granite, about 5,400 tons of slag, about 550 tons of slag chips, and 200 tons of tar-macadam, for the rural district council.—Mr. A. A. Padley, clerk, Council Offices, Caistor, Lincs.

HEADINGTON.—February 10th.—For the supply of the best selected granite, broken and unbroken, and unscreened ½-in. granite chippings, for the rural district council.—Mr. A. Walker, district surveyor, Windmill-road, New Headington.

BRIDGWATER.—February 10th.—For the supply of stone and Tarmac, for the rural district council.—Mr. W. H. Cousins, surveyor, Union Workhouse, Bridgwater.

HERTS.—February 10th. — For surface tarring approximately 1,250,000 sq. yds. of main roads with refined tar, for the county council.—Mr. J. S. Killick, county surveyor, County Surveyor's Office, Hatfield.

CORNWALL.—February 10th.—For the hire of steam rollers, not exceeding ten, for a period of one year, for the county council.—Mr. L. D. Thompson, county surveyor, County Hall, Truro.

HERTS.—February 12th. — For the hire of steam and petrol rollers, for the county council.—Mr. J. S. Killick, county surveyor, County Surveyor's Office, Hatfield.

WALTHAM ABBEY.—February 12th.—For tar-spraying about 75,000 sq. yds. of roads, for the urban district council.—Mr. W. C. Holloway, engineer and surveyor, Town Hall, Waltham Abbey.

NORTHUMBERLAND.—February 12th.—For supplying, breaking and carting stone, for the county council.—County Surveyor, Moothall, Newcastle-on-Tyne.

LONG SUTTON.—February 13th.—For the supply of granite, slag, and granite chippings, for the urban district council.—Mr. S. S. Mossop, clerk, Long Sutton, Lincs.

NEWMARKET.—February 15th.—For the supply of about 1,000 tons of the best broken Leicestershire granite, 1½-in., 2-in., and 2½-in. gauge, 200 tons of best broken slag, 2½-in. gauge, 500 tons of granite or slag chippings, free from dust, ⅜-in. gauge, and 250 tons of ⅜-in. tarviated granite chippings, for the urban district council.—Mr. W. H. Eley, engineer and surveyor, Town Hall, Newmarket.

WETHERBY.—February 15th.—For the supply of refined tar in accordance with the Road Board specifications, for the rural district council.—Mr. E. H. Coates, clerk, Rural Council Offices, Wetherby, Yorks.

BOLSOVER.—February 21st.—For the supply of granite, limestone, slag, basalt, tarred limestone, tarred slag, refined tar, pitch, kerb, channel, sand, and stoneware pipes, for the urban district council.—Mr. J. F. Wardle, town surveyor, Council Offices, Bolsover, near Chesterfield.

MARPLE.—February 23rd.—For the supply of granite macadam and chippings, Macclesfield macadam and chippings, 6-in. grit stone setts, and sanitary pipes, for the urban district council.—Mr. D. J. Diver, surveyor, Council Offices, Marple.

COCKENZIE.—For supplying and laying about 170 yds. of good, second-hand causeway setts, for the burgh council.—Mr. R. Tulloch, burgh surveyor, Cockenzie, Scotland.

Sanitary.

HAMBLEDON.—January 29th.—For the collection and removal of refuse, for the rural district council.—Mr. F. Smallpiece, clerk, 138 High-street, Guildford.

ISLE OF WIGHT.—January 29th.—For the removal of house and other refuse, for the rural district council.—Mr. H. E. Stratton, clerk, 30 Pyle-street, Newport, I.W.

BRADFORD.—January 31st.—For the supply of 20,000 cotton double filter press cloths, for the corporation.—Mr. F. Stevens, town clerk, Town Hall.

THIRSK.—February 3rd.—For the removal of house refuse and cleansing earth-closets, for the rural district council.—Mr. E. Watson, Ashton Cottage, Sowerby, Thirsk.

ROWLEY REGIS.—February 6th.—For emptying and removing house refuse, for the urban district council.—Mr. D. Wright, clerk, Council Offices, Old Hill, Staffs.

LEEDS.—February 13th.—For the supply of press filter-cloths at Knostrop sewage works, for the Sewerage Committee.—Sewerage Engineer, Great George-street, Leeds.

Stores.

WILLESDEN.—January 30th.—For the supply of masons' and paviors' works, artificial slab paving, tar paving, and the execution of tar-paving works, gravel, flints, burnt ballast, broken granite, lime, cement, salt-glazed ware pipes, oils and chandlery, coal and coke, barging road slop, horse provender, ironmongery and tools, timber, wood-paving works, horses and carts, and drivers, for the urban district council.—Mr. O. Claude Robson, engineer, Municipal Offices, Dyne-road, Kilburn, N.W.

OXLEY.—January 31st.—For the supply of setts, kerbs, flags, granite macadam, pitch and tar, slag dust, tar-macadam, limestone macadam, and brushes, for the urban district council.—Mr. O. Holmes, surveyor.

MIDDLESBROUGH.—February 1st.—For the supply of annealed scoriæ (broken), bricks, castings, concrete flags and kerbs, Portland cement, pitch and tar, sanitary pipes, gullies, junctions, slag (broken), coal (for domestic use only), coke, timber, whinstone and granite (broken), whinstone and granite setts and kerbs, brushes, bolts and nuts, disinfectants, electric lamps, general stores, glass, hardware, india rubber goods, iron and steel, leather belting, oils, paints and varnishes, packings, picks, shovels and shafts, polishes and cleansing materials, and ropes, for the corporation.—Mr. Preston Kitchen, town clerk, Municipal Buildings.

GILLINGHAM (Kent).—February 2nd.—For the supply of road materials, Portland cement and lime, requisites for precipitation works, sewer ironwork, bricks, oils, general stores and ironmongery, and disinfectants, for the town council.—Mr. J. L. Redfern, borough engineer and surveyor, Corporation Offices, Gillingham, Kent.

SWANSEA.—February 2nd.—For the supply of gullies, lamp pillars, lanterns, paving, kerbing, channelling and pitching, disinfectants, broken syenite, broken limestone, chippings, gravel, tar-macadam, refined tar, manhole covers, ventilating gratings, charcoal baskets, and step irons, for the corporation.—Borough Surveyor, Guildhall, Swansea.

GRIMSBY.—February 2nd.—For the supply of whinstone macadam, slag, artificial flags, Yorkshire flags, Yorkshire kerbs, granite setts, granite kerbs and channel, pitch, coal-gas tar, Buxton quicklime, blue lias lime, dog-kennel lime, Portland cement, drainage pipes, miscellaneous brushes, scavenging brushes, drysalteries, lubricating oils, oils, paints, bottles and corks, carbolised oil, disinfectant fluid, disinfectant powder, Formalin, and Formalin tablets, for the cor-

poration.—Mr. H. Gilbert Whyatt, borough engineer and surveyor, Municipal Buildings, 170 Victoria-street, Grimsby.

ACTON.—February 3rd.—For the supply of road and sanitary requirements, and hire of steam roller, for the urban district council.—Mr. W. Hodson, clerk, Council Offices, Acton, London, W.

SALISBURY.—February 9th.—For the supply of brushes, refined tar, oils, and disinfectants, for the corporation.—City Engineer and Surveyor, Endless-street, Salisbury.

STOCKPORT.—February 7th.—For the supply of Dalbeattie and Welsh granite setts, Welsh granite, broken for macadam, Lancashire lonkey and Lancashire grit setts, flags, kerbs, granite concrete flags, Portland cement, earthenware and stoneware pipes, iron castings, pitch, creosote oil, limestone chippings and lime, for the corporation.—Mr. John Atkinson, borough surveyor, Borough Surveyor's Office, Town Hall, Stockport.

IRLAM.—February 9th.—For the supply of broken granite, tarred slag, kerbs, setts, stoneware pipes and gullies, cement, hire of steam roller, pitch and creosote oil, disinfectants, scavenging brooms, iron castings, and team labour, for the urban district council.—Mr. R. H. Winterbottom, surveyor, Council Offices, Irlam, Lancs.

HALIFAX.—February 12th.—For the supply of materials for the tramways department, for the corporation.—Tramways Engineer, Tramways Offices, Skircoat-road, Halifax.

CHELTENHAM.—February 14th.—For the supply of sacking, castings, disinfectants, electric light fittings, forage, household goods and sundries, ironmongery, indiarubber goods, lime, bricks and sand, lead pipe, sheet lead and block tin, oils, colours, Portland cement, stoneware pipes, tools, timber, wrought iron, steel and files, for the corporation.—Mr. J. S. Pickering, borough engineer, Municipal Buildings, Cheltenham.

Miscellaneous.

BANBRIDGE.—February 3rd.—For the public lighting of the urban district with gas or electricity, for the urban district council.—The Surveyor, Municipal Offices, Banbridge.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

* Accepted. † Recommended for acceptance.

HAYES.—For sewering, levelling, kerbing, paving, channelling and making good part of a street, for the urban district council.—Mr. Fred W. Pearce, surveyor:—

J. Bird, Willesden Junction, N.W.	£1,396
F. Adams, Wood Green, N.	1,315
G. Wimpey & Co., Hammersmith, W.	1,040

FORTHCOMING MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

FEBRUARY

1. Institution of Civil Engineers of Ireland: Mr. F. C. Dixon on "Recent Practice in the Purification and Softening of Public Water Supplies" 8 p.m.
2. Town Planning Institute: Prof. S. D. Adshead on "Monumental Memorials and Town Planning" 6 p.m.

TENDERS WANTED.

SWANSEA RURAL DISTRICT COUNCIL.
TO CONTRACTORS AND OTHERS

The above Council invite Tenders for the Supply of about 12,000 to 15,000 gallons of Best Quality Distilled Tar, suitable for Tar-spraying Roads.

The Tar must be supplied in barrels, and be delivered free where required at different Railway Stations in the Council's District, in such quantities as may be ordered from time to time.

Tenders endorsed "Tenders for Distilled Tar," to be sent in to the undersigned on or before Tuesday, the 6th February, 1917.

EDWARD HARRIS,
Clerk.

Rural District Council Offices,
Vetch House,
Swansea.
January 24, 1917. (3,267)

HIPPERHOLME UBBAN DISTRICT COUNCIL.
ROAD MACADAM.

The above Council invite Tenders for 2½-in. Granite Macadam.

Particulars, with Specification and Form of Tender, may be obtained at once from the Surveyor.

Tenders must be sent in not later than first post 6th February, addressed to undersigned.

The lowest or any Tender will not necessarily be accepted.

G. WHARTON THOMPSON,
Engineer and Surveyor.

Council Offices,
Hipperholme.
January 25, 1917. (3,266)

LEATHERHEAD URBAN DISTRICT COUNCIL.

The Council invite Tenders for about 400 barrels of Refined Tar for Road Tar-spraying.

The Tar to be delivered free on Rail at Leatherhead Station, and no charge on empty barrels, which will be returned at the Contractor's expense.

Also about 350 tons of Fine Grouting, suitable for covering the Tar, delivered at the Leatherhead Station.

Sealed Tenders to be delivered to the undersigned by 4 p.m. on Tuesday, 30th inst., endorsed "Tenders for ——."

The Council do not bind themselves to accept the lowest or any Tender.

SIDNEY R. DRAKE,
Surveyor.

Council Offices,
Leatherhead.
January 24, 1917. (3,265)

(Continued on p. xx.)

APPOINTMENTS OPEN.

GOSPORT AND ALVERSTOKE URBAN DISTRICT COUNCIL.

The above Council invite applications for the appointment of Engineering Fitter at their Sewage Air-compressing Station.

Applicants must be ineligible for military service.

Wages, £2 7s. 6d. per week.

List of duties and Form of Application may be obtained on application to Mr. H. Frost, Surveyor to the Council, Gosport.

Applications, accompanied by copies of two testimonials of recent date, must be sent to the undersigned not later than 12 o'clock noon on Thursday, the 8th proximo, endorsed "Engineering Fitter."

(By order)
H. R. MANGNALL,
Clerk.

Council Offices,
Gosport.
January 18, 1917. (3,257)

MERTON AND MORDEN URBAN DISTRICT COUNCIL.
TEMPORARY ROADS FOREMAN.

The above Council invites applications from persons ineligible for service in H.M. Forces for the Temporary Appointment of Roads Foreman.

Applicants must be fully qualified to superintend Works of Road Making, Paving and Sewering, have had previous experience of a Road Foreman's duties under a Local Authority, and must be cyclists.

Wages, £2 10s. and 5s. War Bonus (£2 15s.) per week.

Applications, stating age and experience, with copies of two recent testimonials, to be sent to the undersigned not later than the 5th of February, 1917, endorsed "Temporary Road Foreman."

(Signed) G. JERRAM,
Engineer and Surveyor.

Council Offices,
Kingston-road,
Merton, Surrey.
January 24, 1917. (3,262)

WANTED in the office of a Municipal Engineer in the North-West of London, a Temporary Clerical Assistant, who must be ineligible for military service. He must be competent shorthand typist, and it is desirable that the applicant should be versed in the routine work of a Municipal Engineer's Office. Salary, £3 3s. per week. Applications, with copies of testimonials only, to be sent to Box 1,602, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (3,264)

The Surveyor

And Municipal and County Engineer.

Vol. LI. FEBRUARY 2, 1917. No. 1,307.

Minutes of Proceedings.

Extraordinary Traffic: Time for Proceedings.

Among the many difficult questions connected with the subject of extraordinary traffic is that of the limitation of time within which proceedings for recovery of expenses must be commenced. Sec. 12 of the Locomotives Act, 1898, provides that the proceedings shall be commenced within twelve months of the time at which the damage has been done, or where the damage is the consequence of "any particular building contract, or work extending over a long period" not later than six months after the completion of the contract or work. The latter part of the section was no doubt intended, in cases to which it is applicable, to relieve the highway authority from the necessity of having to bring several actions for damage done by traffic conducted in connection with a single undertaking. But, unfortunately, there have been wide differences of opinion as to its application, with the result that it has probably caused quite as much litigation as it has saved. And, again unfortunately, the courts have, in some instances, shown a tendency to interpret it in a somewhat restricted sense. For instance, it has been held that the haulage of timber purchased under a series of contracts from the owners of an estate is not a "work" within the meaning of the section (*Norfolk County Council* v. *Green*, 68 J.P., 223). And where the traffic consisted of the haulage of stone under a contract to deliver such quantities as the purchasers should direct during a certain year, it was held that this was not "a particular building contract or work extending over a long period" (*Bromley Rural District Council* v. *Croydon Corporation*, 1908; 1 K.B., 353). Moreover, the question is sometimes complicated by the existence of subsidiary contracts. Thus in *Epsom Urban District Council* v. *London County Council* (1900, 2 K.B., 751) the county council entered into a contract with a firm of builders to make alterations and additions to a building, with a view to adapting it for use as a lunatic asylum, and subsequently contracted with another firm for the erection of temporary buildings for use pending the completion of the alterations. Extraordinary traffic took place in carrying out both contracts, and proceedings were commenced more than six months after the completion of the first, but within six months from the completion of the second contract, and it was held that the plaintiff council could only succeed in respect of damage caused in carrying out the latter. And in *Kent County Council* v. *Folkestone Corporation* (1905, 1 K.B., 620) the corporation were widening a road, and employed a haulier to cart stone for the purpose of the work. Damage was done by the haulage to highways repairable by the county council between January 19 and March 24, 1903, but the road widening was not completed till September following. Proceedings were commenced in February, 1904, but it was held that the county council could only recover so much of the expenses as was attributable to damage done within the preceding twelve months, or, in other words, that the haulage was a separate and distinct "work" in itself, and could not be regarded as part of the "work" of road widening. On the other hand, however, where there was a single contract for the construction of a reservoir and the laying of pipes in connection with it, and extraordinary traffic took place in connection with the latter work, it was held that proceedings commenced more than a year after the pipes were laid, but before the completion of the reservoir itself, were in time (*Carlisle Rural District Council* v. *Carlisle Corporation*, 1909; 1 K.B., 471).

Another question which has sometimes arisen is what constitutes the "completion" of a contract or work for the purpose of the time limit. Where, for instance, an engineering contract contained the usual clause providing for maintenance during a period after structural completion, it was held that the six months began to run from the date of structural completion, and not from the expiration of the period of maintenance (*Lancaster Rural District Council* v. *Fisher*, 1907; 2 K.B., 516). On the other hand, in *Reigate Rural District Council* v. *Sutton District Water Company* (73 J.P., 301) the company had contracted to construct a watertight reservoir. It was so far completed that water was let in, but it proved not to be watertight, and the company were engaged in remedying defects for another three months, and it was held that the six months did not begin to run until the defects were made good. In the present state of the law, when damage is caused in the course of carrying out works likely to extend over a lengthy period, the highway authority would be well advised to commence proceedings within twelve months from the time the damage is caused (even at the risk of having to bring further actions for subsequent damage), and not to wait until the completion of the work. It should also be remembered that when the traffic is conducted by a public authority the Public Authorities Protection Act, 1893, will apply, whether the case is one of a particular contract or work or not, and that the proceedings must in all cases be commenced within six months after the damage has been done. This Act, however, does not apply where the damage has been caused by an independent contractor, and not by the authority's own servants.

Depreciation of Plant.

The paper on the "Principles Involved in Computing the Depreciation of Plant," which was read by Messrs. Gill and Cook at a recent meeting of the Institution of Electrical Engineers,

was not confined in its interest to the immediate audience. The authors wisely dealt with their subject in a perfectly general way, with the result that they have made every branch of the engineering profession, their debtors for a most illuminating and exhaustive dissertation upon an important and complex subject. There has perhaps hitherto been a tendency on the part of engineers to regard the matter of depreciation as being one for accountants rather than themselves. It is easy to show, however, that the question is one which directly affects the engineer as such. For example, in considering extensions of plant, or the adoption of improved plant, it frequently happens that the question arises whether it is economical to take out certain plant which still satisfactorily performs its allotted function and replace it by new and more up-to-date machinery. In deciding this question it is evident that more is involved than mere accountancy or finance; indeed, the main point is one which the engineer must decide for himself, and in order to do so effectively he must have an independent grip of the financial aspect of the problem. Indeed, it may be said that, if engineering and financial considerations are divorced in settling such questions, disaster and waste will follow almost as a matter of course.

Another common error in regard to depreciation is to leave it out of the question entirely except in ascertaining how much of the proceeds resulting from the trading of an undertaking may legitimately be appropriated as profits. It is, however, of the greatest importance from the very beginning of an undertaking, and ought not to be left out of account even in preparing specification. As the authors of the paper point out, when preparing a specification for plant to achieve certain definite results, there is usually more than one way of arriving at the desired end, and skilful judgment in the selection from among the alternatives must be exercised. While the first cost of alternative plans is highly important, in most cases it is nothing like so important as the annual charges, and generally the decision as to which alternative to use can be made upon consideration of the annual charges alone. The duty of studying these costs in detail cannot be avoided by saying that the capital cost and annual charges must be minimum figures; frequently these are mutually contradictory. Thus, it may be advantageous to spend extra capital to obtain low annual charges in respect of one portion of the plant, and deliberately to incur high annual charges by reducing capital expenditure on another portion. Again, it sometimes happens that even the annual charges of the whole plant will not furnish the desired criterion, since they are not the same for each year, and in those cases they must, of course, be brought to some common time-base.

In order to understand the paper it is necessary to bear in mind the distinction that is made throughout between the *physical* life of the plant, or the period of satisfactory service as shortened by causes outside the owner's control, and its *economic* life, or the physical life as shortened by causes within the owner's control, such as desire for economy, improvement of service, or the taking out of plant because a greater capacity is required. Keeping this distinction in view, the authors conclude that there is only one common method for the engineer, the accountant, and the engineer, that this common method is best studied in the annual charges for plant determined in advance of construction, and that to determine the amount of the annual charges for depreciation it is necessary to estimate the first cost, residual values, and the physical and economic lives of the various classes of plant. The whole paper, which we are reproducing in our columns, is well worthy of close study by every engineer who is responsible for the management and maintenance of plant of any kind.

Ancient Monuments.

It is not a little refreshing in these days of turmoil to turn for a little while to such a subject as the care of ancient monuments, which was dealt with by Mr. C. R. Peers in a paper which he read at the last meeting of the Concrete Institute. Although at first sight the subject is one which seems to be a little remote from the more immediate objects of the institute, Mr. Peers was able to show by a number of very interesting examples that a knowledge of modern structural methods is very necessary in dealing with the restoration of ancient monuments. As chief inspector of ancient monuments and historic buildings to H.M. Office of Works, he was able to speak with special authority. The monuments under the charge of his department range from earthworks and megalithic monuments to seventeenth-century houses, and consequently a very wide range of treatment is necessary. In certain instances—notably the restoration of Roman walls—a knowledge of the properties of concrete is of peculiar value. Many of these walls, indeed, consist of a core of concrete mixed and thrown in between the facing courses and levelled up. The walls are solid throughout and of such strength that the cutting of holes 10 ft. and more in width right through the thickness of the wall from side to side has in no way weakened the masonry above. It is hardly fair, however, to assume from such a circumstance as this that all the work of former ages was necessarily superior to that of our own time. As Mr. Peers pointed out, there has been good and bad building in all ages, and in the course of Nature more of the bad buildings have perished than of the good, and in consequence the achievement of any period which has left an appreciable number of works is liable to be judged on too favourable a ground. The Romans were great engineers, and the mortar of such of their buildings as survive in Great Britain cannot be improved on and hardly equalled at the present day. But in the fifteen centuries which have passed since they left Britain all the inferior Roman buildings have perished, and even in those that are left there is certainly no uniform standard of merit.

A problem which is of immediate importance in connection with the care of ancient buildings is that of preventing the decay of stone; for, although injury to the surface does not necessarily affect the stability of the structure, it is disastrous so far as its history and appearance are concerned. Every student of building construction knows that this subject is surrounded with difficulty, and that no attempt to find a remedy has been completely successful. Mr. Peers disclosed the fact that a series of experiments, having for their object the discovery of a really effective treatment, instituted by the Commissioners of Works, has been in progress for some time at Edinburgh, but, though certain phenomena have been definitely established, it cannot be said that any general principle of treatment has as yet been laid down. The difficulty lies not so much in getting a preservative solution to sink into the stone as in preventing it being drawn out to the surface again in the process of crystallisation and evaporation. The care and restoration of ruins is certainly one of the most difficult tasks that can fall to the lot of an architect, and it is satisfactory to know that in this country the supervision of this work is in such capable hands.

* * *

The Proposal for Municipal Reserve Funds.

The question whether municipal bodies should be authorised to levy rates in excess of their present estimated requirements is being discussed as a war emergency measure with a special eye to the possibilities of the future. Needless to remark, there is a great deal to be said on both sides. The legal position barring

urban and rural authorities from raising money except for actual necessities is clearly reasonable and fair in so far as it limits expenditure to the needs of the moment, and acts as a healthy check to extravagance. But, it is argued, in many London boroughs, and in many provincial cities too, the war has disturbed the equilibrium of the years so that no comparison is possible with peace. Woolwich is quoted as an example of this process. There, it is stated, the building of houses for Government workers has enhanced the rateable value by £32,000, so that a 1d. rate produces far more than it ever did. Things will, of course, be altered radically after the war, but meanwhile it is obvious that what Woolwich is gaining many Metropolitan boroughs not similarly circumstanced are losing as the accidental result of the abnormal times. The case for London might be met by an extension of the scope of the equalisation of rates, but such a remedy may be dismissed as impracticable for the time being. The deterioration of the roads is instanced as one of the chief arguments for the relaxation of the rule for the limitation of expenditure to actual requirements, and here there is a fairly general opinion that something should be done to anticipate the inevitable demands upon the future financial resources of the local authorities. In many instances surpluses are accruing from the roads accounts by the fact that the depleted labour market makes it impossible to expend the amount levied for highway purposes, but in many more cases the levy has been reduced to a minimum, and the present neglect necessarily postulates an enormous future outlay to bring the roads back to their normal condition. The decision of the matter rests with the permanent officials of the Government, but a hope is expressed that Lord Rhondda, as a business man, will be able to deal with the problem in some more drastic fashion than is the habit of those gentlemen. Setting aside other requirements for the moment, it is incontestible that a strong case can be made out for an excess highway rate, which need not be oppressive at present, and the reserve from which would form a welcome accumulation for the discharge of future liabilities.

* * * *

Pigsties. In our last issue there appeared a letter from the pen of Mr. T. H. Negus, district surveyor to the Meriden Rural District Council, concerning the regulation—or absence of regulation—of the construction of pigsties. The matter is probably more urgent at the present moment than at any time hitherto, owing to the efforts that are being made to increase our home-grown food supply and to the consequent stimulus that has been given to the keeping of pigs. The only direct prohibition to be found in the Public Health Acts relates to the keeping of swine *in* any dwelling-house within an *urban* district. There is, in addition, the provision of sec. 91 (3) of the Act of 1875, that any animal so kept as to be a nuisance or injurious to health shall be deemed to be a nuisance liable to be dealt with summarily under the Act. What is required, however, is some power of effective control over the erection of pigsties, rather than to wait until a nuisance actually occurs before the local authority can step in and interfere. As Mr. Negus points out—and we entirely agree with him—the only effective measure would be to impose an obligation to submit plans for approval before pigsties are erected. Unless this be done, they are bound occasionally to be erected under a neighbour's bedroom window, or actually abutting on a highway on ground the configuration of which is such as will certainly result in a nuisance from an overflowing cesspool. We go further than this, however, and suggest that effective control can only be obtained by means of by-laws. The Board of Agriculture has already issued leaflets in regard to construction, one of which contains a model plan. These leaflets, however, have no legal force, and contain nothing more than suggestions which may be adopted or ignored at will. If their principal contents were embodied in a code of by-laws, we cannot help thinking that the result would be the avoidance of many nuisances of a peculiarly offensive type and a corresponding benefit to the public health.

* * *

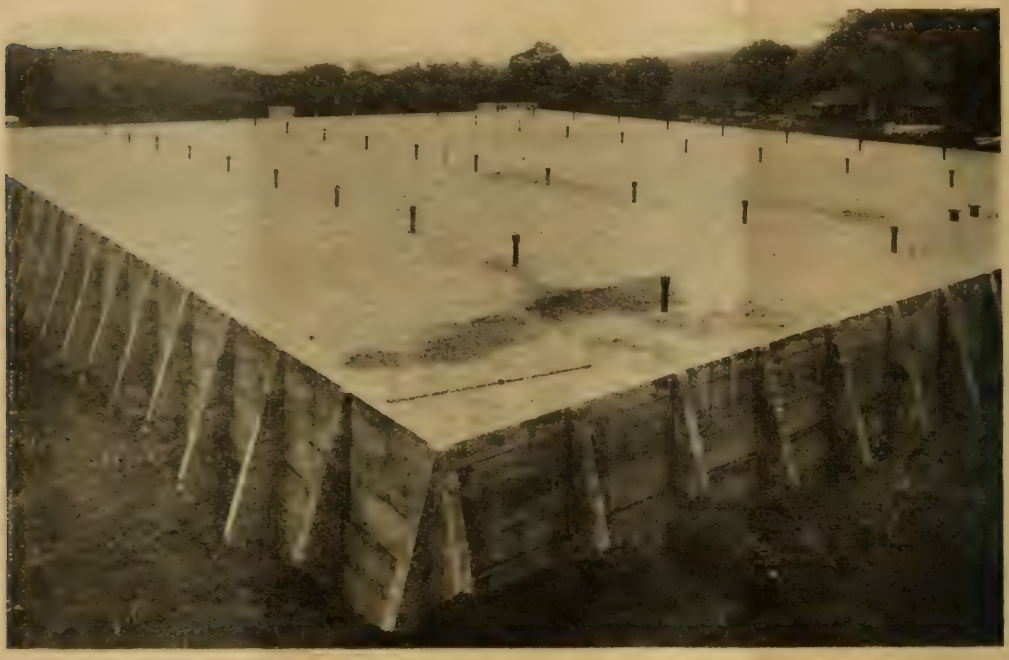
The Rights of an Inventor. The case of the *British Reinforced Concrete Engineering Company, Limited*, v. *Lind*, which was decided recently by Mr. Justice Eve, raised an interesting question as to whether an employee who is granted a patent in respect of an invention made in the course of his employment must be regarded as holding the patent in trust for his employers. The defendant was an assistant engineer in the drawing office of the plaintiff company, and his duties included the investigation of inquiries relating to reinforced-concrete constructional work, the preparation of plans, and the designing of the best method of carrying out the work. In the course of these duties he designed a form of reinforced-concrete block for lining the headings of mines, for which he subsequently obtained letters patent. In these circumstances the plaintiff company claimed a declaration that the invention was their sole property, and that the defendant held it as trustee for them. It appears from the judgment that the real question in a case of this kind is whether it is inconsistent with the good faith which ought properly to be inferred or implied as an obligation arising from the contract of service, that the servant should hold the patent otherwise than as trustee for his employer. The answer to this question must depend to some extent on the terms of the contract of service in any given case. In the particular case under discussion the learned judge thought that the terms of the defendant's employment obliged him to place the best design he could at the disposal of the company, and that it was inconsistent with this obligation that he should be allowed to retain the patent for his own benefit.

* * *

Street Architecture. The correspondence which has been going on in the columns of our contemporary the *Birmingham Daily Post* on the subject of street architecture has culminated in a definite and interesting suggestion by Mr. Herbert Buckland. This is none other than that a "Committee of Taste" should be appointed consisting of two members to be nominated by the city council, together with a number of artists and architects. The functions of the proposed committee would be strictly limited to matters directly connected with design in relation to harmony with surroundings, and it is not suggested that it should interfere in any way in the administration of building by-laws by the city council. Mr. Buckland points out that a really energetic adverse criticism of any architect's design would probably in itself cause him furiously to think, and in some cases obviate the necessity for the exercise of the powers conferred on the committee. This is by no means the first time that it has been suggested that the ordinary functions of a local authority with regard to buildings should be supplemented (or superseded) by an outside body. The present proposal, however, has this merit at least, that the proposed committee will only deal with matters of art and taste, and that the suggestion for its constitution is made without any reflection upon the work of the city council as regards the administration of by-laws. It will be interesting to observe what comments (if any) the city council have to make on Mr. Buckland's proposal.

The Stella Reservoir, Durban.

Durban is a very up-to-date town, and is noted for its splendid institutions, included among which is its water supply, which is most probably equal to that of any town of its size in the world. The climate is



THE STELLA RESERVOIR, DURBAN.

sub-tropical, and therefore a larger amount of water is consumed than in colder countries, the daily consumption averaging 6,000,000 gallons.

adequate emergency reserve connected up to the above main. It was decided that this object should be attained by the construction of a large covered-in reservoir, placed at such a level as would necessitate only a minimum amount of pumping to the higher portions of the town.

The site chosen is situated in the virgin bush, which

THE STELLA RESERVOIR IN COURSE OF ERECTION.

Owing to the increase in the size of the town it became necessary to augment the supply, and 8½ miles of 20-in. steel main were laid from the filter beds to the borough. It also became necessary to provide

is gradually being cleared away, the land being sold to supply the demands of residential requirements.

The next consideration was as to the best material with which to construct the reservoir.

Brick was considered, but it was found to work out far too expensive on account of the thick walls that would be required to withstand the pressures brought to bear against them. Not only this, but also the limited life of a brick-constructed reservoir played an important part in the abandonment of this material. On reinforced concrete being considered, it was proved to be more economical in every respect. An estimate of the cost of the reinforced concrete work was prepared, and it was decided to carry out the work by the borough engineer's department.

The foundation is good solid ant-heap, and the floor is constructed of 9-in. concrete, 9 in. thick, strengthened with reinforcement, and doubly reinforced under the columns and walls. This floor, comprising an area of approximately 3,500 sq. yds., was laid in one continuous operation by means of night-and-day shifts, anchor and bars, upon which to fix the reinforcement for walls and columns, being inserted into the floor.

The eighty columns to carry the roof were next constructed, they being 10¼ in. by 10¼ in., reinforced with four bars vertically with horizontal bindings at 10-in. centres.

The walls consist of a slab 9 in. thick at the bottom, breaking back 3 in. half way up, and carried 6 in. thick to the top. They are doubly reinforced with bars horizontally at 12-in. centres, and vertically at 20-in. centres, with buttresses at 7'6-in. centres, also reinforced both ways. The walls thus constructed were designed to withstand the whole of the earth pressures with the reservoir empty, and the water pressures when full, not taking into account the counteracting pressures from the earth filling. By this means a very substantial wall was obtained.

The roof consists of a 4-in. slab of concrete, reinforced with bars at 12-in. centres and temperature bars at 20-in. centres between the secondary beams. Inserted bars were also used over the tops of each main and secondary beam.

The main beams are placed at 15-ft. centres, and are 20 in. deep by 12 in. wide, and the secondary beams are 16 in. by 8 in. at 5-ft. centres.

This roof is designed to carry a load of 12 in. of covering soil, plus the usual allowance for accidental loads.

The internal dimensions of the reservoir are 165 ft. by 150 ft., and it is of such a depth as will allow of 13'6-in. head of water and a clearing of 3 in. under main beams. The reservoir is subdivided by means of a partition wall, and provision is made for independent service from each, thus giving every facility for cleaning purposes without in any way affecting the supply.

The capacity of each tank is approximately 1,000,000 gallons, and each is ventilated with twenty-two ventilators.

Automatic valves are used for regulating the level of the water, and recorders are fixed to each tank.

The work cost approximately £11,000, and it was undertaken when building materials were at high figures owing to the war.

As previously mentioned, the whole of the work was carried out departmentally by Mr. W. O. Roberts, the resident engineer of waterworks.

The Kahn system of reinforcement used on the work (Trussed Concrete Steel Company, Limited, Caxton House, Westminster), was supplied by Messrs. Hansford & Hansford, of Durban.

Recovery of Fats from House Refuse.—Manchester Corporation is asking all householders to keep their scraps separate from house refuse, and is collecting them and having them degreased for the purpose of obtaining fat for soap boiling and munition purposes. The residue is used for animal food.

Gas Consumption at Manchester.—The consumption of gas at Manchester, in the nine months ended December 31st last, shows a decrease of 157,399,000 cub. ft., which on being analysed shows an increase of 1·60 per cent in the day consumption (*i.e.*, 8 a.m. to 4 p.m.) and a decrease of 9·89 per cent in the night consumption, or a nett decrease of 3·69 per cent over the corresponding period of 1915. This decrease is mainly attributable to the operation of the various restricted lighting orders which have been in force during the period under review. The Summer Time Act has also affected the consumption to a considerable extent (6·53 per cent for the summer-time period).

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Now that the very representative committees of the "Safety First" Campaign Council have been formed, and have got to work, is it not to be hoped that one of the first "reforms" which will be tackled will be that of the utterly unscientific methods adopted for darkening the London streets?

* * * *

Touching street lighting, cannot some of us remember, when Euston-road was originally lighted with high central standard arc lamps of somewhat intense power, there was a general outcry among drivers that the black shadows cast at the side of and behind vehicles made driving very dangerous? Is not this always to be guarded against when arranging for street lighting, and is it sufficiently studied when arranging the position of the lamps?

* * * *

Have not some councillors the most extraordinary ideas of the duties of their surveyor? Was it not delightful to read the other day of a committee of a certain rural district council bringing up a report as to the future duties of their surveyor, in which, *inter alia*, they suggested "that on his rounds of inspection he should carry a spade with him in order that he might be able to clear any archway he found blocked to let water off the roads, or similar useful work"? Is not that touch about any "archway" too delicious, and is not the phrasing of the whole paragraph quite "too too" for words?

* *

Could we not do something in memory of that brave man and great explorer Captain Selous? Were we not struck by his brother's letter to the *Times* the other day, in which he pointed out how greatly the late Captain Selous appreciated the fact that the road in Mashonaland which he had cleared of the tsetse-fly in 1890 had been called Selous-road? Would it not be a graceful act on the part of this country if we could still further perpetuate the memory of this great man by naming some important new road after him?

* * * *

Was it not rather amusing to read in the *Nottingham Guardian* of January 10th that a local registrar of births [who had fallen foul of the Registrar-General], in sending in his resignation to the district council, finished his letter by saying, "I refuse to go to Long Bennington, and the Registrar-General can go to heaven"? Did he really mean heaven? As the council did not accept the resignation, but decided to write to the Registrar-General, would it not be interesting to know where they addressed the letter?

* * * *

Why should the Corporation of Manchester go to the expense of issuing to the scholars on the school registers 120,000 circulars appealing to citizens to clear away the snow when they refuse to engage women to assist in street cleansing? What is the reason that both the Corporations of Manchester and Salford steadfastly refuse to employ women for street cleansing when other large centres have found the employment of women for this purpose so successful? Is the Manchester mud considered to be too pronounced to give way to the efforts of the "gentler" sex?

* *

Why is it that after an external explosion the glass of the windows falls outwards into the street; and not inwards on to the floors of the buildings? Is it because the first action of the pressure of the air tends to compress the air in a room, which is immediately followed by a partial vacuum of the air outside, thus reducing the external pressure, so that the compressed air in the room breaks the windows in order to escape and regain equilibrium? If this is not the correct solution will some reader give the true scientific explanation?

*

When the question of the investment of a balance of £1,000 was under consideration, was it not rather a strange argument of a member of the Norton, Yorks, Rural District Council when he said that if they made this investment "future generations would benefit at the expense of the present ratepayers, and that the balance ought to be applied to the reduction of the rates"? Does it not seem almost incredible that such a statement could have been made, and is it surprising to read that the council unanimously voted for the sound policy of investing the money? Also that the chairman administered a dignified rebuke to the short-sighted councillor?

Principles Involved in Computing the Depreciation of Plant.*

By F. GILL and W. W. COOK, M.M.I.E.E.

It is not very satisfactory that engineers should hold such divergent views on so important a question as depreciation.

Possibly this is due to the subject being regarded as one for the accountant alone, but in our view depreciation concerns the engineer, the financier, and the accountant, and no one of the three is competent to settle the question in any particular case, as, in order to obtain correct results, there must be co-operation between the three.

While this is true in the application of the principles of it is also true that each of the three parties concerned must study the question in all its bearings, and it is just as important that the engineer should understand the financial aspect as it is for the others to follow the engineer's methods in his share of the work.

The depreciation component of cost is very often a dominating one, and it is surely illogical to leave this matter in its present unsatisfactory position while devoting time and money to investigating questions which have far less effect on the total cost.

We can discover no reason why there should not be general agreement on this question; it is so largely a question of fact, and because it is possible to demonstrate the correctness or otherwise of any system, there seems no justification for resorting to mere assertion and appeal to authority in support of any particular theory.

There is no difference of opinion as to the importance of the subject and the necessity for making some provision for depreciation. All plant has a limited life; at the end of its life it is worth nothing, except the value of the material as scrap, and it is clear that, from the moment it is first brought into use to the end of its life, a process of diminution in value is going on continuously.

Although much has been written on this subject, the only points on which all the writers are agreed are that:—

(a) The matter is one of great importance.

(b) The term "depreciation" is loosely employed, and has various meanings.

A good deal of trouble has been caused by not strictly defining the scope of the subject under discussion, and misunderstandings may be avoided in the present instance if it is made clear at the outset that by the term "depreciation" is intended to be covered: (1) Provision for the diminution in value of plant in place and working (that is, its loss in value to the owner as a continuing plant), by reason of causes *outside* his control, such as age, wear, and accidents; this provision is hereinafter called "renewals." (2) Provision to enable the owner to take plant out of commission before its physical life is exhausted in cases where, from either progress of the art or growth of the business, it is economically advisable to do so (that is, by reason of causes *within* his control); this provision is hereinafter called "improvements."

It should be noted that the expression "renewals" denotes provision in respect of actual expired capital outlay, while the expression "improvements" denotes provision to create plant to be destroyed while still workable.

Nothing is further from our minds than any setting up of standard rates of depreciation for all plant or for any section of plant. There must always be differences in conditions, and it is unlikely that any standard rates can be devised to serve all conditions.

While saying this, however, it must be made plain that the principles upon which depreciation is calculated remain the same, though the application of these principles may lead under different conditions to widely varying results.

We propose first to discuss the principles which govern the question primarily from the engineer's point of view, and it is hoped that if this be successfully accomplished it will be found to lead naturally to the financier's and the accountant's view points also.

The function of the engineer in this matter is to provide the information necessary regarding the plant, such as first cost, residual value, and life.

The function of the financier is to provide information regarding the money, the amount available, the rate at which it can be borrowed, and the rate that can be obtained for the loan of it.

The function of the accountant is to provide accurate records based on the decisions arrived at, and to see that the real results are neither disguised nor hidden.

All three must come to a common decision, and each in any calculations he has to make must work to it, otherwise nothing but chaos can result.

Generally, depreciation seems to have been regarded as almost entirely an accountant's question, to be brought into discussion only when desiring to ascertain how much of the proceeds resulting from the trading of an undertaking may be appropriated as profits. But depreciation is very important long before this stage is reached, and it is because of the great difference in opinion between engineers themselves, as well as between them and financiers and accountants, that this paper is written, in the hope that some agreement, or at any rate some clear views of the different opinions held, will emerge from the discussion.

Depreciation as Affecting the Design of Plant.

When preparing a specification for plant to achieve certain definite results, there is usually more than one way of arriving at the desired end, and skilful judgment in the selection from among the alternatives must be exercised.

While the first cost* of alternative plans is highly important, in most cases it is nothing like so important as the annual charges, and generally the decision as to which alternative to use can be made upon consideration of the annual charges alone.

One cannot escape the duty of studying these costs in detail by saying that the capital cost and annual charges must be minimum figures; frequently these are mutually contradictory.

It may be advantageous to spend extra capital to obtain low annual charges in respect of one portion of the plant, and deliberately to incur high annual charges by reducing capital expenditure on another portion.

Again, it sometimes happens that even the annual charges of the whole plant will not furnish the desired criterion, since they are not the same for each year, and in those cases they must, of course, be brought to some common time-base.

Annual Charges.

Annual charges are composed of four principal parts:—

(1) Return on capital outlay, treated as a charge, because no engineer, unless in special circumstances, is justified in putting down plant which will not pay a return on its own capital. Even in cases where a return on the outlay is not looked for, the nominal interest is a measure of the burden.

(2) Depreciation—as already defined.

(3) Maintenance, the cost of keeping the plant in as good condition as is desirable, but not of renewing it.

(4) Operation—the cost of working the plant.

The first three enter into the annual charges of all plant; the fourth does not. For example, a boiler or a tramcar requires to be operated before it can perform its function, but this does not apply to a pole.

Assume a situation in which there is as yet no plant installed and let there be two alternative ways of achieving the results required, A and B as below:—

	Alternative A. First cost, £15,000.	Alternative B. First cost, £15,000.
Annual charges—		
Return on capital	£500	£750
Depreciation	600	450
Maintenance	500	300
Operation	900	600
	£2,500	£2,100

Annual charges for A—£2,500.
Annual charges for B—£2,100.

* Paper read at meeting of the Institution of Electrical Engineers, [illegible].

* The expression "first cost" is intended to mean any or all of the following as the context requires: (a) the original construction cost; (b) the estimated original construction cost; (c) the estimated construction cost to replace the plant new.

It is evident here that, although alternative B requires more capital, it is worth while to expend the greater sum, because the annual charges are less, so that either a reduced sum can be asked for the product, or, since the results achieved are the same, the cash for the product can be the same, and an excess profit made.

At this stage it is desirable to insist upon the importance of the utmost accuracy in the preparation of the annual charges. There is still a great deal to be done in accumulating data regarding these, but so far as is possible they must be accurately founded. When it is remembered that the purpose for which they are required is to enable the engineer by their means to select plant wisely, and so to plan economically, it will be acknowledged that he must use his best endeavours to arrive at annual charges which are as correct in every possible way as he can make them.

If the cost of any plant is to be judged by its annual charges, they must be the true annual charges, and one cannot express these by the single statement that they are, say, 14 per cent per annum of first cost, unless either the cost is uniform each year, or the rate mentioned is an equated rate taken over the prospective life of the plant.

With reference to uniformity :—

Return on Capital.—The amount will be uniform if the capital has not been written down—that is, if the sums put aside for depreciation are kept in a separate fund until the sum that is required has been accumulated. If, on the other hand, part of the capital is paid off each year, the sum for return will decrease each year.

Depreciation.—Here, again, the amount required will vary according to the method of making provision and to the treatment of the capital account.

Maintenance.—For the present, let it be assumed that this is constant each year. This point will be returned to later.

Operation.—This is also taken as constant.

It is seen, then, that the sums required for return on capital and depreciation both depend upon the treatment of the capital account and the depreciation fund; in fact, these two are so intimately connected that their costs cannot be treated independently.

LIVES, PHYSICAL AND ECONOMIC.

For the purpose of this paper there are two lives which must be defined :—

(*a*) Physical life—that is, the period during which the plant would continue to perform satisfactorily the service to which it is adapted, if allowed to do so, but subject to all causes *outside* the control of the owner, such as wear and tear or accidents.

(*b*) Economic life—that is, the period of physical life shortened by causes *within* the owner's control, such as desire for economy, improvement of service, the taking out of plant because a greater capacity is required.

It is necessary to distinguish quite clearly between these two. The physical life affects the amount to be put aside each year for renewals, and, since by definition the plant can perform its service satisfactorily during the whole time, there is no compulsion to renew before the conclusion of the physical life.

The renewals fund thus ensures that the money invested in plant is always represented by the assets, provided that none of it is voluntarily destroyed.

In the conduct of a business, however, it is often desirable, in the interests of shareholders and consumers alike, to take plant out of commission before the end of its physical life, either because more economical plant is available or because it is no longer capable of meeting new developments of the business.

Since the main cause for these changes is economy, it may be argued that the cost of making them should be defrayed by new capital; but this is not always available, and if this course were adopted the new capital would not be represented by assets until the new plant had earned enough extra profit to pay for the wastage.

In order that the owner of the plant may be always in a position to take advantage of developments, and still be in a sound position, it is necessary to have a special fund available for the purpose, and such a fund is referred to in this paper as the improvements fund.

As such a fund is necessary for the successful conduct and progress of the business, the annual contributions are, in a continuing business, part of the annual charges against the plant.

The distinction between the renewals fund and the improvements fund must constantly be borne in mind.

The charges to the renewals fund represent actual expired capital outlay each year, and consequently are the measure of the diminution of the value of the plant in place considered as a structure, while the improvements fund enables plant to be superseded before its physical life is ended, and ensures that when this is done the value of the assets shall always represent the invested capital.

In a change of ownership where it is a condition that the purchaser should take over the plant as a structure, and the valuation is to be on the basis of physical life, any balance which stands to the credit of the improvements fund represents a reserve out of profits which has not been required and belongs to the seller, but if the business is purchased as a going concern, the desirability of superseding plant in the near future may be one of the factors determining the price, in which case it will be necessary to bring the improvements fund into account.

METHOD OF ARRIVING AT PROVISION FOR RENEWALS AND IMPROVEMENTS.

Looking first at renewals, what change has occurred in plant which causes it to diminish in value from 100 per cent when it is new to, say, 10 per cent at the end of its physical life?

If one takes one of the simplest possible structures, a creosoted telephone pole, and examines it, say, five years after erection, one cannot say positively that either its weight or strength is less, as there is no perceptible decay in most cases, nor can one say that it is earning less, as it will frequently be earning a larger sum per annum than at first because carrying more wires.

In fact, the only solid ground for saying its value has decreased is that it is five years nearer to the end of its life, and the question is how to find the diminution in value caused by the passage of these five years.

The methods of arriving at the deduction to be made for any plant which has already been in existence some time may be divided into two classes :—

(*a*) Based on a detailed examination of the plant and an individual assessment of values for each item.

(*b*) Based on an estimated life which the various classes of plant will have under a given standard of maintenance, and providing for the diminution in value by writing off or setting aside a proper sum in respect of each expired year (or other portion) of life.

When carefully examined there is really no sharp dividing line between these two methods.

In the case of detailed examination (*a*), proper weight can be given to condition, but physical examination alone will not enable a proper deduction to be made for the depreciated state of the plant. In some cases, for some years, the plant shows no sign of wear or decay, yet obviously some provision ought to be made for the expired life during these years.

It is usual, therefore, and necessary, to estimate the first cost, life, age, and residual value.

If individual items of plant are dealt with, the life and sometimes the age can only be judged very approximately.

If, as in method (*b*), the bulk is considered instead of the individual items, the life and age can be estimated with much greater certainty, while consideration of the amount spent on repairs and upkeep, supplemented by inspection, will give the condition.

While expert examination has a proper and most useful sphere in all cases, and is almost essential in determining the economic life, there is no means whereby one can examine plant and by that examination alone estimate what is the value remaining in the plant in place; some method of computation must be adopted.

The measurement of the effects of wear and tear and the passage of time is essentially a financial operation, and no satisfactory solution can be found without going through the steps of establishing the first cost, residual value, life, and age.

It is often said that one cannot say how long a certain plant will last; but this is not a sufficient answer. One must estimate the life if there is to be any attempt towards scientific treatment in planning.

One cannot neglect capital charges—*i.e.*, return on capital and provision for depreciation; and the latter depends very largely upon life.

Those who say the life cannot be estimated, and take, say, 10 per cent as capital charges, do, in fact, estimate the life, though they do not state the period, and they do so without taking the necessary precautions to estimate it correctly, because for any particular rate of return on money and with a given

residual value, 10 per cent per annum can only be arrived at by one definite life.

Further, without estimates of lives one cannot logically arrive at one common rate for capital charges for various classes of plant capable of living for various periods. It follows, therefore, that of necessity estimates of life must be made.

In the case under discussion, no plant has yet been constructed, so that an examination of the actual conditions is impossible in forecasting the annual charges.

Having discussed the questions of physical and economic lives, it seems advisable to turn first to the method of treating the provision for the capital portions of annual charges based on the economic life, and afterwards to the proportion chargeable to renewals and the calculation of the value of plant in place, based on the physical life.

Most of the examples in the paper which concern economic life have been worked out on a basis of :—

First cost	£100
Residual value	13 per cent
Economic life	19 years

and the examples which concern physical life on a basis of :—

First cost	£100
Residual value	2 per cent
Physical life	25 years

In both cases interest where taken is at 5 per cent per annum. The tables are merely illustrative, and the principles involved are as easily discussed on these figures as on any other, and there is some advantage to be gained by keeping the tables for economic and physical lives quite distinct in the discussion.

We suggest that it will be an advantage if those contributing other tables will, unless there are reasons to the contrary, use the same figures.

In discussing these principles the aim is to ascertain as precisely as possible the proper annual charge against each unit of plant for each year of its life, and thus each unit of plant may be considered as a person who takes service from a public utility company under the condition that he is to be charged a proper rental, which shall be exactly sufficient to safeguard the company against all proper charges and give a stated return on the capital employed.

Let the essential conditions be that the plant (or person) shall be charged with a yearly sum sufficient to :—

(1) Pay for all maintenance.

(2) Pay all operating expenses.

(3) At the end of the physical life renew the capital outlay on it.

(4) Provide sufficient money to enable the company to take advantage of improvements in the art, and take out of commission, when desirable, plant which still has some years of life left in it.

(5) Pay the company an agreed return on the money invested, say 5 per cent per annum.

(6) Let it be also assumed that the capital is £100, and that it and the plant do not increase during the whole time.

The problem then is to find how much should the plant or person contribute each year :—

(1) *Maintenance.*—For the moment this charge is assumed to remain constant, and can therefore be neglected.

(2) *Operating.*—This is assumed to remain constant, and can also be neglected.

(3) (4) *Renewals and Improvements.*—These involve the question of life and residual value. Assume the economic life is agreed at nineteen years, and that the residual value at the end of the life is 13 per cent of the first cost, after paying for cost of recovery.

(5) *Return on Capital.*—This needs no discussion.

(6) *Fixed Capital and Plant.*—This is assumed, so that a steady base may be taken throughout.

It must also be laid down what is to be done with the money received each year in advance for renewals and improvements. Everyone agrees it cannot remain idle. It cannot be invested in the business, because by hypothesis (6) the size of the plant and the amount of the capital account are fixed; it must therefore be used to repay the capital gradually or be lent at interest to someone outside the business. Assume that in the latter case it obtains the same rate as that which is agreed upon for return on capital, say 5 per cent per annum.

Since the matter can be treated in different ways it is necessary to consider what tests shall be required of the various methods. There are two: (1) The total cost of all the annual charges for the economic life of the plant shall not exceed the real cost; and (2) the incidence of the annual charges shall not be such as to cause anomalies in the conduct of the business in different years or periods, unless such incidence is due to some plant condition.

In the typical methods to be examined it is assumed that the first cost is £100, the residual value at the end of the economic life £13, and the economic life nineteen years. The total cost is therefore the return on the invested capital during the nineteen years, and £87 at the end of the nineteenth year. The simplest way to assess the whole transaction is to take the present value of all payments, and, using the assumed

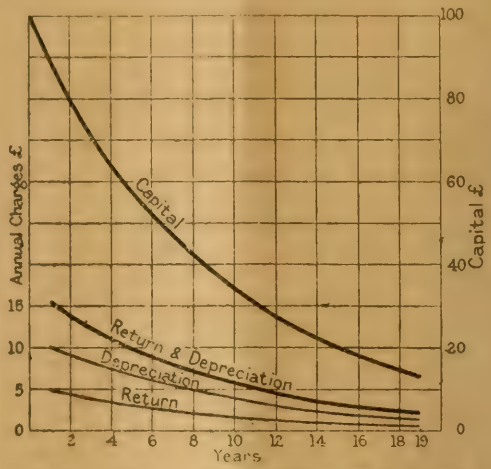


Fig. 1.—Annual Charges: Reducing Balance Method.

rate of interest—5 per cent per annum—it is found, apart from any particular method, that what is required is :—

The present value of nineteen annual payments, of £5 each, for return on capital of £100 = 5 × 12·08532	=	£60·43
The present value of £87 required nineteen years hence = 87 × 0·39573	=	34·43
		£94·86

This present value, £94·86, is then the total cost, independent of any method, to be used in the first test of any method.

There are various methods of treating the provision for depreciation, but substantially they reduce to the following :—

(1) Maintenance method, wherein no regular sum is put aside, the plant being maintained and renewed out of revenue expenditure.

(2) Reducing balance method, wherein a uniform percentage is deducted each year off the reduced capital cost.

(3) That usually called the straight-line method, wherein the annual charge is the ratio of one year to the total time or life.

(4) Sinking fund or annuity method, wherein value is given to the interest the fund will earn until it is wanted.

(1) The maintenance method affords no means of calculation; it is bound to be irregular, and, since no charge can be made until a renewal actually takes place, the method is always in arrear unless and until a complete renewal is effected.

(2) The reducing balance method is very frequently employed to ascertain the amount to be allocated for depreciation at the end of a year. The first cost being assumed at £100, the residual value 13 per cent, the economic life at nineteen years, it will be necessary to apply a rate of 10·18 per cent per annum to the reduced balance to extinguish the £87 during the life, and the costs for return and depreciation are shown in Fig. 1.

This method results in a relatively heavy charge in the early years, and a very light one in the last years. The present value of the whole series of payments is £91·86, and so this method satisfies the check as to total cost; there only remains the check on incidence.

(3) The straight line method has been strongly advocated, and requires extended consideration.

Assuming the same case as before (first cost, £100; residual value, £13; economic life, nineteen years), £87 is required in nineteen years for renewal of plant or redemption of capital.

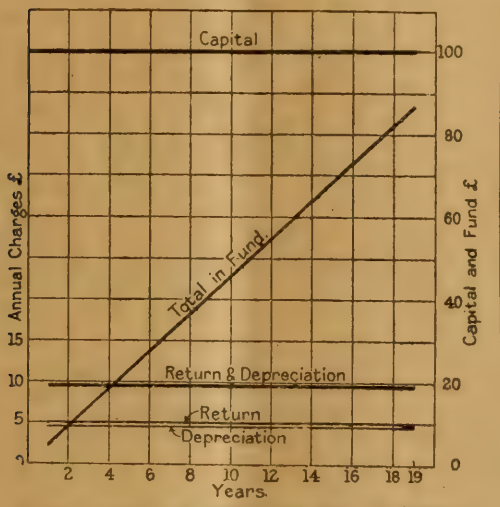

FIG. 2.—ANNUAL CHARGES: STRAIGHT-LINE METHOD AS FREQUENTLY POSED.

The straight-line method, as usually posed, is simplicity itself. Eighty-seven pounds is to be found in nineteen years; therefore, all that is required is £4·58 per annum for depreciation, and, with £5 for return, the total charges for these two heads are £9·58 per annum, as shown in Fig. 2.

This table does not, however, pass the test of total cost; the present value of nineteen annual payments of £9·58 each at 5 per cent is £115·77, instead of £94·86, an excess of £20·91.

If £4·58 be set aside annually, there will, of course, be £87 accumulated at the end of the nineteen years; but since it is not prudent to leave money idle, it is plain that interest ought to be, and will be, earned by the money so set aside annually.

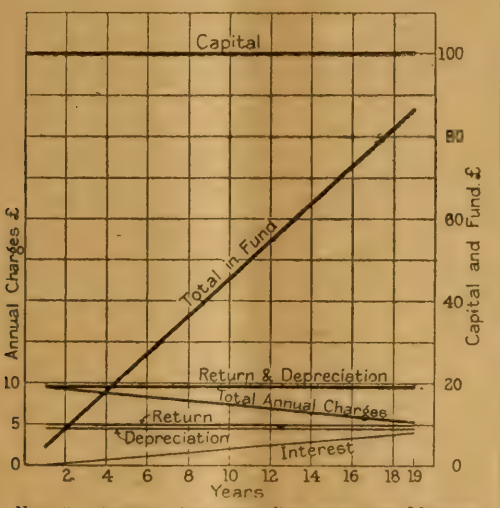

FIG. 3.—ANNUAL CHARGES: STRAIGHT-LINE METHOD IN PRACTICE.

If interest is taken at 5 per cent per annum and added to the growing fund, there will be at the end of the nineteen years not the £87 required, but £139·84, so the yearly payments must be reduced below £4·58 per annum until the amount is just sufficient to accumulate only the £87 required, and this needs a yearly payment of £2·85 for the nineteen years.

If the earned interest be not added to the fund, but credited to the general revenue account, as is generally the practice of those who uphold the straight line method, the effect is that the revenue is increased thereby, with the result that a higher return on the capital is obtained, the interest earned by the depreciation fund not being required for the plant. But this is a violation of the hypothesis, because a stated return on capital was to be earned, no more and no less.

This case is shown in Fig. 3. Here, again, the present value of all the payments exacted for the plant is too great, being £115·77.

If the straight line law is followed, but instead of accumulating a fund the capital is partly repaid each year, the present value is seen to be correct at £94·86, and there remains the question of incidence. Fig. 4 shows this.

(4) Annuity method. Fig. 5 shows the same case treated as an annuity, by which each year a part of the capital is repaid, and a return is paid on the capital outstanding.

Here the total annual charge is uniform at £7·85 per annum, made up of the decreasing return component and an increasing depreciation component. At the end of the life all the capital has been repaid, except

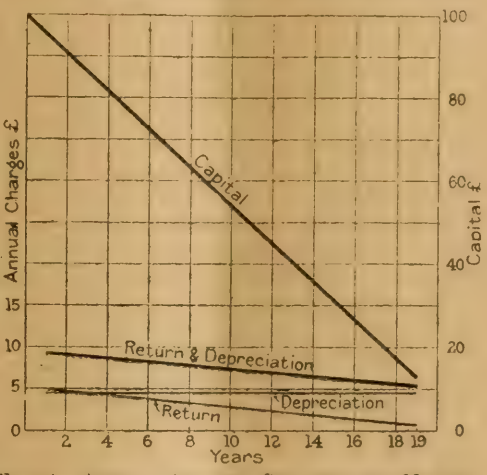

FIG. 4.—ANNUAL CHARGES: STRAIGHT-LINE METHOD. PART OF CAPITAL REPAID EACH YEAR.

£13, which will be found by the sale of the plant. The plant (or consumer) gets the benefit of interest, because as capital is repaid the return thereon ceases. The present value of the series of payments is £94·86.

(4) Sinking fund method. Fig. 6 shows the case treated by a sinking fund. In this instance the capital remains fixed at £100, and a fund is built up gradually against the end of life, at which time, and not until then, the money will be required either to repay the capital or to replace the plant.

Here the total annual charge is uniform at £7·85

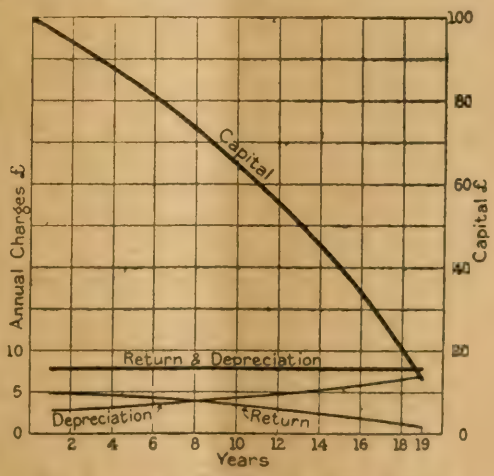

FIG. 5.—ANNUAL CHARGES: ANNUITY METHOD.

per annum, made up of uniform charges each year both for return and for depreciation. The present value of the series of payments is £94·86.

The depreciation fund is not required until the end of the life, and, of course, earns interest in the meanwhile; this interest is earned by the money contri-

levied by the plant (or person), and must somehow be credited to its source. In this instance the interest is added to the fund, and because of that addition the annual charges are reduced.

The advocates of the straight-line method have to choose between Figs. 2, 3, and 4.

They cannot adopt Fig. 2, because that requires either that no interest is earned by the money paid annually in advance, or that interest is earned but not disclosed, each being an untenable position.

They cannot adopt Fig. 3, because that requires the plant (or person) to pay an enhanced annual charge under the plea of it being required to provide for depreciation, although as a matter of fact the enhancement is used to give the owner a greater return.

They are not likely to adopt Fig. 4, because that requires a charge which reduces each year till the end of the life of each portion of plant, and then

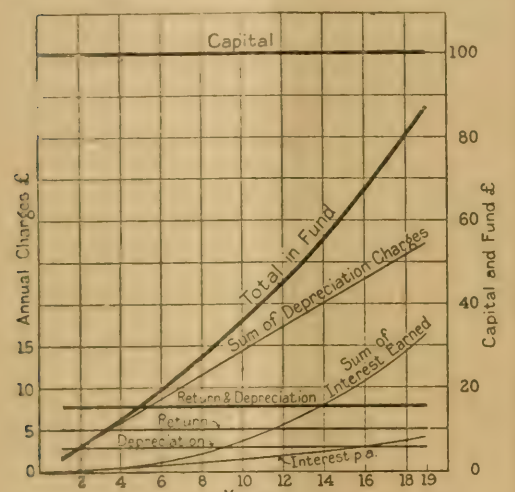

Fig. 6.—Annual Charges: Sinking Fund Method.

increases and again commences to fall. It would be impracticable to base any rates on this table.

Tabulating the present values of the whole transaction by the various methods we have Table I.

Table I.

Present value of the Annual Charges for 19 years by the various methods shown.

Method	Table No.	Figure No.	Annual charges	Present value
			£	£
Real requirements	—	—	94·86	
Reducing balance	1	1	15·18 to 2·9	94·86
Straight line as frequently posed	2	2	9·58	115·77
Straight line in practice	3	3	9·58	115·77
Straight line if proportion of capital is repaid each year	4	4	9·58 to 5·96	94·86
Annuity	5	5	7·85	94·86
Sinking fund	6	6	7·85	94·86

Now it is obvious that each method produces exactly the required present value, except that which takes up the position that interest will not be earned on the money received each year and in advance of being required, or while admitting that interest will be earned does not credit it to its source.

Examining the methods shown in 1, 4, 5, and 6, each of which has a present value of £94·86, for the test of incidence, 1 and 4 require an annual charge with varies each year, while 5 and 6 have charges which are already each year.

There is no condition as regards the plant which requires this varying annual charge, and certainly no plant condition which would enable one to distinguish between the varying annual charges in 1 and 4.

If there are some real reasons for varying annual charges, it seems they must be faced, but if they are existing it is useless to consider a forecast of annual charges with a varying scale.

The reducing balance method (No. 1) is seen to be one of convenience and not of fact, because if it were really correct that the annual charges vary in such a marked fashion—*e.g.*, first year, 15·18 per cent; sixth year, 8·87 per cent; twelfth year, 4·66 per cent—then either there must be some counterbalancing increasing cost, or the charge to a consumer for the use of the plant would require to be a reducing one.

There is no such reducing charge in practice; consequently, if the steady charge to the consumer is sufficient to give a return of 5 per cent in the first year, then the same charge will give 15·8 per cent return in the sixth year, 39·3 per cent in the twelfth year, and 94·8 per cent in the nineteenth year.

The same reasoning applies to the method shown in 4. In ordinary practice there is no such reducing charge, except in book-keeping, and that has its foundation in convenience or prudence, and not in the actual requirements of the plant.

On the other hand, both the annuity and sinking fund methods are correct in amount, satisfy all real requirements demanded by the plant, and, being uniform, can be easily handled. In practice it is not usual to repay the capital fractionally each year—the money set aside for depreciation is generally accumulated until wanted, and the sinking fund method satisfies all conditions of the problem so far.

(To be continued.)

COUNTRY ROADS BOARD OF VICTORIA.

THIRD ANNUAL REPORT.

When the Country Roads Board of Victoria, Australia—the chairman of which is Mr. W. Calder, M.Inst.C.E.—entered upon the third year of its operations, it was hoped that the work of constructing and improving the system of main and developmental roads would have proceeded uninterruptedly during the year. This hope, however, was not realised.

The difficulties experienced by contractors employing a large number of horses continued throughout the first half of the year, owing to the high cost of fodder. In addition, owing to many of the most suitable type of men for road works having enlisted for active service, contractors had great difficulty in keeping their plant fully occupied, and in expediting the completion of their contracts, with the result that many contracts were not finished until long after the specified time.

In rural districts, owing to enlistment by large numbers of countrymen, and to the fact that a record harvest was assured, there was considerable anxiety as to whether sufficient labour would be available for harvesting operations.

It also became evident that, apart from the necessity for releasing as much labour as possible for gathering the harvest, there was a considerable increase in the cost of team and manual labour required for road works, in addition to the increase caused by the war in the cost of materials, such as cement and steel, required for bridges and culverts.

Owing to these circumstances, together with the unsettled financial conditions consequent on the war, it was decided by the Government that works for which contracts had already been entered into should be completed, but that the letting of new contracts for permanent works should be discontinued by the board after October 31, 1915, until a return to normal conditions. In the meantime the roads were to be kept in a trafficable condition by means of expenditure of maintenance funds, even if an increased expenditure from this source should be found necessary.

On many of the main arterial roads of the State important works have been completed, but they consist mostly of short lengths of construction or reconstruction necessary to link up existing sections of roadway already in fairly good condition.

In the construction of lateral and developmental roads in Gippsland and other parts of the State, where such roads are of prime importance, excellent progress has been made, taking into consideration the difficulties already referred to that have had to be contended with.

In the board's first annual report special reference was made to the large number of old timber bridges and culverts throughout the State that required renewal or extensive repairs, and to the desirability of replacing or redecking these as the case requires, with more durable materials, such as reinforced concrete.

A number of photographic views in the board's third annual report—just to hand—will serve to illustrate the character of the work carried out under such

circumstances. In every instance the new structure has replaced an old timber bridge that was either completely worn out or in such a state of decay that it would not have been economical to expend further funds in repairs. Included in the appendices to the report are a set of reproductions of drawings, showing details of construction and reinforcement of a suitable type of beam bridge which has been adopted by the board for spans varying from 15 ft. to 40 ft.

MAINTENANCE WORKS.

In an appendix of the board's first annual report the distinction between works of maintenance and permanent improvements as defined by sec. 3 of the Country Roads Act was explained, and for the guidance of municipal engineers general instructions were given for the preparation of specifications for the carrying out of works of maintenance and general repairs of main roads.

In some shires where roads have been proclaimed and gazetted as main roads, the council, in anticipation of works of "permanent improvement" being undertaken at an early date, have failed to maintain certain of the main roads, and consequently they are not now in as good a condition of repair, or, to quote the words of the Act, these roads are not in the same "state of utility" as they were at the date of their declaration as main roads, although the board has provided funds for their maintenance.

As the terms for repayment by the councils of Loan Funds expended on permanent works which extend over a period of years are much easier than the terms for repayment of funds expended on road maintenance, which are a charge on the revenue of the shires during the year following the expenditure, there is a tendency in the case of some of the councils to allow their roads to get into such a state of disrepair as to necessitate their reconstruction in the near future. The board, however, intimate that this cannot be permitted. In its preliminary inspections of roads the board made careful notes of the "state of utility" that every main road was in at the time of its declaration, and if it is found that they have been permitted to deteriorate from that date through neglect of maintenance, that deterioration will require to be made good out of maintenance funds, even if the restoration necessitates extensive repairs.

Apart from this aspect of the case, however, owing to existing financial conditions, the time when works of permanent improvement may be authorised cannot be forecasted, but as it is not desirable that the condition of the roads should be allowed further to deteriorate, councils are advised to take advantage of the funds placed at their disposal by the board from year to year, and provided for out of the Country Roads Board Fund for the maintenance, repair, or renewal of the surfaces of such of the main roads within their shires as have been allowed to get into a condition of disrepair.

In the board's first annual report it was noted that the term "maintenance," as applied to a road, means the carrying out of all operations necessary to prevent it from deteriorating, and that if maintenance be delayed the road will require to be "repaired," the extent of the repairs depending upon the extent to which "maintenance" has been neglected.

The board now point out that by the judicious expenditure of maintenance funds in the repair, patching, or renewal of the surfaces of such roads as have been allowed to get into a condition of disrepair, they may be gradually brought up to such a good condition that the more expensive work of reconstruction may be postponed indefinitely. In other words, a bad road may be made a good one by a judicious system of repairs or partial renewals. "It may be," it is added, "that on certain roads the extent of the necessary repairs is such that the cost of making good the whole length of a road in one season would be beyond the financial resources of the shire, but if the work of renewal were systematically practised by taking in hand and making good a section of the road each year, its complete restoration to a good trafficable condition would be effected without unduly encroaching upon the shire's revenue in any one year."

Reinforced-concrete Tanks.—In these days when all metals are scarce and expensive the use of reinforced concrete can be substituted with advantage in the building of tanks. Several large concrete tanks have been constructed on the roof of a biscuit factory at Fulham, and, as a precaution against leakage, Pudlo has been used to waterproof the cement.

SOME RECENT PUBLICATIONS.*

THE DEVELOPMENT OF BRITISH BUILDING CONSTRUCTION. By C. F. Innocent, A.R.I.B.A. Price 10s. 6d. nett. Cambridge University Press.

Most students of mediæval architecture have in the past devoted their attention almost entirely to the stonework of the ecclesiastical buildings which still remain to us. We have all of us been brought up to regard the architecture of the Middle Ages as capable of being sorted out into its various periods. The round arch of Norman times, the pointed arch of Early English, and the flattened arch of Tudor days have absorbed most of our attention, together with the particular forms of moulding and special details applicable to each style.

Mr. Innocent has, however, written a most interesting book, which reminds us that these stone buildings, whether castle or palace, cathedral or church, although these are all that survive to us, made up but a very small part of the buildings of the Middle Ages. The larger proportion of the population, probably 90 per cent, lived in a very different class of habitation, and the dwellings of the people, whether in town or country, with their farms and their barns, were for the most part built of much less durable materials.

It is with the development of the construction of these lesser, but all-important, buildings that Mr. Innocent deals. He shows in a delightful manner how, by a process of quite natural transition, the wattle hut became the timber-framed cottage, and so on, to the labourer's cottage of more modern times.

Mr. Innocent deals in a most interesting way with the origin of the various forms of floors, slate and thatched roofs, and gives a special chapter to each. Thatched roofs are of very ancient origin, and for many a long century tiles were practically the only alternative for common use, lead being too expensive. Heavy stone slates were used in some parts of the country, but their use was largely limited by the vicinity of the quarries, although in Roman days the use of split stones for roofing purposes was widespread. The wide use of ordinary thin slates is, however, comparatively recent outside the districts in Wales and the English lakes close to the quarries, and outside these districts it will be difficult to recall many slate roofs more than a century old.

Doors and gates are next touched upon, and the chapter on windows and chimneys is full of interesting information. The use of glass in window frames of ordinary buildings is not more than 400 years old. Prior to that date the windows of a house were hung with a kind of coarse cloth, probably oiled as a protection from the weather. Open unglazed windows were common enough in country districts a century or so ago, the opening being closed with a shutter. The modern sash window dates from the latter half of the seventeenth century, but here again it did not come into general use until 150 years ago.

There is such a mass of closely packed detailed information in this book, with comparative information collated from all over Northern Europe, that one almost loses grasp of the general trend of construction in our own little island. This is a book thoroughly well worth the labour of close study, and the author is to be congratulated on the scholarly way in which he has brought together such diverse sides of his subject. Here and there, too, we get an interesting sidelight on the etymology of the terms used in everyday building. There is perhaps almost too diversified information on the subject. The examples given of each form of construction are more than sufficient to prove the author's argument, and in some cases there are too many to allow of clear continuity of thought by the general reader. It is, of course, clear that any one form of construction has in most cases many possible lines of descent from its predecessors, and one can only admire the care and scholarly enthusiasm which has made such an investigation possible.

Belfast Ferro-Concrete Outlet Sewer.

Under the Belfast Main Drainage Act, 1887, intercepting sewers were constructed to convey the sewage of Belfast, which was previously discharged by numerous outlets into the river Lagan, to one common outfall on the Antrim side of Belfast Lough, and storage tanks were constructed to impound the sewage as the period of discharge was limited to the first 3½ hours of each ebb tide. So that the sewage should not be discharged on tidal lands, an outlet sewer 1 mile long was constructed across the foreshore to discharge into the Whitehouse Roads. The outlet sewer consisted of two tubes, each 8 ft. by 4 ft., and was constructed of timber, but it was never satisfactory, and has always been expensive to maintain.

In 1911 Parliamentary powers were obtained for carrying out various works, including a new outlet sewer of ferro-concrete to replace the original wooden structure.

In the Corporation Act of 1899 a clause was inserted providing for the purification of the sewage before discharge into the Lough, and as the sewage is now all sedimented the outlet sewer only discharges effluent and storm water. The new structure has three tubes 6 ft. 6 in. square constructed in situ; it is anchored down to timber piles to prevent flotation when the penstocks are closed and culverts pumped out for cleaning. The underside of the structure at the outlet end is 4·08 ft. below ordnance datum, and the tide levels are as follows:—

Average high-water level (spring tide), 13·1 ft. above ordnance datum.

Highest tide known, 17·76 ft. above ordnance datum.

Average low-water (spring tide), 3·69 ft. above ordnance datum.

As the shore end of the culvert is covered with water at half-tide the work had to be carried out in cofferdams, and borings which were made before the work was commenced showed that the subsoil into which the piles had to be driven consisted of from 20 ft. to 30 ft. of estuarine clay, locally known as slutch, overlying sand. To enable the work to be carried out at all states of the tide it was necessary that a gangway should be constructed above high water connecting the work with the shore, and to save the expense of temporary work it was decided to make use of the timber anchor piles for the purpose of the gangway.

The work was commenced by first partly driving the whole of the anchor piles, which were in four rows. The piles being 10 ft. apart in each row, leaving their heads well above high water. The pile driving was started at the shore end, the gangway being constructed on the tops of the piles as the pile driving proceeded, and when the whole of the piles had been thus driven and the gangway constructed, the cofferdam was commenced at the seaward end. To facilitate construction, and to enable the culvert to be cleaned out, if it ever became necessary, sets of three penstock frames were built in at distances of about 320 ft., and as the first length of cofferdam was about 400 ft., it

Belfast Ferro-Concrete Outlet Sewer. View of Cofferdam.

embraced the end of the culvert and two sets of penstock frames.

The temporary sheet piling for the cofferdam was supplied by the Ransome-verMehr Machinery Company, and had to be driven to about 20 ft. below the

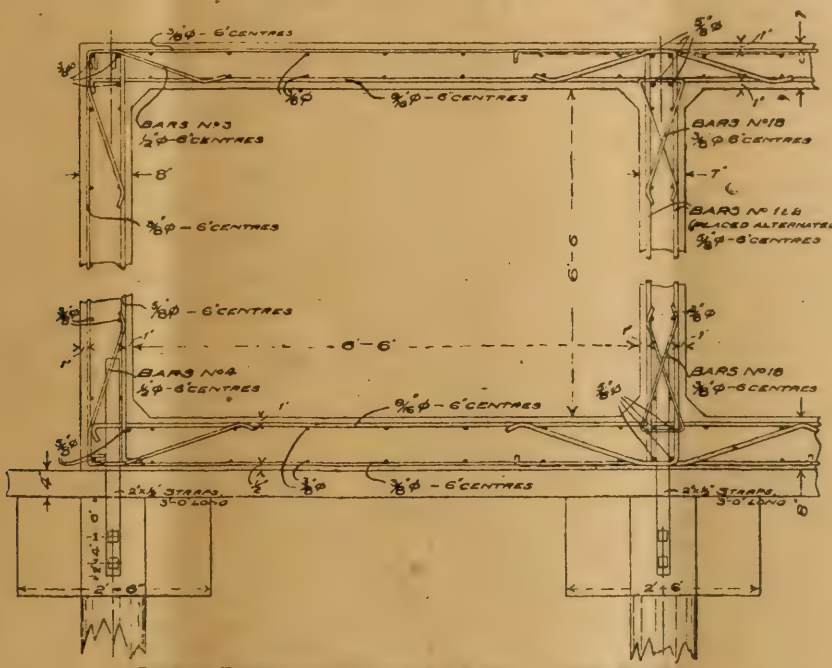
Inside of Cofferdam, Belfast Ferro-Concrete Outlet Sewer.

bottom of the excavation before the work could be satisfactorily proceeded with. When the first dam had been enclosed the anchor piles were re-driven to the depth required, the earth inside the dam excavated, and the gangway removed, the framing for the dam being put in as the excavation proceeded. After

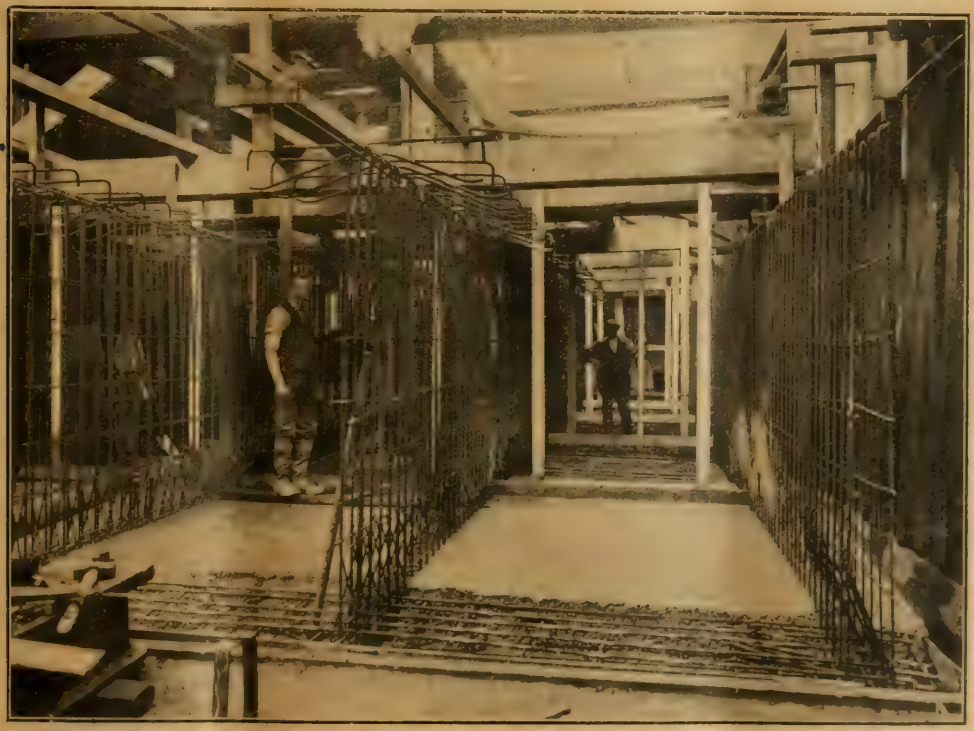
the excavation was completed the anchor piles were cut off to their proper level and iron anchors were bolted to them and surrounded with concrete.

When the cofferdam was first constructed the toes of the sheet piles were only 10 ft. below the excavated level, but as a rise and fall of the bed inside the dam of about ¼ in. occurred with each tide and caused cracks in the concrete before it had time to set, it was necessary to re-drive the sheet piles to the depth already mentioned. To avoid any cracking in the culvert, due to elasticity of the bottom, it was decided to put 12 in. of base concrete under the ferro-concrete structure, and although cracks did appear in such concrete all movement ceased when it was set, enabling the ferro-concrete work to be constructed without cracks and without the slightest difficulty.

A length of about 400 ft. of the triple culvert has been completed and tested, and the cofferdam drawn; but as, owing to the war, it has been impossible to obtain materials and labour, the work is now practically at a standstill.



Belfast Ferro-Concrete Outlet Sewer: Cross Section.



Reinforcement to Walls and Floor of Belfast Ferro-Concrete Outlet Sewer.

The work was designed by Mr. Henry A. Cutler, city surveyor, Belfast, and is being carried out by Messrs. J. & R. Thompson, Limited, contractors, Belfast, under the superintendence of Mr. F. W. Lucas, who is acting as resident engineer.

DECIMAL WEIGHTS, MEASURES, AND COINAGE.

To the Editor of The Surveyor.

Sir,—My attention has been drawn by an article under the above heading in your issue dated January 26th by Mr. Edward Barton, M.I.E.E., F.R.G.S. The article is almost word for word identical with the address I heard him deliver in the Council-Chamber of the London Chamber of Commerce on January 25th. I got up to reply to some of his points, but give my views at greater length here, if you will favour me with publication.

The point of view of every metric advocate is complete decimalisation. He can see nothing outside this, and any person who opposes that view, or the French metre, is hopelessly out of date and of insignificant understanding. So much has this intolerant attitude imposed upon the multitude that men who, like myself, have broader, and I think more cosmopolitan, views, are pushed aside, and run the risk of being trodden under foot by the crowd we are trying in various ways to save from a dangerous mistake.

During the address Mr. Barton mentioned that ten was the natural number, because each human being had ten fingers and ten toes. I did not refer to my own or anybody else's toes, but in my reply I claimed that I had, counting in the wrists, six attachments to each palm. I go further in this letter, and claim the human hand as a symbol of a perfect international system of weights and of measurement.

We have in each hand four fingers, together eight, and with the "feet" thrown in (a method of duplication) we can count to sixteen. This is the fractional scale, which governs most of our simple tables of weight and capacity. Adding in the thumbs, we get two "bunches of fives," or two tens if duplicated. This is the decimal scale. Taking in the wrists and ankles we get twelve and twenty-four, the duodecimal scale. As I have said before (The Surveyor, October 13, 1916, p. 330), we have mixed these three natural scales up and produced the "distracting jumble" complained of by metric advocates. I claim that all we have to do is to separate the scales, and to complete and slightly to correct them, when we shall find we possess:—

(*a*) A metric scale, as complete and perfect as the French system, but with a slightly longer metre, 39·6 in., as against 39·37 in., in fact. There is no "pandering to the gill and pint people" in the British decimal system.

(*b*) Simplified fractional scales, free from decimal and duodecimal theory, easily learnt, and most convenient to use, with vulgar fractions, and mainly with mental arithmetic, as opposed to abstruse calculations on paper.

(*c*) A duodecimal scale as perfect as the metric, and just as likely to be useful.

When I add that this system of three scales is older than ancient Babylon, that it has come down to us with an accuracy within the one-thousandth part of linear dimension that is strictly commensurate in all its branches [illegible] book, "British Trade and the Metric System"), and that its convincing truth revolutionises all previous theories of weights and measures, I can say little more. There is no object now in referring to the half-informed opinions of James Watt and other worthies. For some inscrutable purpose [illegible] was withheld from men until an absolute accident disclosed it to me while engaged in making a practical means of decimalisation of our own system on totally different lines. Never in my wildest dreams did I hope for or anticipate such a wonderful and fortunate result.

Now, sir, I ask you and all your readers and through The Surveyor, all the world, what ought humanity to do with this lucky discovery? The Decimal Association, who boast of it, have made one definite and important step through Mr. Barton.

The people before this country are only two. Adopt the French 39·37 in metre and scrap every other unit you possess, or accept that 39·6 in metric and keep all you have as well. I urge the nation to follow the latter course because:—

(*a*) With the 39·6 in metre we keep all our statistics and records. We already possess the rod, pole, or perch of 5 metres (British), the furlong of 200 metres, the square rod of 25 square metres, the rood of 1,000 square metres, and the acre of 4,000 square metres. We have a metric ton, and a metric hundredweight of 100 half-kilograms (British), each of 1·12 lb. We have a metric system already. What do we want with a modern approximative substitute?

(*b*) We adhere to a more accurate earth-measure than the French metre.

(*c*) We rouse our international jealousy, because our metre is British only in name, and native only by reason of long naturalisation.

(*d*) We retain the power of working in vulgar fractions when it suits us to do so.

(*e*) We upset nobody; we confuse nobody; we injure nobody. We do not even disturb the scientific men and electrical engineers who still desire to work in French metric units.

(*f*) We have already done much standardisation, the results of which we shall not surrender.

(*g*) The British and French decimal systems being in strict proportion in all parts, calculations made in the one are equally correct in the other, and formulæ, constants, results, &c., will be international and interchangeable, given the same general conditions and premises. You could not, of course, say that a vessel which contained 150 cubic centimetres French would also hold 150 cubic centimetres British.

(*h*) The British system, corrected and simplified, would become the most democratic of all our practical institutions. It favours as it is no class, and ignores no man, not even the meanest or most criminal and undeserving of citizens. The man who works by twos or threes, the man who works by tens, the man who wants to use eighths, sixteenths, and sixty-fourths, equally with the man who can only think clearly in decimals, are helped and served by it. We have brought our troubles on ourselves by abuse and misuse of the system to a larger extent than is generally thought.

Our currency is just as considerate and helpful. For large transactions the florin can be divided into 100 cents of account (not coined). You get the shilling of 50, the sixpence of 25, and the three-penny bit of 12½ cents. Then, because 12½ is so inconvenient a divisor, and the cent so awkward, clumsy, and frightful a small coin to employ, you divide the three-penny bit into twelve farthings, and simplify mental arithmetic and the giving of small change, to the saving of many thousands of pounds annually in labour and in time. I have always felt exceedingly sorry for the people of Ceylon. Asiatic fatalism has accepted the inevitable, and bowed to those in authority, but the act, in my opinion, is one of which any dominant race cannot be proud. Had Ceylon possessed a democratic Government the cent would have gone elsewhere.

I will conclude with one general question: Are valuable national assets, like those possessed already by the British in their existing decimal weights, measures, and coinage and fractional scales, to be scrapped like so much dirt?—Yours, &c.,

E. A. W. Phillips, M.Inst.C.E.

Hove.
January 27, 1917.

To the Editor of The Surveyor.

Sir,—It is to be hoped that Mr. Edward C. Barton's article on our weights and measures will conduce to the advancement of public opinion in favour of a change being made in our measurements and monetary methods.

I was struck by his remark that in the school life of our children there is not adequate time for the due acquisition of knowledge owing to the time being wasted by the employment of our circumlocutionary weights and measures system. This cannot be doubted, but there is another more wasteful and time absorbent procedure that is, our orthographic system—if indeed it can be characterised a system. There is method in our weights and measures, but madness prevails in the method of lettering words. Figures have one value so have measurements; five is never

SEWAGE PUMPING: CENTRIFUGAL PUMPS v. PNEUMATIC EJECTORS.

To the Editor of THE SURVEYOR.

SIR,—We understand that your paper publishes full "Proceedings" of the Institution of Municipal Engineers, and we note that recently a paper on "Some of the Uses of Electricity in Municipal Engineering" was read before this institution by Mr. Horace Boot.

In this discussion we note that Mr. H. C. H. Shenton said:—

"It did not seem to be generally recognised that sewage could be pumped electrically in large or small quantities by centrifugal pumps, driven by electric motors. The small pump was quite as efficient as the large one, and this method was greatly to be preferred to a long and expensive system of air-pressure mains, and a central station for compressing the air. In most towns electric power was now available, but even if it meant putting down an electric-generating plant, this would still be the better scheme."

As manufacturers of pneumatic ejectors, we should therefore like to put before you our views on this matter. Seeing that the question at issue is of great importance to municipal engineering, and that Mr. Shenton's adverse criticism on pneumatic ejectors might bias intending users, we hope you will favour us by publishing this letter in your journal.

(1) No machined surfaces or bearings are in contact with the sewage in ejectors, whereas the shaft and bearings of centrifugal pumps are always in contact.

(2) The ejector cycle is usually once per minute, the centrifugal pump cycle is usually 1,000 per minute, or more. Thus the wear and tear is great in comparison with the centrifugal pump.

(3) The high velocity of the sewage and grit past the vanes of a centrifugal does not occur in pneumatic ejectors. At no part of the ejector can high velocities of sewage create great erosion.

(4) It is not possible to work two centrifugals into one rising main without greatly reducing the efficiency of same by reason of the increased velocity of sewage, and the consequent greater head on the pumps.

A centrifugal pump to give a high efficiency must deliver a certain quantity at a certain head. If either is varied its efficiency drops rapidly. On the other hand, a pair of pneumatic ejectors, working intermittently and alternately, will work equally well into the same rising main as a single ejector.

(5) It is necesary with centrifugal pumps to have sumps, the pumps coming into work when the sump is full, and stopping when the sump is empty. This has two obvious sanitary disadvantages: (*a*) Storage of sewage is wrong, as it allows of decomposition, and gases evolved must be allowed to escape, or else the pumps may, even though submerged, refuse to work. If ejectors are used these foul gases are not allowed to escape until they reach the outfall works. (*b*) Large sumps emptying and filling leave large surfaces covered with semi-decomposed water exposed to the atmosphere, thus greatly increasing the insanitary effect of sumps. Although the ejector fills and empties in the same way, it is filled and emptied frequently; thus the sewage in the bodies of the ejectors is always fresh, and therefore not so insanitary. Secondly, the air escapes in a compressed state, so that it expands when it reaches the atmosphere, and is thus largely diluted and cannot cause so much nuisance as the air forced out of a sump as it fills. Thirdly, the sewage in the ejector is under pressure, so that there is no effervescence of the foul gases as in open sumps.

(6) No screens are required for ejectors. They will take the sundry matters that get into sewers, from intestines to bricks, which a centrifugal pump refuses to pass.

(7) Another class of objection to centrifugal pumps is their action in hot weather, not that we often get it in England, but in tropical climates this objection becomes serious. It affects the centrifugal in two ways: (*a*) The sewage is less diluted, with the consequence that the viscosity is increased considerably; the friction in rising main is thus greatly increased and requires a greater horse power in the motor. At such times the pump works very efficiently. We do not, as a rule, in England experience long periods of excessively hot weather, but they occur occasionally, and it is then, when the sewage should be dealt with most expeditiously, that the trouble begins; (*b*) the decomposition of sewage is, of course, much increased in hot weather. The sewage in a centrifugal pump is broken up to a greater extent, and even when the pump is submerged there is a slight vacuum on the intake. Thus decomposed gases are evolved, and at times even stop the work of the pump. The action is similar to that of aërated water in bottles. If under pressure with the cork in place, there is no effervescence. This is the condition of sewage in a pneumatic ejector. If the cork is removed, so that the water is under atmospheric conditions, rapid effervescence occurs. This is what happens in parts of the centrifugal pump.

(8) If centrifugal pumps have to be arranged in the streets, and below the surface, the electric motors must also be arranged below ground. Even if such chambers are tight in reference to the subsoil water, they are always damp from condensation, and liable to flooding, and it is impossible to prevent such dampness from affecting the switches and motors, however well they are enclosed. On the other hand, the motor driving the compressor for an ejector installation may be a considerable distance away from the ejector, and arranged above the ground in a dry atmosphere.

(9) With a pneumatic ejector the rising mains can be scoured by letting the full flow of compressed air on to one ejector, thus producing a very high velocity in the mains. This cannot be effected by the centri-

rugal pumps, unless the motors are of much greater power than is normally required.

(10) If an ejector is to be inspected it can be completely emptied by blowing it out, leaving not only the ejector but also the rising main empty. This is extremely handy, especially when alterations have to be carried out to the plant or to the rising mains.

(11) In small schemes the compressed air can be generated in pot-suits, and sufficient air stored to work the ejectors during the night.

(12) Electric switches are delicate things, and the repair account for them is high, compared with the cost of upkeep of ejectors. For the majority of ejector schemes one ordinary labourer can supply the necessary attention. The ejector stations are inspected about once a week. If anything goes wrong with any station the man in charge of the compressors has an instant indication pressure gauge, and by listening to the exhaust at ejector station he can detect it without going into the station. For an electric installation, if the man in charge is not an electrician, an electrician, at much higher wages than an ordinary labourer, is an absolute necessity. If anything goes wrong with an electric installation the fuses blow out and the pump stops, and there is no distinct indication that there is anything wrong; thus the stations must be visited constantly.

Ejector stations have been shut up for months together while working, and the chambers never entered, but no one would dream of this in the case of automatic electric switches.

(13) The efficiency of ejectors is not easily comparable with that of centrifugal pumps, for the efficiency of small pumps is an unknown quantity. If the pump is new, is running at the speed it was designed for, and lifting water, it may give anything from 50 to 70 per cent. If it is small and has been running for some time, the efficiency may be anything below 50 per cent.

If the horse power of the motor which is supplied for small centrifugal plants is noted it will be seen that a very low efficiency is anticipated. For instance, we have seen motors supplied by well-known makers of centrifugal pumps of larger horse powers than we would have put in for driving compressors for lifting by means of ejectors. The fact is, the efficiency of the small centrifugal pump may be 50 per cent when new, but it falls off when the pump gets worn with road grit.

Thus the efficiency of ejectors should not be compared with that of centrifugal pumps when new, but when they are half worn out, when the ejector will be found to be at least equal to the centrifugal pump, and, in most cases, higher if the air pressure is reasonable—i.e., not greater than 25 lb. per square inch.

The table below gives the efficiencies which may be expected from the Adamson pneumatic ejector plants:—

Pressure above atmosphere.	Total head of water in feet.	Efficiencies to be expected	
		Old type.	Deb efficiency type.
5	11·54	52	65
10	23·07	54	65
15	34·61	49	65
20	46·14	44	65
30	69·21	38	65
40	92·28	34	65

The above are the all-round efficiencies of water h.p. to b.h.p. exerted in driving air compressors.—Yours, &c.

THE DESIGN AND COST OF RESERVOIRS.

To the Editor of THE SURVEYOR.

SIR,—I have read with great interest Mr. Baker's letter in your issue of January 19th. Mr. Baker indicates that the actual cost of the roof and pillars was about £18,000. Now I have already pointed out that the flatted crowns of the domes having a minimum cover of only 9 in. of earth are very liable to develop cracks (Mr. Binnie says minute cracks have already appeared), as the minimum thickness is only 6 in., the work is not reinforced, and in hot weather the temperature of these parts of the roof is bound to vary considerably. Therefore I think it only reasonable that before his figure is compared with mine Mr. Baker should add the cost of completing the asphalt covering of his roof. If this be done, our figures are not far apart.

It may possibly appear to Mr. Baker that my estimate has been pared down as far as possible, but this is not so. For instance, I have assumed an average wall thickness of 8 ft., whereas, the wall being half buried in the solid red sand, which about foundation-level Mr. Binnie says is practically rock, I am confident that a thickness of 6 ft. 6 in. would be entirely sufficient.

Now with regard to Mr. Baker's objections to my unit prices. As may be gathered from my first letter, I estimate for 8 to 1 concrete, so that, considering my wall concrete is much thicker than Mr. Baker's, and is straightforward work, I venture to think that my concrete figures are not far wrong. My prices of 2s. 6d. for a single ½-in. layer of asphalt on floor, and 4s. for two ⅜-in. layers on walls, are from quite recent work carried out by a very large firm, all material being analysed by experts. (While Mr. Baker is on the subject of prices it would be interesting if he would favour us with the unit prices for the pillars and roofing, as this work is unusual in this country.)

On the whole, I see no reason for revising my round figure of £69,000, but, for the sake of argument, suppose we make the following additions—viz.:—

Soiling, 50 per cent	£300
Concrete, 2s. 6d. per cubic yard ..	2,700
Asphalt on floor, 50 per cent ...	1,190
Roof drainage, 50 per cent ..	500
	£4,690

This would bring my figure to £73,690, as against Mr. Baker's £73,500. Even taking Mr. Baker's cost for my reservoir (£85,000), we are still very far indeed from Mr. Binnie's figure of £5,000 per 1,000,000 gallons (£140,000).

Now let us consider open reservoirs. Taking the figure of £73,690, and deducting the cost of the roofing (which is free to slide on the walls), roof drainage, part of soiling, &c., we get the cost of an uncovered reservoir as less than £52,000, so that roofing has added over 40 per cent to the cost of the uncovered reservoir.

Again, suppose we removed from the Cross Hill reservoir the roofing, the pillars, and the girders in the wall, &c., which have probably cost about £20,500. We would then have an open reservoir with walls averaging only 4 ft. thick. To bring these walls up to the 6 ft. 6 in. thickness previously mentioned, with 8 to 1 concrete, at, say, 27s. per cubic yard, would cost about £6,500. The cost of the open reservoir would thus be £73,500 − £20,500 + £6,500 = £59,500.

My idea of the cost is, of course, very much less than this, and, considering the nature of the foundations, I have figured out that if the lower part of the wall had been built as a slope wall (as at Frankley) the cost would have been in the neighbourhood of £1,500 per 1,000,000 gallons.

Mr. Baker, however, maintains that an open reservoir would have cost more than £2,625 per 1,000,000 gallons.

As I have ventured to put forward an estimate for an ordinary *covered* reservoir, may I now ask Mr. Baker to put forward *his* estimate of an ordinary *open* reservoir?

Half-a-dozen years ago two Westminster water engineers of long experience reported to a corporation that an open masonry reservoir (somewhat smaller than Cross Hill) would cost £1,600 per 1,000,000 gallons, the site being an average one.

Unfortunately, no drawings of the Cross Hill reservoir have been published, otherwise it is probable that not a few persons would have challenged Mr. Binnie's remarks as to reservoir costs; at least one well-known engineer of my acquaintance would have objected to the thickness of the crowns of the wall arches, considering the possible compression of the earth backing when the reservoir is full, and probably reinforced-concrete specialists would consider that the steel girders could have been replaced by steel reinforcing rods with considerable economy.—Yours, &c.,

WATER.

P.S.—I find that the figure I gave for the Honor Oak reservoir in my first letter included connections and land. The reservoir by itself cost about £3,600 per 1,000,000 gallons. (Report, Metropolitan Water Board, 1910.)

January 29, 1917.

PROFESSOR ADSHEAD AND "LOCAL SURVEYORS."

To the Editor of THE SURVEYOR.

SIR,—Professor Adshead in your issue of last week assumes a rather lofty and sarcastic kind of humour in his reply to my letter of January 12th dealing with his unwarranted and ungallant aspersions upon local authorities and their surveyors in respect of the abilities of the latter in carrying out town-planning schemes.

I still assert that the Professor's attack was groundless and unjustifiable, and this opinion I am pleased to find was supported by your able reference in the article on "Housing" in your current number.

So far as the elevating of the architectural profession is concerned, to enable them to construct roads and lay sewers possibly this may be necessary, as we "local surveyors" have had many sorry examples brought to our notice.

It is regrettable that the Professor fails to see any reason for detracting from the statement made in his lecture, as one would have thought that any person of reasonable intelligence would ere this have discovered that such statements were an insult to a body of professional men.

It is quite refreshing to read what a high opinion Mr. Adshead holds of his own profession, even if only (per his own words) for the science of "cottage building," and we surveyors will readily admit that specialising by architects in this direction is very necessary, and, further, that cottages recently erected by "local surveyors" easily outstrip from any point of view the efforts of the architect up to the present.

As to the Professor's reference to which is the better of the two professions, although I did not originally refer to this subject, I have no hesitation in claiming pride of place for our own, this being assured from our wide field of training, experience, variety of work involved, and the diplomacy necessary and employed in dealing with the other "professions."

I claim for surveyors that the right to town planning, and not that of the architect; the latter may come along later when the speculation of the builder or company commences. But having carried out the preliminary surveys, notices, enquiries, &c., made the roads and constructed the sewers, then if our authorities require we can and should complete the whole; but, while not being desirous of entirely ousting the architect, we ask for immunity from unjust attacks.

When we see so much of architects embracing surveying — "*vide* brass door plates and elaborate stationery"—the former should not "bark" at the latter if he does likewise.

I notice Professor Adshead is announced to deliver a further lecture on "Town Planning." My advice is: Stick to the architectural aspect, and evolve a good home for the artisan at rents within his means, and so prevent overcrowding, &c.

The merchant princes and villadom can look out for themselves; 'tis the community at large that requires proper housing and town planning.—Yours, &c.,

LOCAL SURVEYOR.

January 30, 1917.

AFTER-THE-WAR TRADE: OVERSEAS INDUSTRIAL EXHIBITIONS.

To the Editor of THE SURVEYOR.

SIR,—No less important than the reorganisation and speeding-up of our industrial system at home in readiness for the post-war commercial campaign is the complete remodelling and extension of our official agencies overseas.

Though there are numerous Government Committees appointed to devise ways and means for financing overseas contracts, nothing has yet been done officially to reorganise and extend our Consular system and multiply the number of His Majesty's Commissioners. We have far fewer trade commissioners than we should have, and those already engaged spend more time in compiling useless statistics than in actively extending British trade. The fault lies not so much with the men as with the system.

The Associated Chambers of Commerce have recently presented to the Government a report embodying recommendations for drastic reforms in these directions, but they do not appear to have considered the question of the establishment of permanent exhibitions of British manufactures abroad. In our judgment, any scheme of reorganisation that fails to provide these institutions in the great foreign and Colonial buying centres will lack the chief essential to success. It cannot be too strongly impressed upon the Government and the British manufacturer that the overseas buyer *wants to see the goods he is buying*. That is half the battle! For the rest, quote him figures in his own currency, at prices that include delivery at his nearest railway depot, with reasonable credit based upon the custom of the country, and no amount of competition that we are likely to meet, East or West, will seriously stand in the way of our highly organised workshops.

The Board of Trade has recently issued thousands of invitations to overseas buyers to visit the great Trades Exhibition to be held here in the spring. This is, in itself, no small tribute to the "pulling power" of the exhibition, but it is at the same time a confession of weakness. It would be infinitely better to take the exhibitions to the people overseas than to bring the people to the exhibitions.

Permanent exhibitions to which overseas buyers can go every day are vastly superior to annual displays thousands of miles away, to which not a thousandth part of the overseas buyers will ever come.

Just before Mr. Asquith's Government collapsed it was announced in the House of Commons that such exhibitions for the chief buying centres in Canada were "under consideration," but as nothing has since been heard of the proposal, it has probably followed in the wake of the Government.

We want these institutions all over the habitable globe, and if we can get them established, they will, in our judgment, do more to boost British trade and keep our machinery employed after the war than any other agency that we can put into the field.

Such a scheme, if properly organised, would be largely self-supporting. Tens of thousands of British manufacturers who find it impossible to open and staff overseas branches would readily spend a few hundreds of pounds per annum for business spaces and trade representation in exhibitions in the world's buying centres. The nearest approach to the idea that we know of is to be found in the Civic Industrial Bureau, organised by the Winnipeg Municipality, and the later developments of the Canadian manufacturers, who, we understand, are not only organising a permanent exhibition of their wares in London, but are arranging to run an exhibition train through France.

Apparently, all we want here, as elsewhere, is a Government lead, and now that the more active spirits are in power let us hope that we may get it.—Yours, &c.,

BARIMAR, LIMITED,
Scientific Welding Engineers.

AN ORGANIZERS' CLEARING HOUSE.

To the Editor of THE SURVEYOR

SIR,—We have reason to believe that there is in the country a supply of talent and energy available for useful work which at present is either unable to find an outlet for its capacity or is misapplied.

The need for perfecting, and assisting, existing organizations is generally admitted, and there is evidence on every hand that the volume of new work to be undertaken is destined to increase.

In the stress of war the obvious need for a clearing house and intelligence department for the organizer has been overlooked. In the conviction that such a machine is useful and necessary both for workers and for those who employ them, we have opened an organizers' clearing house with the following objects:—

(1) To act as consulting organizer.

(2) To provide—and, if necessary, to superintend—organizers to assist useful work which is already being done.

(3) To provide—and, if necessary, to superintend—organizers for new work.

(4) To help "square pegs" into "square holes."

(5) To collate information about the scope and activities of existing organizations, so that those who desire to give their assistance may be guided in the right direction.

Organizers and secretaries of associations, leagues and similar societies are asked to send any information about their work and requirements, which they may

desire to be at hand for reference, to the secretary of the Organizers' Clearing House.

Those who want employment in the higher grades of organization work are invited to apply in writing to the secretary, stating their previous experience, qualifications, salary, and nature of work desired.

Suggestions from those to whom the plan of the clearing house appeals will be welcome, and should be addressed to the secretary.—Yours, &c.,

CHICHESTER.
PERCY.
F. P. WHITBREAD.
A. E. OWEN.

RULE OF THE ROAD IN ENGLAND.

To the Editor of THE SURVEYOR.

SIR,—The question of the rule of the road in England is one which I have for some time thought is worthy of attention. Considering the large proportion of Britishers who have now become accustomed to right-hand-running traffic, through being in France and elsewhere, it will cause some confusion to these when resuming life in England. It is common experience that one very readily becomes accustomed to traffic on the right-hand of the road, but upon reverting to left-hand running one is confused for quite a long while.

After the war we look forward to considerable international movement and interchange of traffic, and if we bring our rule into line with the majority it will greatly simplify matters, not only to the drivers, but also to the manufacturers, who will be able to standardise in this respect.

Regarding the question of the 'buses and other vehicles which have been specially constructed for English rule of traffic, I would point out that their number is now lower than it is ever likely to be again, so that as new ones are required they can be built to suit the new condition.

Seeing that the people of England have so long become accustomed to abnormal traffic conditions, owing to reduced lighting and other causes incidental to the war, the immediate "after-the-war" period would be the most suitable in which to introduce a change of this nature, and before we again get into the practice of ante-war methods.—Yours, &c.,

N. D. BLAGDON PHILLIPS.

British Army in the Field.
January 29, 1917.

THE WORCESTER ACTIVATED SLUDGE EXPERIMENT.

To the Editor of THE SURVEYOR.

SIR,—I observe that in your reference to the activated sludge experiment now being conducted at Worcester, which appears in your issue of yesterday [p. 82], you state that the air delivered to the sewage is passed through pulsating valves so as to be discharged intermittently.

This is not the case. The air has been delivered continuously throughout the whole period of the experiment, which is still going on.

I thought you would like to have the statement corrected.—Yours, &c.,

THOMAS CAINK,
City Engineer.

Worcester,
January 27, 1917.

[While the passage in our special article on "Sewerage and Sewage Disposal" to which Mr. Caink draws our attention may at first sight appear open to the construction he has placed upon it, careful reading will show that the statement that "this method of treatment had then been in operation at Worcester" had no reference to the introduction of pulsating valves, but to the activated sludge process. At the same time, we freely admit that the use of the words "activated sludge process" instead of "this method of treatment" would have conveyed more clearly the meaning of the writer of the article.—Ed. SURVEYOR.]

Glasgow Tramways Free from Debt.—At a meeting of the Glasgow Tramways Committee on Wednesday it was announced that the system was now free from debt, all the capital expenditure of £3,535,156 having been repaid.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRY HELD.

West Riding Rivers Board (January 30th. Colonel T. C. Ekin).—This was an application for consent to take proceedings against four firms of chemical manufacturers who were alleged to have polluted the rivers by discharging acid into them.—Mr. Howarth, for the board, stated that the pollution complained of in these cases consisted of waste acid, and washing water containing acid of less strength, being discharged into the river. Pollution by waste acid should never be allowed to arise, and any wastage on that score was merely allowing the commission of sinful waste. Numerous and bitter complaints, extending over a long period, had been received by the Rivers Board from various manufacturers who had to use the water. The Rivers Board were loth to move, but felt that the time had arrived when it was absolutely necessary for them to apply to the Local Government Board for leave to take proceedings. Major Dent, chairman of the Rivers Board, said that during his twelve years' experience of the chairmanship the board had never had cases that gave them more trouble and required more consideration than the present cases. Dr. Wilson, inspector for the West Riding Rivers Board, said that acid in the river water would make it utterly useless for steam purposes, as the acid became concentrated in the boilers.

APPLICATIONS FOR LOANS.

Nuneaton T.C.—£19,000 for building eighty-three houses.

Willesden U.D.C.—£10,110 for the electricity undertaking.

Woolwich B.C.—£2,442 for electricity purposes.

LOANS SANCTIONED.

Hackney B.C.—£3,000 for electricity mains and switchgear.

Mansfield T.C.—£3,144 for the purchase of gas stoves for hire.

Stafford T.C.—£1,000 for electricity mains.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

SOUTH-EASTERN DISTRICT.

A general meeting of the members of the South-Eastern District will be held at the Institution Offices at 4 p.m. on Friday, February 16th.

AGENDA.

1. To read minutes of previous meetings.
2. To nominate district representative, district chairman, and hon. district secretary for the ensuing year.
3. To make arrangements for a spring meeting in Kent.
4. To consider circular from Mr. O. Claude Robson in reference to the Orphan Fund.
5. Any other business.

JOHN L. REDFERN,
Hon. District Secretary.

Richmond Bridge.—A committee of Middlesex County Council has had before it a communication from Richmond Council to the effect that the state of Richmond Bridge is totally unsuited for the traffic of the present time, and is most dangerous. The committee expresses agreement with the county engineer, Mr. H. T. Wakelam, that it is not advisable to consider the question of any expenditure on the widening of the bridge.

The Bradford Water Supply to Spenborough.—The Court of Appeal recently dismissed the appeal of the Bradford Corporation against the decision of Mr. Justice Eve dismissing with costs their motion to set aside the award of the arbitrator, Mr. G. J. Talbot, fixing the price to be paid by the Spenborough Urban District Council for water supplied by the corporation at 7d. per 1,000 gallons. The Master of the Rolls said he could not find any error on the face of the award, and he was therefore of opinion that the decision of Mr. Justice Eve was right. Lord Justice Warrington and Mr. Justice A. T. Lawrence concurred.

Law Notes.

Edited by J. B. REIGNIER CONDER, Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to "The Law Editor," at the office of The Surveyor, accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in BLACK ink only, and in such style as to be fit for direct reproduction—*i.e.*, without re-drawing or amendment. *Unless these conditions are complied with we cannot undertake to reply to queries.*

QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words as noms de plume. *The letter* X, *combinations such as* X.Y.Z., *and words such as* "engineer" *and* "surveyor," *should never be used.*

Housing, Town Planning, &c., Act, 1909, and Building By-laws.—"Ynys" writes: In this urban district a wooden hut, used as a boat-house, &c., on land reclaimed from the sea, has been extended and converted into a dwelling-house, and it was occupied on or about September, 1914. This breach of the by-laws (Model Series) was reported to the Works Committee in November, 1914. Shortly afterwards the building was inspected by the medical officer of health, who recommended that proceedings should be taken in respect thereof under the Housing, Town Planning, &c., Act, 1909, with the result that a closing order under sec. 17 (2) of the said Act was served upon the owner, who was also the occupying tenant, on June 9, 1915—and the notice of closing order, which has become operative, was also served upon him on July 31, 1915. The taking of summary proceedings, as per resolution of October 19, 1915, was deferred, because it transpired that subsequent to the issuing of the closing order the occupying tenant and owner had made alterations to the dwelling-house, and after a further report from the medical officer of health, and a resolution of March 14, 1916, to take summary proceedings for an order on the tenant to quit the house, the council were advised that the delay had made the notices ineffectual. The council made another closing order in respect of the house based on another report of the medical officer of health, dated August 31, 1916, and the notice of such closing order was served upon the owner on September 18, 1916; and on serving the notice of "closing order which has become operative" upon the occupying tenant, who, as already stated, was also the owner, on November 20, 1916, it was found that the house was then being further reconstructed, mostly of wood and corrugated iron, and also being enlarged. On account of such reconstruction and extension the medical officer of health made a further inspection of the dwelling-house on December 14, 1916 (a few days before the notice of "closing order which has become operative" expired), and reported: "That it is in a state so dangerous or injurious to health as to be unfit for human habitation, but that the above condition of things is partly due to the fact that the building is in process of reconstruction and enlargement, which process is as yet to a great extent unfinished." He added that, in his opinion, the building could be rendered reasonably fit so that it would not be in a state so dangerous or injurious to health as to be unfit for human habitation, and that the shape and appearance of the dwelling-house was much improved and its cubic capacity much enlarged. The building, as reconstructed of wood, does not comply with the council's by-laws, Article 11, &c., in respect to structure of walls, &c.; but the medical officer of health suggests that the Local Government Board now countenance a different standard of houses, irrespective of stability or prevention of fire around rural parts, such as the locality in which the dwelling-house in question is situate. Having regard to his reports, already referred to, and the result of an interview which the council had with him, it is doubtful whether he would be prepared to give such evidence as would ensure an order against the occupying tenant to quit the house. Your advice as to the best procedure to be taken by the council in the matter is requested. The following alternatives are suggested: (*a*) That if after the reconstruction is completed the medical officer of health reports that the house is still unfit for human habitation, a closing order be made. (*b*) Whether the building now being reconstructed can be treated as a new building, and, if so, the owner may be summoned for not submitting plans, as required by Article 92 of the by-laws, or dealt with under Article 99, by giving him notice to show sufficient cause why such building should not be removed or pulled down—the old house was not pulled down to or below the ground floor (*vide* sec. 159 of the Public Health Act, 1875), and the occupying tenant remained there while the reconstruction was being carried out.

In the circumstances I think the better course would be to summon the owner for not submitting plans. It will then be a "question of fact" for the magistrates to decide whether the reconstruction of the house constitutes the erection of a new building within the meaning of the by-laws. If the decision is in the affirmative, the council could then proceed under by-law 99. If the decision is in the negative, and the medical officer reports that the house is still unfit for human habitation, application could be made for an order for the owner to quit.

Extraordinary Traffic.—"J. P." writes: My council are claiming under sec. 23 of the Highways and Locomotives (Amendment Act, 1878) a sum of money incurred by them as extraordinary expenses in the repair of a particular district road. The contractor, although admitting no liability, in order to save the expenses of litigation, offers a sum per ton of timber removed or to be removed over the road referred to. I presume the scale of composition is left entirely to the agreement of the parties, but can you, for my guidance, inform me of any such basis adopted in such cases, particularly the amount per ton agreed on, and whether the weight of the engine and trucks is usually included in the tonnage? You will note that the offer here is not so much per ton per mile; but perhaps you are able to inform me of a figure adopted by other councils on this basis, or otherwise refer me to such councils direct?

The amount of composition is a matter entirely for the parties to agree upon. Sec. 23 of the Highways and Locomotives Amendment Act, 1878, gives them a free hand, and enables them to deal with damage to a road either prospectively or retrospectively. I am not aware of the basis of composition usually adopted, and should think it would depend upon the particular circumstances of each case.

The Emptying of Cesspools.—"W. L. F." writes: My council, for some years past, have undertaken the emptying of certain cesspools within their area at the cost of the rates. The number of cesspools so emptied is about 75 per cent of the whole, the remainder being emptied by the owners at their own expense. The cesspools of all new houses are emptied by the council at the cost of the ratepayers. The owner of an old house having a cesspool which has hitherto been emptied by the owner now requests the urban council to undertake the emptying, and I shall be obliged if you will kindly let me know—(1) If the council must undertake this work at the cost of the ratepayers? (2) If the council can legally charge the owner or occupier the cost of this work?

(1) The council can undertake the cleansing of cesspools for the whole or part of their district, but it is doubtful whether they can restrict the undertaking to particular cesspools to the exclusion of others. See *Pegg & Jones, Limited*, v. *Derby Corporation* (73 J.P., 413). If the undertaking applies only to part of the district, and the house in question is not situate in that part, the council would not be bound to employ the cesspool; otherwise they would. (2) In my opinion the council have no power to make and enforce any such charge.

Building Line: Public Health (Buildings in Streets) Act, 1888, Sec. 3.—"Lineal" writes: A builder has submitted a plan of a house which he proposes to erect at the junction of two streets in this (urban) district, the main entrance to the house being in one (the principal) street, and the side entrance in the other (side) street. At a distance of about 60 ft. from the back wall of the proposed house there is a row of a dozen small cottages, fronting on the side street and set back 10 ft. from the street boundary. The proposed house (according to the plan) abuts upon the footway of the side street. Will you please inform me whether the council can require the house to be set back to the line of the cottages—viz., 10 ft.?

In my opinion the house is in both streets for the purposes of the Act, and the cottages are sufficiently near it to be on one side thereof within the meaning of the section, and consequently the council can require the house to be set back 10 ft. to the line of the cottages, in conformity with the Act. See *Wilson* v. *Maitland* (56 J.P., 502).

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars have reached us during the present week. Other reports will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Baildon U.D.C.—It has been decided to erect a public convenience at Panfold Hill by agreement with the Bradford Town Council as owners of the land.

St. Austell U.D.C.—The council have agreed to a scheme for the erection of an isolation hospital for twenty beds.

HOUSING AND TOWN PLANNING.

Atherton U.D.C.—Plans have been approved showing the lay-out of the site at Collier Brook Farm for the erection of working-class dwellings.

Edinburgh T.C.—With respect to the housing of Rosyth workers, the Lord Provost's sub-committee have expressed the opinion that the reconstruction of shops and offices into dwelling-houses would not meet the case. The only result of such a step would be to depreciate the value of the property so treated. So far as the overflow of people from Rosyth was concerned, it was felt that the Admiralty must first move in the matter of accommodating them before the corporation could do anything. Once the authorities made a start the city would give every assistance. A conference between the Admiralty and the city officials would be arranged as soon as possible.

Glasgow T.C.—The Special Committee on Housing and General Town Planning Improvement have agreed to the appointment of two outside architects, known to be capable of dealing with the subject of the housing of the working and poorer classes, and with general town improvement, to act in conjunction with officials of the corporation in the consideration and submission of plans of the city in connection with the proposed erection of sanitary dwellings for the working, labouring, and poorer classes, and the demolition of slums. It has also been agreed to proceed with the building of twenty or thirty tenements, in reasonable proximity to the most necessitous districts of the city, on ground either in possession of the corporation or to be acquired by them at a cheap rate.

Huddersfield T.C.—Application is being made to the Local Government Board for borrowing powers in connection with a scheme for the provision of 186 working-class houses.

Irvine T.C.—The burgh council are considering a scheme for the erection of working-class dwellings.

MOTOR TRANSPORT.

Bath T.C.—The city council have deferred the question of purchasing a new motor fire engine. Messrs. Shand, Mason & Co. wrote that they could not tender as requested owing to being on Government work, and Messrs. Dennis Brothers, Limited, were unable to tender to the specification submitted, but would quote for a vehicle fitted with a turbine pump, if so desired.

Brighton T.C.—Two motor vehicles are to be purchased for street watering and haulage.

Chipping Sodbury R.D.C.—The council will consider the purchase of a tractor at their next meeting.

Folkestone T.C.—It has been agreed to purchase a "first aid" fire motor at a cost not exceeding £250.

Sedgley U.D.C.—A steam tractor which was to have been delivered to the order of the council has been requisitioned by the Government.

Sudbury R.D.C.—The council are seeking to join with the Cavendish Urban and Rural Councils for the purchase of a motor fire engine for the use of the three districts.

ROADS AND MATERIALS.

Chislehurst U.D.C.—It was reported that the county surveyor had agreed that the county council would defray the cost of repainting the posts of the motor signs which are fixed on the paths and likely to be a source of danger to the public.

Deptford B.C.—The Works Committee are recommending the borough council to purchase a tar-spraying machine at an approximate cost of £100.

Headington R.D.C.—The surveyor, Mr. A. Walker, has submitted an estimate of £1,017 for the repair of the Cowley-Littlemore road, which has been badly damaged by motor-'bus traffic.

Lindsey C.C.—The council have approved a report of the Highways Committee recommending that the district councils from and after March 31 and until April 1, 1918, should undertake the maintenance and repair of all the main roads situate within their respective districts, except main roads now directly maintained by the councils, and also to undertake such improvement and enlargements of and other dealings with all or any of the main roads, and such new works upon the main roads as may from time to time be sanctioned by the committee, but not further or otherwise.

Manchester T.C.—The town council have received the following resolution from the Manchester and Salford Social Welfare League: "That the Social Welfare League, while understanding the difficulties of effective work during the present abnormal period, believes that much could be done to improve the condition of Manchester streets by the adoption of mechanical appliances, and by organising a new body of gleaners as suggested by the Women's Citizens' Association; and the league trusts that the Cleansing Committee will give its best consideration to the practical proposals which the Women Citizens have made."

Mansfield T.C.—The town council have intimated to the Road Board that they will be prepared to contribute a moiety of the estimated cost (£985) for the repair of Sherwood-road.

Newry U.D.C.—Tenders are being invited for 2,000 tons of broken stone for the repair of the town streets.

Newton Abbot R.D.C.—The War Office have written that they are unable to supply prisoners of war for the roads, as there is such a demand for them for other work.

Notts C.C.—A report of the Highways and Bridges Committee, presented at Tuesday's meeting of the county council, contained the following list of improvements which it is proposed to carry out after the war: Resurfacing of county main roads: Nottingham to Newhaven, $8\frac{3}{4}$ miles. Mansfield to Derby, $7\frac{3}{4}$ miles. Newark to Gainsborough, $4\frac{1}{2}$ miles, £26,250; Nottingham and Loughborough main road, improvement to Bunny Hill, £3,000; resurfacing the remaining portion of the Fosseway between Newark and Lincoln, £8,000; Nottingham to Newhaven main road, Middlebrook Hill, £1,000; Newark to Lincoln, Fosseway near Leicestershire county boundary, £6,000; new communication, Nottingham to Bawtry-road, £39,600; total, £83,850.

Omagh R.D.C.—The county surveyor, Mr. Leebody, submitted an estimate of £16,945, an excess over the limit of expenditure of £3,909. The estimate was rejected by the council, and the limit of expenditure fixed as before at £13,033. The county surveyor brought forward a proposal to work all the roads in the Fintona district by direct labour instead of by contract, and stated this was the only alternative to the council increasing the limit of expenditure. He hoped by direct labour to be able to continue the work without increased expenditure. The council, however, decided in favour of the contract system, and rejected the proposal.

Rutland C.C.—The council have directed the Oakham Urban and Rural District Councils and the Uppingham Rural District Council to undertake the maintenance of the main roads in their respective districts for another year, ending March 31, 1918, at the following sums: £130 per mile for the Oakham Urban District, and £60 per mile for the Oakham and Uppingham Rural Districts, with an additional £50 for the main roads in the parish of Uppingham.

St. Ives T.C.—The continuation of the Wharf-road improvement and the proposed construction of a slip-way is engaging the attention of the council.

Settle R.D.C.—The surveyor, Mr. W. A. Stuart, has been instructed to prepare an estimate of the cost of making up Tems-street, Giggleswick.

Uxbridge R.D.C.—The Highways Committee have been asked to consider the question of the employment of German prisoners on the roads.

SEWERAGE AND SEWAGE DISPOSAL.

Aylesbury R.D.C.—The council are asking the county council to take the necessary steps to prevent the floodings at Bierton.

Bolston U.D.C.—The surveyor, Mr. V. Turner, has submitted a proposal for the provision of screening and dredging plant at the sewage disposal works, at an estimated cost of £700. The council have referred the matter back for further consideration.

Easington R.D.C.—A letter was recently received from the Ministry of Munitions declining to grant a licence for the continuation of the Wingate sewerage scheme. Subsequently the Local Government Board were asked to advise the council as to whether the contractors had any legal claim for compensation, and they had replied that the matter was not one upon which they could undertake to advise the council. Next the clerk sent the whole of the information to the Defence of the Realm Losses Commission, and they had replied that the commission would not be prepared to regard any loss suffered in this respect as loss due to specific interference on the part of the Crown, and that they could not undertake to advise the council with regard to the legal position. In the circumstances the council have decided to meet the contractors and have the whole matter discussed.

Hayes U.D.C.—A scheme for the extension of the sewage disposal works at an estimated cost of £5,500 has been submitted to the Local Government Board for approval.

Leake R.D.C.—It was reported that the War Office were putting in a sewerage scheme of their own at the prisoners' camp at Sutton Bonnington.

WATER, GAS, AND ELECTRICITY.

Ashbourne U.D.C.—A site is to be purchased near Clifton-road for a supplemental water supply.

Bolton T.C.—Powers are to be applied for by the corporation to form impounding reservoirs in North-East Lancashire by constructing dams across the Roeburn and Hindburn rivers. Of the two reservoirs proposed on the Roeburn, one is to be formed by a dam in Roeburndale, at a point some 7 furlongs from the Mallowdale Bridge. The other, across the same stream, is to be in Mallowdale. Two reservoirs are also to be constructed on the Hindburn River, and are to be known as the Hindburn and Swans reservoirs. To facilitate the works powers are taken to lay down railways from Hornby Station on the Midland Railway to the reservoir sites, which are some 10 miles distant from Blackburn.

Burnley T.C.—The Electricity Committee are considering a scheme for supplying electricity to the Rose Grove area after the war.

Eccles T.C.—The town council are making inquiries of the Salford Corporation and the Lancashire Electric Power Company as to the terms for the supply of electrical energy in bulk.

Falkirk T.C.—A committee has been appointed to inquire into the question of the extension of the electricity works.

Fulham B.C.—It is intended to instal at the electricity works a centrifugal pump and galvanising hot well for use in connection with the economisers in the boiler house.

Honiton T.C.—It was reported that the gas company had decided to make an allowance of 20 per cent. on their account for public lighting during the past quarter.

Leigh T.C.—The town council have approved the proposal of the Electricity Committee to link up the electricity undertaking with the South Lancashire Tramways Company.

Lytham U.D.C.—Consideration is being given to the provision of two purifiers at the gasworks.

Newton Abbot R.D.C.—It was reported that the negotiations for the purchase of additional land for water supply at Bovey Tracey are proceeding satisfactorily.

Tredegar U.D.C.—The council discussed on Tuesday the Ebbw Vale Water Bill, and decided to lodge a petition in opposition to it unless a clause was inserted leaving the charges for water in the Sirhowy district on the present basis.

Uxbridge U.D.C.—The council have resolved to give notice of objection to the new powers being applied for by the Rickmansworth and Uxbridge Water Company. It was stated that under the proposed new Order the company wanted the power to open up connection pipes when they thought fit, and to charge the cost to the consumer.

Willesden U.D.C.—The council are recommended to take up a loan for the extension of the electricity mains and the provision of transformers.

MISCELLANEOUS.

Leicester T.C.—The Estates Committee reported that under the powers of the Cultivation of Lands Order they had taken possession on behalf of the council of over 80 acres of unoccupied land. Up to the present 960 persons had undertaken to work upon the land taken over.

Tynemouth T.C.—It was reported on Wednesday that the Watch Committee were considering the condition of the fire brigade, and that they were determined to have "a proper reorganisation from top to bottom."

Wellington (Salop) U.D.C.—The works proposed to be carried out during the year include a 16-in. diameter borehole, pumping station, and refuse destructor, at an estimated cost of £7,500; new sewers at Station-drive, Market-street, and Bridge-road, at an estimated cost of £7,000; and a public convenience at Station-drive.

PERSONAL.

Mr. G. Prout, surveyor to the Wiveliscombe (Somerset) Urban District Council, has resigned, owing to ill-health.

Mr. J. W. Lupton, highways surveyor to the Flaxton Rural District Council, has been voted a bonus of £10 per annum.

Mr. T. Harold Davies, surveyor to the Oswestry Rural District Council, has received a commission in the Royal Engineers for road work in France, and the council are advertising for a temporary surveyor.

Mr. W. Truscott, acting highway surveyor and assistant sanitary inspector to the Liskeard Rural District Council, has been placed on the list of applicants for a commission, and the council are advertising for a surveyor for the duration of the war.

Mr. R. Bruce Gray, surveyor to the Selby Urban District Council, has received a commission in the Roads Battalion of the Royal Engineers, and Mr. R. Penty, of Selby, has been appointed acting surveyor and sanitary inspector during his absence.

Mr. Wm. Nisbet Blair has received the congratulations of his council upon his twenty-five years' service as borough engineer and surveyor of St. Pancras.

Mr. S. A. Bennett, Assoc.M.Inst.C.E., who for some years has been deputy surveyor of Monmouthshire, is recommended by the Main Roads and Bridges Committee of the county council for the post of county surveyor in succession to the late Mr. William Tanner. The salary is £450, rising to £500 per annum.

Mr. W. Baker, chief water inspector of the Doncaster Corporation for the past five years, was recently presented by Mr. R. E. Ford, acting borough surveyor, with a double gold albert subscribed for by the officials of the department. Mr. Baker has accepted an appointment under the Sheffield Corporation water department.

Mr. A. Tillotson, borough surveyor of Honiton, has been called up for road making in France, and the town council have agreed to make up the difference between the Army allowance and his salary. Mr. W. B. Cox, jun., has been appointed in his absence to act as sanitary inspector and water bailiff, and Mr. W. B. North as inspector of the roads.

Mr. S. S. Gettings, Assoc.M.Inst.C.E., surveyor to the Tring Urban District Council, who has been appointed surveyor and sanitary inspector to the Dorking Urban District Council, began his professional career as an articled pupil to Mr. A. D. Greatorex, M.Inst.C.E., borough engineer and surveyor

of West Bromwich, after which he was appointed assistant in Mr. Greatorex's office. Subsequently he held the following appointments—viz.: 1901-1902, assistant engineer to Messrs Willcox & Raikes, civil engineers, of Birmingham; 1902-1906, chief assistant borough engineer and surveyor of West Bromwich; 1906-1907, resident engineer to the Campden District

Mr. S. S. Gettings,
Dorking's New Surveyor.

Council; 1907-1909, resident engineer to the Tring Urban District Council; and 1909 to present date, surveyor to the Tring Urban District Council. During his nineteen years of professional work he has had a varied and practical experience in road construction, and—at West Bromwich and Campden—the preparation of plans and the supervision of the construction of many public buildings and works. As resident engineer at Tring he supervised the construction of the main sewerage and connections of the west end of the town, while as surveyor and inspector of nuisances he has carried out many important road and other schemes.

OBITUARY.

Mr. Walter Wrennall, assistant water engineer to the Corporation of Cape Town, died on January 9th while on active service in German East Africa. He was four years the assistant building surveyor in the same service. Prior to going to South Africa he was engaged at Willesden, and for many years was chief assistant to his father, who has an estate business in Liverpool. During his service with the S.A. Field Artillery he proved himself an excellent officer.

Birmingham Tramways Undertaking.—At a meeting of Birmingham Tramways Committee it was stated that, owing to the recent stoppage of the tramway service, no contribution in relief of rates was possible. Last year £50,000 was available.

FOR OTHER ADVERTISEMENTS
See End of Paper.

HASLEMERE URBAN DISTRICT COUNCIL.

HASLEMERE WATERWORKS

The above Council require the services of a man, ineligible for military service, to generally assist at their Water-pumping Station.

Salary 25s. per week, with house, fire and light.

A [illegible] possess some knowledge of gas-engines.

Applications, in candidate's own writing, accompanied by copies of three recent testimonials, to be delivered to the undersigned on or before Friday, February 9th, 1917.

A. C. WHITCHER,
Clerk to the Council

[illegible]
Haslemere.
Surrey.
January 31, 1917. (3,284)

TRING URBAN DISTRICT COUNCIL.

SURVEYOR, INSPECTOR OF NUISANCES, &c.

Applications are invited for the appointment of Surveyor, Inspector of Nuisances and Canal Boats, and Inspector of Petroleum to the Council, the population of whose District is about 4,500, and the area 4,354 acres. The duties include the collection of the rents of the Council's property, consisting of 56 cottages. The person appointed will be paid an inclusive salary, commencing at £150 per annum. He will be required to reside in Tring, and to devote the whole of his time to the duties of the office.

Canvassing is prohibited, and will be considered a disqualification.

Applications, in candidate's own handwriting, marked "Surveyor," and stating age, qualifications, experience, position with regard to military service, and when able to take up duties, with copies of not more than three recent testimonials, to be received by me not later than Monday, the 12th instant.

A. W. VAISEY,
Clerk to the Council.

Tring.
February 2, 1917. (3,285)

TOTNES RURAL DISTRICT COUNCIL.

HIGHWAY SURVEYOR.

The Council require the services of a Highway Surveyor for the No. 2 District, at a salary of £130 per annum. Particulars of the terms upon which the appointment will be made may be obtained from the undersigned. Applications, in candidate's own handwriting, stating age and experience, with copies of three testimonials of recent date, to reach me not later than 9 a.m. on Wednesday, 14th February next. Jno. S. Portch, Deputy Clerk to the Council, 19 High-street, Totnes. January 27, 1917. (3,285)

BRIDGNORTH RURAL DISTRICT COUNCIL.

The above Council invite Tenders for the Supply of Granite and Slag, delivered at various Stations and Wharves in the District, for the year ending March 31st, 1918. Tenders to be sent in not later than the 22nd February to the undersigned, from whom Forms of Tender and particulars may be obtained.

F. RICHARDS,
Surveyor.

Bridgnorth.
January 31, 1917. (3,283)

COUNTY BOROUGH OF BELFAST.

WORKS DEPARTMENT.

TENDERS FOR STORES, WORK, AND UNIFORM CLOTHING.

The Works Committee are prepared to receive Tenders for the Supply of the following Stores, Work, and Uniform Clothing for the year, commencing 1st April, 1917:—

Earthenware Sewer Pipes.	Shovels, Spades, Graipes and Buckets.
Timber.	Scavenging Brushes.
Slates.	Glazed Bricks.
Hardwood.	Artificial Flags.
Iron Castings.	Lime.
Plumbers' Work.	Pitch, Felt, Tar, &c.
Nails, &c.	Sea Sand, Sea Gravel, and Lough Neah Sand.
Iron and Steel.	Cement.
Paints, Oils, &c.	Uniform Clothing and Hats.
Glazing.	
Mill Furnishings.	

Forms of Tender and particulars may be obtained from Mr. Hector F. Gullan, M.Inst.C.E., Superintendent of Works, City Hall.

Sealed Tenders, on official Forms only, endorsed "Tender for ——, Works Department," to be lodged in my Office before 12 o'clock noon on 13th February.

The lowest or any Tender will not necessarily be accepted.

The whole or any part of a Tender may be accepted.

An official receipt must be obtained for every Tender delivered by hand. Tenders sent by post must be registered.

R. MEYER,
(3,287) Town Clerk.

SECOND HAND Small Sludge Press Wanted. State size and particulars.—Box 1,693, office of The Surveyor, 24 Bride-lane, Fleet-street, E.C. (3,286)

War-Time Economy in Newport, Isle of Wight.

By E. A. SLATER, F.S.I., ASSOC.M.INST.C.E., Borough Surveyor and Water Engineer.

This war has not been altogether an unmixed curse; many of us have been driven by the pressing need of economy and the shortage of material to leave the beaten path of municipal work and attempt, with more or less success, to economise in new directions.

to try experiments which we should not have bothered about in normal times.

REFORMING ROADS INSTEAD OF RENEWING.

Referring to road repairs as an example, in the ordinary way, when the carriageway is worn, it is scarified and a layer of new macadam is spread and rolled. But supposing one has no granite or broken stone, and has no prospect of getting any, except at a fancy price. That has been our case; the only firm that tendered last February were unable to supply on account of war restrictions.

To repair granite with local gravel would, of course, have been a retrograde step. Two sections of a main central road had got in a bad state with deep potholes, and as stone could not be obtained, I decided to make them up without stone.

I will call one Section A. This was about 20 ft. wide, with a very steep crossfall, so steep that the

traffic naturally clung to the centre, wearing it into ruts, and there was still a fair amount of granite left on the boundaries. We just tore it up with a scarifier, lifted the granite and stacked it along on both sides. Then it formed the surface, as shown in Fig. 1, retaining the contour as much as we dared so as not to cut too deeply into the existing foundation in the centre. We then respread the old macadam, adding the boundaries somewhat to feed the crown, the only extra material being the binding gravel.

We may say that the least amount of material used was a minus quantity, as waste material was removed that supplied quite a good surface was obtained ready for the patent Mag coat which tar-painting adds to the road.

Section B was similarly treated, except that here the cross-section was not unduly steep, and the crown had been hollow. After lifting the macadam the contour was built up with coarse local gravel and rolled before re-spreading the granite. The cost was as follows: Section A, 2½d. per sq. yd.; section B, 3½d. per sq. yd.

COMPOUND ROADS.

Stone kerbs and setts must now be scarce and costly. Not that I have tried to buy any for years. Fortunately, there are many granite-sett crossings in this town, so that when we want any stone for kerbing or other purposes we go and dig up a crossing and put tar-macadam in its place. The crossing sweeper of early Victorian pre-tar-macadam days has disappeared, but the granite-sett crossing is still with us, and, although it resists the heaviest traffic, it has a nasty knack of causing the destruction of the road on each side of it. So I prefer to reverse the arrangement, taking out the transverse crossing and laying the setts longitudinally in narrow roads to form watersets.

Fig. 2 is a section of a road recently treated in this way, setting material from old crossings; and this is what I would call a compound road.

There has been some discussion lately on the method of laying setts. A prevalent idea is that they should be laid on concrete with an intervening layer of sand, which is supposed to act as a cushion. For some time past I have preferred to lay them not *on* but *in* the concrete, avoiding the laborious and tedious ramming with the heavy wooden rammer. The surface of the concrete foundation is kept a trifle full, the upper part being mixed with fine aggregate, and the setts merely tapped down with a hammer into the wet concrete till they come to the required level, so that the concrete comes up between the joints.

By this method old granite setts of varying depths can be used, no matter how irregular in shape they may be, provided that the top face, one only out of the six faces of each stone, is dressed. The wide, irregular joints are then determined when flushed up with cement grout, for which the screenings of shingle containing sand and grit up to ¼-in. gauge is better than ordinary sand. The concrete should be in two layers, and the bottom layer allowed to set partially before the top layer is applied, to avoid getting a spongy mass. If the top layer is very fine and mixed fairly wet, it will rise better between the setts.

I have found this construction to be successful under the heaviest traffic, and I think the practice ought to prolong the life of the road.

Let us compare the two methods, neglecting the supposed effect of the cement grouting in the joints, common to each. With the sand cushion the blow of a traffic engine which may come on to a single sett, and instantly transmits the blow to an area of concrete [illegible] But under the concrete foundation the granite setts are as one solid block of stone, the granite setts acting as a protecting surface against abrasion, one part cannot move separately from the other, and the combined structure has a power to distribute heavy loads over the subsoil practically through the depth obtaining under the old macadam method. It must be less liable to subsidence, a result gained simply doubling the depth of a girder [illegible] its effective.

With a treacherous subsoil it may be advisable still further to distribute the effect of the load by reinforcing. But in these times it should not be necessary to go to the expense of any patent system. I have a headstock bed and bedstead laths for this purpose at about £2 a ton, but feel better soil needs [illegible] may go up.

[illegible] The setts are laid with their [illegible] of the road, so as to avoid running [illegible] too much for wheels each [illegible] In this case the centre was finished with ordinary macadam to give better foothold to horses, and as the road was so narrow I thought it best to finish the width between the wheelers and the kerb on each side in concrete, as shown. In some cases, with a slow, heavy horse traffic, it would be advisable to treat the centre in the same way.

This is really, in effect, applying the principle of the railway track to roads, and it is a system which could, I believe, be applied with advantage to roads in France. Four of these tracks, corresponding to a double line of railway, could be made to withstand the severe stress of heavy artillery and lorries, which, combined with long-continued rain, must be too much for anything of the nature of tar-macadam. An objection might be made in regard to the time required for this work to set, but a week or so is not a long time—unfortunately—in this war. This system is also suitable for roads split up by tramways, where we get room for a single row of vehicles, or a little more perhaps, on each side, and on an incline. The space between the wheelers should be finished in macadam.

Fig. 3 shows another very narrow road, to be treated in the same way, which passes over an old brick-arched bridge. This bridge has recently become dangerous, and I propose to strengthen it by digging two longitudinal trenches down to the lowest ring, about 18 in. wide, leaving this ring in to save centering, and fill it with concrete reinforced with bedstead laths or otherwise, so forming two main girders under the wheels, which would also support the concrete layer to be spread over the whole surface.

This seems to me to open up a wider question. I have come to the conclusion that in the past we have been working on wrong lines in the construction of granite sett roads, with the result that they have got into disfavour on account, mainly, of their excessive noisiness.

I have been looking at this section of compound road which I have described, and which was laid about six months ago. The surface of the setts when laid was somewhat uneven, being old setts, roughly dressed by the mason. Now the surface of each track is quite smooth, and I should think almost as frictionless as railway metals. There has been constant traffic of heavily loaded fast-travelling Fodens (about 12 tons a time), and, owing to the unyielding nature of the bed, due to the tapping in wet concrete system, the rough edges or corrugations of the surface have been worn off by the cast-iron wheels, and now, although there will be necessarily a certain amount of wear, it will be approximately no more than that of a single solid block of granite. Cast-iron wheels will wear it gradually, because cast-iron is harder than granite, but heavy motor vehicles with rubber tyres could no more affect it than the housemaid could wear out a pane of glass by rubbing with her duster. There is no more noise than with a macadam road in good condition, and there must be a minimum of wear, because there is a minimum of resistance, due partly to the bed and partly to the longitudinal laying of the setts. The old setts used ran from 5 in. to 7 in. deep, but with new setts a depth of 3 in. to 4 in., according to the nature of the traffic, should be sufficient.

In future I should always recommend setts to be laid longitudinally (except for steep gradients), and it is a question whether it would not be advisable also for wood blocks (if properly bedded). We should get easier running, and should reduce that which is often the cause of trouble, the lateral expansion in wet weather between kerb and kerb.

CROSSINGS.

Fig. 4 shows what I consider to be the best construction for a footpath crossing. The usual method here, and in many towns, is to provide a heavy cast-iron plate, bridging over the channel, bearing on rebated stone borders. The chief objections are that the plates are apt to get broken, they work loose by the wearing of the rebates, and they harbour dirt. But they are preferable to the dropped crossing, which is especially dangerous now with little or no lighting. We have to study two conflicting interests, and generally a clear, uninterrupted path for pedestrians should be the first consideration and of greater importance than the provision of easy passage for the more occasional crossing of vehicles.

The method shown is a fair compromise; the rise from the channel can be obtained in a width of about 15 in., so that pedestrians can cross on the level, unless they walk too near the kerb. For heavy vehicles there could be a double row of granite setts, as suggested for narrow roads, but for ordinary carts or

rubber-wheeled motors all concrete would be quite good enough. A mould for making quadrant kerbs, as shown, about 4 in. deep, is a good investment.

Fig. 5 is a detail of a kerb and channel. For narrow streets and where there is a probability of wheels grinding the kerb, old deep granite setts may be used instead of concrete, and the sides of the channels we cut out of old Purbeck paving stone, 3 in. thick or over, and tap them into the wet concrete, as before. The space between these and the kerb is filled in with fine concrete, finished off with 1 in. thickness of ¼-in. granite and cement, 3 to 1.

This seems to me to be the correct solution. There is a minimum of worked stone, and that is mostly on the face and second-hand, so we get in effect a single block of material with a hardened face to resist abrasion, and a clean channel.

RAIN-WATER CONDUITS ACROSS FOOTPATHS.

These have usually been made of cast-iron half-round channels, with loose cast-iron covers, which are apt to break and work loose, and cost about 2s. 6d. per foot.

Fig. 6 shows the method which I now adopt at about one-third the cost. Fine concrete is tucked round a wood roll mould, and the hollow bridged-over with thin sheet iron, or old slates will do as well, if handy, leaving about 1 in. thickness of fine concrete over, and an uninterrupted path. A loose plate, as shown, next the wall gives access for cleaning.

INSPECTION PIT COVERS.

We now make drain inspection pit covers of concrete, with two ¾-in. irons bedded in for handles, as shown in Fig. 7. I prefer these covers bedded in mortar to the ordinary so-called airtight cast-iron covers. In nine cases out of ten on inspection it will be found that the cover is not airtight, that the fat or grease that may have been used to make it so is not there, or has been displaced. This is another of the many examples where concrete can take the place of iron with advantage.

FENCING.

Fig. 8 shows a cheap kind of fence put up in place of an old fence. The feet of the old posts had rotted, and were cut off and the upper parts utilised for the new fence, secured to the low concrete retaining wall by old cart tyres, as shown, so that there is no buried timber. The cart tyres make a more rigid and effective connection of the post to the concrete than a central dowel on account of their higher moment of inertia for the same weight of metal. The palings were removed from elsewhere, and the only new woodwork required was the 4-in. by 2-in. rails, which, it will be seen, are merely lapped and nailed to the posts, instead of being tenoned and so weakening the posts, and the palings drip clear of the concrete wall. I prefer all concrete, but now is hardly the time for laying money out on shuttering at the present price of timber, and an unreasonable price is being asked for cement. An economical fence, suitable for enclosing ground for potato growing, a subject very much to the fore just now, can be made with old boiler tubes driven in, in place of wood posts, and drilled for wire to pass through and for hooks to hold barbed wire.

A recent article by Mr. Percy Boulnois referred to the possible saving in fuel in municipal works. I believe that much can be done in that direction, and I have been able to reduce the cost of fuel at the outfall works by 100 per cent by using inferior fuel, such as breeze and waste screenings from a gas-producer plant, at times when full power is not required. Such fuel can be mixed with coke for a heating apparatus, and the finest screenings can be made into briquettes with tar. But this is a commercial economy, and I intended referring only to constructional matters in this article.

It will be seen that this paper deals only with small works of a small town, but whenever we find out any economical methods, or what we believe to be economical methods, my opinion is that we should not hug them at a time when economy is so essential, but pass them on for what they are worth, so that they may be adopted or criticised by others.

London Main Drainage System.—At a meeting of the Institution of Civil Engineers to be held on Tuesday next a paper, entitled "The Main Drainage System of London," will be read by Mr. G. W. Humphreys, the chief engineer to the London County Council. The chair will be taken at 5.30 p.m.

HIGHWAY AND SEWERAGE WORK AT SHEFFIELD.

(From a Correspondent.)

Municipal work in Sheffield is being cut down to the least possible figure. Highway work will, as far as possible, be confined to repairs and maintenance, though it will be understood that, even under present financial conditions, a great deal has to be done to keep the 400 miles of roads within the city in a state to carry the present abnormal traffic.

When the war ends, and such conditions as may be considered normal after the war are reached, a heavy expenditure will be necessary.

Thanks to the Road Board, Sheffield was fortunate in getting most of its outlying main roads resurfaced before the war, and these are standing the traffic remarkably well.

The chief trouble is with the paved roads, many of which have been seriously injured by the numerous steel-tyred tractors at present employed.

Sewerage work has come almost to a standstill, and private street works, upon which an average expenditure of £30,000 has been necessary for some years past, are suspended.

The traffic on the tramways is at present enormous, and when the war is over there is no doubt very heavy renewals will be necessary.

The expenditure of the department last year amounted to £153,649 (as against £238,808 for the preceding year), the figures for the coming year will not materially differ.

The expenditure on highways amounted to £38,877, as against an average of £78,685 for the five years preceding the war.

Timber, Plywood and Woodwork.—We would direct the attention of our readers to the full-page advertisement of Messrs. C. Jennings & Company, of Pennywell-road, Bristol, which appeared in our issue of last week. The information given in the advertisement should be of the greatest value to all users of timber, plywood or woodwork. We understand that the firm are prepared to answer any questions relating to the materials of which particulars were supplied, or furnish prices delivered to any part of the world, either of goods mentioned in the announcement or of others not included in it. They inform us that they hold stock at their branches and warehouses at Porthcawl (South Wales), Leyland and Pembroke Dock, Leicester, Swansea, Hull, Liverpool, Manchester, Newcastle and other places, and will be pleased to receive inquiries.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

DISTRICT ROAD SURVEYOR.—February 3rd.—Oswestry Rural District Council.—Mr. Charles H. Bull, clerk, Rural Council Offices, Oswestry.

TEMPORARY ROAD FOREMAN.—February 5th.—Merton and Morden Urban District Council. £2 15s. per week.—Mr. G. Jerram, engineer and surveyor, Council Offices, Kingston-road, Merton, Surrey.

TEMPORARY SURVEYOR AND INSPECTOR.—February 6th.—Ruislip-Northwood Urban District Council. £200 a year.—Mr. Edmund R. Abbott, clerk, Council Offices, Oaklands Gate, Northwood, Middlesex.

ENGINEERING FITTER.—February 8th.—Gosport and Alverstoke Urban District Council. £2 7s. 6d. per week.—Mr. H. Frost, surveyor, Council Offices, Gosport.

TEMPORARY QUALIFIED ASSISTANT.—February 9th.—Mr. F. Wilkinson, borough engineer, Town Hall, New Cross-road, London, S.E.

TEMPORARY SURVEYOR AND SANITARY INSPECTOR.—February 12th.—Sherborne Urban District Council.—Mr. H. J. Seymour, clerk, Sherborne, Dorset.

SURVEYOR.—February 14th.—Totnes Rural District Council. £130 per annum.—Mr. J. S. Portch, deputy clerk 19 High-street, Totnes.

SURVEYOR'S ASSISTANT.—February 14th.—Aldershot Urban District Council. £2 2s. per week.—Mr. D. Llewellyn Griffiths, clerk.

HIGHWAY SURVEYOR.—February 14th.—Liskeard Rural District Council.—Mr. A. de C. Gubb, clerk, Council Offices, Liskeard, Cornwall.

INSPECTOR OF NUISANCES.—February 17th.—Chatham Local Board. £200–£250.—Mr. J. Holgate, medical officer of health, Town Hall.

SANITARY INSPECTOR.—Government of Nigeria. £250–£300.—Crown Agents for the Colonies, 4 Millbank, Location, S.W.

STOREKEEPER.—Sheffield Corporation Water Department.—Mr. William Terrey, general manager, Water Department, Town Hall, Sheffield.

MUNICIPAL CONTRACTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, but those responsible for their despatch are recommended to arrange that they shall reach The Surveyor office by noon on Wednesdays to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

Buildings.

SHEFFIELD.—February 6th.—For the erection of a transformer sub-station, for the Electric Supply Committee.—The Manager, Commercial-street, Sheffield.

LOUTH.—February 28th.—For the erection of bathrooms at the county infirmary.—Mr. V. J. O'Connell, architect, Eastgate, Louth.

Engineering: Iron and Steel.

WOODFORD.—February 6th.—For the supply and erection of two 15–16 b.h.p. gas engines (Crossley, National, Stockport, or Tangyes), and two Stereo-plunger pumps, at the eastern sewage works, for the urban district council.—Mr. W. Farrington, surveyor, Council Offices, Woodford Green, Essex.

FRESHWATER, I.W.—February 10th.—For repair of the esplanade, for the parish council.—Mr. J. Gilbert, clerk, Attabella, Heathfield-road, Freshwater, I.W.

GLASGOW.—February 19th.—For the supply of gas-cookers and grillers, for the corporation.—Mr. A. Wilson, 15 John-street, Glasgow.

Mechanically Propelled Vehicles.

MANCHESTER.—February 6th.—For the supply of a light motor van, for the Board of Guardians.—Mr. J. Macdonald, clerk, Union Offices, All Saints, Manchester.

MANCHESTER.—February 9th.—For the supply of an electric tipping wagon, for the Electricity Committee.—Mr. F. E. Hughes, secretary, Electricity Department, Town Hall, Manchester.

MANCHESTER.—February 19th.—For the supply of [illegible] sweeping machines, for the Cleansing Committee.—Mr. R. Williamson, superintendent Cleansing Department, Town Hall.

WATERFORD.—For the supply of a high-pressure steam-propelled motor tractor, or light compound motor traction engine, and four suitable tipping wagons, new or second-hand, for the county council.—Mr. [illegible], surveyor, Dungarvan.

Roads.

EAST RIDING.—February 5th.—For the supply of about 2,000 tons of stone for macadamising the main roads, for the county council.—The County Surveyor, Beverley.

LITTLE HULTON.—February 5th.—For the supply of broken granite, 4 by 2 granite, tar-macadam, [illegible] and [illegible] chipping, etc., for the Chamber [illegible] and [illegible] road rolling for the urban district council.—Mr. J. H. Hesse, clerk, Council Offices, Little Hulton, Bolton.

SUNBURY-ON-THAMES.—February 5th.—For the supply of about 1,000 tons of ordinary tar for the urban district council.—Mr. H. F. Crabb, surveyor, Council Offices.

SUTTON-IN-ASHFIELD.—February 5th.—For the supply of [illegible] and limestone for the urban district council.—Mr. W. Barn, surveyor.

RUGBY.—February 6th.—For supplying horses and carts for road repairs, watering streets, and watering for the ensuing financial year.—Mr. J. H. Sharpe, Estate Buildings, Rugby.

RENFREW.—February 5th.—For the supply of metal, borders, setts, and chippings, for the Upper District Committee.—Mr. R. Drummond, road surveyor, Fairfield, Paisley.

HIPPERHOLME.—February 6th.—For the supply of 2½-in. granite macadam, for the urban district council.—Mr. G. Wharton Thompson, engineer and surveyor, Council Offices, Hipperholme.

SWANSEA.—February 6th.—For the supply of about 12,000 or 15,000 gallons of best quality distilled tar, for the rural district council.—Mr. Edward Harris, clerk, Council Offices, Alexandra-road, Swansea.

MIDDLESEX.—February 7th.—For the cartage of about 7,500 tons of broken stone, 2,000 tons of chippings, about 4,000 tons of gravel, hoggin, and shingle, horsing slop carts, water vans, tarring machines, rotary brooms and scrapers, and the hire of horse, cart and van per day, for the county council.—Mr. H. T. Wakelam, county engineer, Middlesex Guildhall, Westminster, S.W.

STOCKPORT.—February 7th.—For the supply of manual and team labour for paving and repairing carriageways, manual and team labour for mason's work on footpaths, and team labour for carting other materials, for the corporation.—Mr. John Atkinson, borough surveyor, Borough Surveyor's Office, Town Hall, Stockport.

TRING.—February 7th.—For the supply of blast-furnace slag, granite chippings, refined tar, flints, and hoggin, for the urban district council.—Mr. S. S. Gettings, surveyor, Surveyor's Office, Tring.

MIDDLESEX.—February 7th.—For the supply of about 7,500 tons of 2-in. and 1½-in. hand-broken basalt, and 500 tons of ¾-in. clean chippings, for the county council.—Mr. H. T. Wakelam, county engineer, Middlesex Guildhall, Westminster.

LITTLEHAMPTON.—February 7th.—For the supply of distilled tar, for the urban district council.—Mr. W. A. Clegg, engineer and surveyor.

EASINGWOLD.—February 7th.—For the supply of whinstone and slag, for the rural district council.—Mr. F. J. H. Robinson, clerk.

GRAYS THURROCK.—February 8th.—For the supply of 400 tons, or thereabouts, of basalt or granite chippings, for the urban district council.—The Surveyor, High-street, Grays.

BEXHILL.—February 9th.—For the supply of distilled tar, Tarvia, or other compounds for use in tar-spraying, for the corporation.—Mr. T. E. Rogers, town clerk, Town Hall, Bexhill.

REIGATE.—February 9th.—For the supply of granite, flints, Kentish ragstone, tar-macadam, gravel, chalk, haulage, team labour, and tar washing, for the rural district council.—Mr. A. J. Head, surveyor, 48 High-street, Reigate, Surrey.

UXBRIDGE.—February 9th.—For the supply of granite, tarred granite and slag, gravel, flints and hoggin, and haulage, for the rural district council.—Mr. J. W. Harrison, engineer and surveyor, Corn Exchange, Uxbridge.

CAISTOR.—February 9th.—For the supply of about 5,000 tons of granite, about 5,400 tons of slag, about 550 tons of slag chips, and 200 tons of tar-macadam, for the rural district council.—Mr. A. A. Padley, clerk, Council Offices, Caistor, Lincs.

HEADINGTON.—February 10th.—For the supply of the best selected granite, broken and unbroken, and unscreened ½-in. granite chippings, for the rural district council.—Mr. A. Walker, district surveyor, Windmill-road, New Headington.

GLAMORGAN.—February 10th.—For the supply of materials and haulage, for the county council.—Mr. G. A. Phillips, county surveyor, County Hall, Cardiff.

HEMEL HEMPSTEAD.—February 10th.—For the supply of granite, for the corporation.—Mr. W. R. Locke, borough surveyor, Town Hall.

BRIDGWATER.—February 10th.—For the supply of tone and Tarmac, for the rural district council.—Mr. W. H. Cousins, surveyor, Union Workhouse, Bridgwater.

HERTS.—February 10th.—For surface tarring approximately 1,250,000 sq. yds. of main roads with refined tar, for the county council.—Mr. J. S. Killick, county surveyor, County Surveyor's Office, Hatfield.

CORNWALL.—February 10th.—For the hire of steam rollers, not exceeding ten, for a period of one year, for the county council.—Mr. L. D. Thompson, county surveyor, County Hall, Truro.

HERTS.—February 12th.—For the hire of steam and petrol rollers, for the county council.—Mr. J. S.

Killick, county surveyor, County Surveyor's Office, Hatfield.

BIRKENHEAD.—February 12th.—For the supply of granite and Rawtenstall kerbs and channels, Penmaenmawr macadam stone and natural flags, and stoneware pipes, for the corporation.—Mr. C. Brownridge, borough engineer and surveyor, Town Hall, Birkenhead.

BUCKS.—February 12th.—For the supply of clean, hand-picked field flints, for the county council.—Mr. E. Winfield, acting county surveyor, County Hall, Aylesbury.

WALTHAM ABBEY.—February 12th.—For tar-spraying about 75,000 sq. yds. of roads, for the urban district council.—Mr. W. C. Holloway, engineer and surveyor, Town Hall, Waltham Abbey.

NORTHUMBERLAND.—February 12th.—For supplying, breaking and carting stone, for the county council.—County Surveyor, Moothall, Newcastle-on-Tyne.

LONG SUTTON.—February 13th.—For the supply of granite, slag, and granite chippings, for the urban district council.—Mr. S. S. Mossop, clerk, Long Sutton, Lincs.

CLAYPOLE.—February 15th.—For the supply of about 1,800 tons of granite, 1,200 tons of slag, and 140 tons of footpath gravel, for the rural district council.—Mr. C. G. Else, district surveyor, Brant Broughton, Newark.

NEWMARKET.—February 15th.—For the supply of about 1,000 tons of the best broken Leicestershire granite, 1¼-in., 2-in., and 2½-in. gauge, 200 tons of best broken slag, 2½-in. gauge, 500 tons of granite or slag chippings, free from dust, ¾-in. gauge, and 250 tons of ¾-in. tarviated granite chippings, for the urban district council.—Mr. W. H. Eley, engineer and surveyor, Town Hall, Newmarket.

WETHERBY.—February 15th.—For the supply of refined tar in accordance with the Road Board specifications, for the rural district council.—Mr. E. H. Coates, clerk, Rural Council Offices, Wetherby, Yorks.

HORSHAM.—February 17th.—For the supply of about 15,000 gallons of tar, for the rural district council.—Mr. W. Dengate, surveyor, 58 Park-street, Horsham.

THAKEHAM.—February 17th.—For the supply of broken basalt or granite, unbroken flints, and refined tar, for the rural district council.—Mr. W. Forrester, surveyor, Storrington, Pulborough, Sussex.

KINGSBURY.—February 17th.—For the supply of Leicestershire granite and granite chippings, ironstone slag, Derby limestone, broken pit or dug flints, hoggin, shingle cartage, and tar-spraying, for the urban district council.—Mr. R. C. N. Newport, surveyor, Council Offices, Kingsbury, Middlesex.

FORFAR.—February 17th—21st.—For quarrying and carting breaking materials for the highways, for the Forfar district.—Mr. A. Lindsay, 12 Reform-street, Kirriemuir.

WANSTEAD.—February 21st.—For the supply of cartage and team labour, for the urban district council.—Mr. B. Blewitt, clerk.

BOLSOVER.—February 21st.—For the supply of granite, limestone, slag, basalt, tarred limestone, tarred slag, refined tar, pitch, kerb, channel, sand, and stoneware pipes, for the urban district council.—Mr. J. F. Wardle, town surveyor, Council Offices, Bolsover, near Chesterfield.

MARPLE.—February 23rd.—For the supply of granite macadam and chippings, Macclesfield macadam and chippings, 6-in. grit stone setts, and sanitary pipes, for the urban district council.—Mr. D. J. Diver, surveyor, Council Offices, Marple.

ROTHERHAM.—February 24th.—For the supply of granite slag and tarred macadam, for the rural district council.—Mr. R. Bradbury, district surveyor, Imperial Buildings, Rotherham.

MILNGAVIE.—For the supply and spreading of road metal, for the corporation.—Mr. T. M'Intyre, burgh surveyor, Milngavie, Scotland.

Sanitary.

ROWLEY REGIS.—February 6th.—For emptying and removing house refuse, for the urban district council.—Mr. D. Wright, clerk, Council Offices, Old Hill, Staffs.

LEEDS.—February 13th.—For the supply of press filter-cloths at Knostrop sewage works, for the Sewerage Committee.—Sewerage Engineer, Great George-street, Leeds.

BLAYDON-ON-TYNE.—February 13th.—For the removal and disposal of refuse, for the urban district council.—Mr. R. Biggins, Council Offices.

AYLESBURY.—February 17th.—For the collection of refuse, for the rural district council.—Mr. R. T. S. Stewart, sanitary surveyor and inspector, Council Offices, 21 Walton-street, Aylesbury.

SMALLTHORNE.—February 28th.—For scavenging the Packmoor area, for the urban district council.—The Sanitary Inspector, Smallthorne, Staffs.

Stores.

STOCKPORT.—February 7th.—For the supply of Dalbeattie and Welsh granite setts, Welsh granite, broken for macadam, Lancashire lonkey and Lancashire grit setts, flags, kerbs, granite concrete flags, Portland cement, earthenware and stoneware pipes, iron castings, pitch, creosote oil, limestone chippings and lime, for the corporation.—Mr. John Atkinson, borough surveyor, Borough Surveyor's Office, Town Hall, Stockport.

SALISBURY.—February 9th.—For the supply of brushes, refined tar, oils, and disinfectants, for the corporation.—City Engineer and Surveyor, Endless-street, Salisbury.

IRLAM.—February 9th.—For the supply of broken granite, tarred slag, kerbs, setts, stoneware pipes and gullies, cement, hire of steam roller, pitch and creosote oil, disinfectants, scavenging brooms, iron castings, and team labour, for the urban district council.—Mr. R. H. Winterbottom, surveyor, Council Offices, Irlam, Lancs.

HALIFAX.—February 12th.—For the supply of materials for the tramways department, for the corporation.—Tramways Engineer, Tramways Offices, Skircoat-road, Halifax.

BIRMINGHAM.—February 12th.—For the supply of granite kerbs, setts, crossing stones, chippings, flags, paving bricks, wood-paving blocks, ragstone, limestone, tarred limestone, tarred roadstone, gravel, sand, slag, lias lime, Portland cement, and stoneware pipes, for the corporation.—Mr. Henry E. Stilgoe, city engineer and surveyor, The Council House, Birmingham.

CHELTENHAM.—February 14th.—For the supply of clothing, castings, disinfectants, electric light fittings, forage, household goods and sundries, ironmongery, indiarubber goods, lime, bricks and sand, lead pipe, sheet lead and block tin, oils, colours, Portland cement, stoneware pipes, tools, timber, wrought iron, steel and files, for the corporation.—Mr. J. S. Pickering, borough engineer, Municipal Buildings, Cheltenham.

RAWTENSTALL.—February 15th.—For the supply of road metal, earthenware pipes, gullies, timber, pitch, creosote oil, disinfectants, Portland cement (British), iron castings, local stone (flags and setts), workmen's tools, scavenging brushes, horse-shoeing, coal and coke, carting, and team labour, for the corporation.—Borough Surveyor, Town Hall, Rawtenstall.

STOKE-ON-TRENT.—February 17th.—For the supply of various materials and goods for the year 1917-18.—Mr. E. B. Sharpley, town clerk.

STAFFORD.—February 17th.—For the supply of ironmongery, tools, timber, castings, water fittings, stoneware pipes, brooms, cement and lime, bricks, paving setts, road stone, and ironstone furnace slag, for the corporation.—Mr. W. Plant, borough engineer, Borough Hall, Stafford.

DONCASTER.—February 19th.—For the supply of roadstone and setts, kerbstone, flags, slag or furnace dross, tarred slag and limestone, pitch, creosote oil and refined tar, sand and gravel, drainage pipes, blue channel bricks, bricks, cement, brooms, paints, picks and shovels, oils, paraffin, cotton wastes, and disinfectants, for the corporation.—Mr. R. E. Ford, acting borough surveyor, Mansion House, Doncaster.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

* Accepted. † Recommended for acceptance.

MERTHYR.—For supplying and laying 760 yds. of 12-in. and 9-in. stoneware pipes, for the Merthyr and Aberdare Joint Farms Management Committee.

J. Williams & Sons, Merthyr £ [illegible]
J. Murray, Mountain Ash [illegible]
D. Jones, Dawlais [illegible]
Blackburn & Evans, Treharris, Glamorganshire [illegible]
J. Sutherland, Abercynon, Glamorganshire [illegible]

FORTHCOMING MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

FEBRUARY.

5. Institution of Civil Engineers of Ireland. Mr. F. C. Urey on "Recent Practice in the Purification and Softening of Public Water Supplies." 8 p.m.
6. Institution of Civil Engineers. Mr. G. W. Humphreys, M.INST.C.E., on "The Main Drainage System of London." Paper for new members. 5.30 p.m.
7. Town Planning Institute. Prof. S. D. Adshead on "Monumental Memorials and Town Planning." 6 p.m.

APPOINTMENTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

ALDERSHOT URBAN DISTRICT COUNCIL.
SURVEYOR'S ASSISTANT.

The Committee of Urban District Council of Aldershot invite applications for the above appointment, for a period not exceeding the duration of the War. The engagement will be terminable by one month's notice on either side.

Salary, £2 2s. per week.

Candidates for the position should have had experience in the use of Surveying Instruments, Plotting, the routine of a Surveyor's Office, the preparation of Architectural Drawings and Designs, the Inspection of New Buildings and Drainage Works under the Council's By-laws, and the preparation of Specifications.

The candidate appointed will be required to devote the whole of his time to the service of the Council.

Applications, in candidate's own handwriting, stating age, whether married or single, previous experience, present employment, and accompanied by not more than three recent testimonials, must be addressed to me at the Municipal Buildings, Aldershot, not later than the 14th day of February, 1917, endorsed "Surveyor's Assistant."

(Signed) D. LLEWELLYN GRIFFITHS,
Clerk to the Council. (3,281)

SHERBORNE URBAN DISTRICT COUNCIL.
APPOINTMENT OF (TEMPORARY) SURVEYOR AND SANITARY INSPECTOR.

The above Council invite applications for the appointment of Surveyor and Sanitary Inspector, subject to one month's notice on either side. Applicants must be ineligible for military service, and be good Draughtsmen and Surveyors, and have efficient knowledge of all departments of a Municipal Engineer's Office, including all Sanitary matters, Sewage Works, Waterworks, Maintenance of Roads, &c., and must hold the Certificate of the Royal Sanitary Institute, and be fully competent to carry out the duties appertaining to the respective offices.

He will be required to commence duties at the end of April next.

Applications, endorsed "Surveyor," stating age, experience, qualifications, and salary required, accompanied by copies of three recent testimonials, to be sent to the undersigned, from whom further particulars may be obtained, on or before Monday, February 12th next.

H. J. SEYMOUR,
Clerk to the Council.
Sherborne, Dorset. (3,282)

TEMPORARY Qualified Assistant required at once for period of War. Applicants must be ineligible for Army. Municipal experience essential. Applications, giving all particulars, and salary required, to F. Wilkinson, ASSOC.M.INST.C.E., Borough Engineer, Town Hall, New Cross-road, S.E., to be received not later than Friday, 9th February. (3,279)

MISCELLANEOUS.

FOR SALE. Volumes of SURVEYOR, bound in publishers' covers, also loose numbers to date, also Vols. XXV. to XXXII. of "Proceedings" of Institution of Municipal and County Engineers, publishers' covers and loose numbers with binding covers to date, all in perfect condition.—Samuel Turner, Surveyor, Ashby-de-la-Zouch. (3,278)

TENDERS WANTED.

COUNTY BOROUGH OF STOKE-ON-TRENT.

The Council invite Tenders for the Supply of Materials and Goods for the year ending 31st March, 1918, as under:

1. Portland Cement.
2. Blue Paving Bricks and Common Bricks.
3. Sanitary Pipes and Gullies.
4. Kerbs and Setts.
5. Macadam and Chippings.
6. Pitch and Creosote Oil.
7. Cast-iron Work.
8. Picks, Shovels, and General Ironware.
9. Paints and Oils.
10. Soap, Soda, &c.
11. Brooms and Brushes.
12. Bath Towels, Dusters, &c.
13. Ironmongery and General Stores.
14. Disinfectants.

Specifications, Conditions, and Forms of Tender may be obtained on application to the Borough Surveyor, Town Hall, Stoke-on-Trent, and Tenders, sealed and endorsed, must be delivered to him on or before the 17th February, 1917.

E. B. SHARPLEY,
Town Clerk.

Town Hall,
Stoke-on-Trent.
February, 1917. (3,280)

CORPORATION OF RAWTENSTALL.
TENDERS FOR MATERIALS, LABOUR, COAL, AND COKE.

The Corporation of Rawtenstall invite Tenders for the Supply of the following:—

Road Metal, Earthenware Pipes, Gullies, Timber, Pitch, Creosote Oil, Disinfectants, Portland Cement (British), Iron Castings, Local Stone (Flags, Setts, &c.), Workmen's Tools, Scavenging Brushes, Horse-shoeing, Coal and Coke for Depots and Schools; also for the Carting of Road Metal from the railway stations, and for Team Labour.

Forms of Tender can be obtained on application to the Borough Surveyor, Town Hall, Rawtenstall. Sealed Tenders, endorsed with the names of the Articles tendered for, must reach the Town Clerk's Office, Rawtenstall, not later than Thursday, the 15th instant. The Corporation do not bind themselves to accept the lowest or any Tender.

N.B.—Tender Forms will not be issued unless applied for, and no Tender will be considered that is not delivered within the prescribed time.

(By order)
JAMES WHALLEY,
Town Clerk.

Town Hall, Rawtenstall.
February 2, 1917. (3,276)

CITY OF BIRMINGHAM.

The Public Works Committee are prepared to receive Tenders for the Supply of Materials for one year, ending March 31, 1918—viz.: Granite Kerbs, Setts, Crossing Stones, Chippings, Flags, Paving Bricks, Wood-paving Blocks, Ragstone, Limestone, Tarred Limestone, Tarred Roadstone, Gravel, Sand, Slag, Lias Lime, Portland Cement, and Stoneware Pipes.

Forms of Tender, Copies of Conditions, and Specifications may be obtained on and after the 1st inst., at the City Surveyor's Office, Council House, Birmingham, on payment of £1 for each copy, which will be returned on the receipt of a *bonâ-fide* Tender, for the whole or any portion of the Materials required. Samples of Materials tendered for must be sent, carriage paid, to the undersigned. Tenders must be made out on the Forms provided, and delivered at the undermentioned Offices on the 12th day of February, 1917, endorsed "Tender for Paving Materials, &c.," and addressed to the City Surveyor, Council House, Birmingham. The person whose Tender may be accepted will be required to conform with the provisions of the Trade Board's Act, 1909, and to provide approved sureties in sums of £300 each for the due performance of the Contract. The Committee do not pledge themselves to accept the lowest or any Tender, and reserve the right to accept portions only of a Tender.

HENRY E. STILGOE,
City Engineer and Surveyor.

The Council House,
Birmingham.
February 1, 1917 (3,277)

The Surveyor

And Municipal and County Engineer.

Vol. LI. FEBRUARY 9, 1917. No. 1,308.

Minutes of Proceedings.

Waterworks Design.

It is the duty of the modern water engineer to take into account the bearing which new discoveries and methods may have upon the design of new undertakings. The possibilities and advantages of electrical power produced at a central station and available at various points in a district are something which may well change the whole conception of a scheme under certain conditions. The power of purifying the most polluted water to a high standard is another all-important factor, while the freedom from incrustation of mains, rust, and clogging, which is to be obtained by water treatment, does away with a certain element of uncertainty which has given much trouble in the past. Again, a means of rapidly increasing the pressure in any main or section of mains, so as to provide an efficient fire service, is provided by the electrical pump, which may under certain conditions do away with a high service reservoir, together with pumps, mains, and plant constituting a very expensive item of first cost.

The waterworks at Aurora, Illinois, provide an example of the application of electrical energy to the problem of water supply which is well worthy of attention. A description of the works is given in New York *Engineering News*. The City of Aurora obtains its principal supply from a group of deep wells at the waterworks, but in order to increase this supply other wells have been sunk in different parts of the city, having their own electric pumping plants so as to form independent units. Auxiliary pumps provide for increasing the pressure in the mains in case of fire. A number of deep wells have been sunk in the city, generally near street intersections, so that the water which is pumped directly into the mains may travel in four directions and may have the shortest possible distance to flow before being consumed, thus reducing the friction loss in the mains to a minimum. One can see at once that we have a system in which the cost of pumping and water mains is very small. Against this saving in first cost one must not forget the cost of making the wells. However, the idea is fascinating, and there must be many cases in which the principle could be applied with great advantage, saving large and complicated distributing systems, and possibly making use of a supply of water which could not be tapped in sufficient volume at any one point, but which might, however, be tapped in ample quantity at many points considered collectively.

Twenty-five years ago many persons were of opinion that the proper source of supply for London was the water bearing chalk, which extends everywhere below the area to be supplied. Although the idea was ultimately considered impracticable, it is yet a fact that this underground reservoir is sufficiently useful, and forms an important auxiliary supply. But each well has its own separate engine and pump and a system of mains, tanks, and so forth. In the London area there are several hundred wells, from which private supplies are procured in the middle of the district of the Metropolitan Water Board. If the expense of first cost, pumping, and distribution were ascertained, it would probably be seen that this auxiliary supply is collectively a very extravagant matter, yet it exists even in a district possessing a very perfect system of distributing mains with an ample quantity for supply where it ought to be unnecessary. If this is the case, even in London, it is evident that in the design of new systems such auxiliary sources of supply may be very important, and that the adaptation of electrical pumping may make them possible and lead to a great saving of money.

Local Authorities and the War Loan.

So much depends upon the success of the huge War Loan now being raised that we have no hesitation in referring to the matter in these columns. Our immediate purpose is not to appeal to our readers personally to do their utmost to help the loan—we are confident that any such appeal would be quite superfluous—but to point out the various ways, both direct and indirect, in which local authorities can render valuable help. These are well summarised in a circular which has just been issued by the Local Government Board. In the first place, it is pointed out that in the case of such funds as sinking and redemption funds for the repayment of loans, superannuation funds, reserve and depreciation funds, and other moneys which local authorities are required or authorised to invest, the new War Loan is an authorised and desirable security for the investment. Where the direction or approval of the board is required before the investment can be made, the department are quite ready to give it, and it is indicated that a local authority may make arrangements with their bankers to enable them to invest in the loan, in advance, moneys which they will in the ordinary course have avail

able for investment within a reasonable period. The question of the investment of revenue balances is perhaps a little more controversial, and that part of the circular which deals with this subject is very properly couched in guarded language. The department consider that local authorities may invest in the loan such part of their revenue balances as is not likely to be required in the near future for meeting their expenditure. Many local authorities have at present large balances due to normal times, in consequence of their diminished expenditure resulting from the postponement of works of maintenance and repair, and the department think such balances may be invested in the loan instead of being applied to the reduction of the next rate. Although any balance of rate moneys, whether invested or uninvested, must be taken into account in framing the rate estimates, a local authority are not bound by law to reduce the forthcoming rate in respect of the amount invested if there is a possibility that the full amount may, under altered circumstances, be required to defray expenditure for the period to be covered by the rate. Finally, the circular casts a new, though optional, duty on local authorities, as it authorises an arrangement with bankers by which they could purchase a certain amount of War Loan Stock and institute a scheme for enabling persons of small means in their district to purchase such stock by instalment payments spread over a period longer than that for the payment of instalments under the loan prospectus. It is stipulated, however, that no charge on the rates shall be involved. We feel sure that local authorities throughout the country will heartily co-operate with the Government in this important matter.

* * *

Glasgow Corporation and Cottage Homes.

When the Glasgow Corporation discussed recently the proposed scheme to erect from twenty to thirty tenements after the war, an amendment was proposed that instead of tenements 300 cottage homes should be built on sites to be determined upon afterwards. The argument of the proposer, Mr. Charlton, was that, it being agreed that an improvement should be made in the class of house to be provided, this could be best attained by the erection of cottages. At the same time he contended that the corporation should set the standard now, which in time would be universal, and not "perpetuate the horrible tenement system." The question of sites for the cottages appeared to be quite a stagger to Treasurer McMillan that it quite upset his mental balance, his view being that to carry out the proposal to extensively would require all Lanarkshire, Renfrewshire, Dumbartonshire, and Stirlingshire. Parenthetically it may be stated that sites of the extensive area here mentioned have been defined, and there is not therefore any assurance that they will be secured without the difficulties which ordinarily confront corporate bodies when they go land-buying. Bailie Stewart was able to see no way out of the dilemma but the hypothetical erection of tenements when he stated that if they were to extend the city by 12 miles in the circumference they would have the whole of the population of the country there. There was, of course, little hope for the amendment to erect cottages, which was eventually defeated by seventy-seven votes to fourteen, but it was certainly significant that Mr. Charlton, chairman of the Special Committee who reported on the question, had nothing to say in opposition to cottages. His excuse for opposing the amendment was based upon the financial aspect, by doing away with the tenements. This was a mere excuse, and must remain so unless and until it is conclusively proved that a scheme for the provision of cottages could not be completed within a reasonable time limit. But Mr. Morton gave his case away when he proceeded to eulogise the class of cottages which the Government are erecting at Tollcross, which, he declared, are a splendid example of what can be done in cottage building, and which the Government are proposing the Glasgow Corporation should take over after the war. It is possible, and indeed quite probable, that the experience of these cottages may help to overcome the prejudice which so many members of the corporation entertain against this particular class of dwelling.

* * *

Urban Land Cultivation.

In December last we drew attention to the then recent Order of the Board of Agriculture and Fisheries, by which powers were conferred on certain local authorities with regard to the cultivation of land in urban areas for the purpose of increasing the home-grown food supply. The matter has been taken up with vigour in many districts, and with a view to guiding into proper channels the efforts that are being made, an important circular letter has just been issued jointly by Lord Rhondda and Mr. Prothero. This circular is directed in the first place to securing effective local organisations for the purposes of the scheme. It is pointed out that full effect cannot be given to the Order unless there is a real driving power in each district. As a rule, this driving power must come from the local authority, and it is therefore desirable that, where satisfactory measures have not been adopted by voluntary organisations, the local authority should immediately take all necessary steps to secure a full cultivation of available land within their district. For this purpose it is suggested that it may be well to appoint a working committee which will inspire general confidence to carry the scheme into full execution. Another innovation indicated in the circular is the direct cultivation of vacant lands by local authorities themselves. Thus, although the primary aim of the scheme is to promote and encourage the voluntary efforts of inhabitants to cultivate available lands in their spare time, objection will not be taken to direct cultivation by a local authority who, having possession of a suitable piece of land, find that they cannot dispose of it to cultivators, and that the only alternative to direct cultivation would be to leave the land idle. The adoption of this course, however, would only be justified if it would enable advantage to be taken of spare labour which would not in any case be employed on food cultivation. Other points with which the circular deals are the necessity for securing the active co-operation of women, the partial repayment in certain circumstances of expenditure in excess of the grant of £2 per acre already announced, and the release of lands cultivated under the Order from liability for the repayment of rates.

* * *

Public Conveniences and Nuisances.

The selection of suitable sites for the placing of public urinals is a duty in the discharge of which local authorities must inevitably run the risk of offending individuals, and cases arise from time to time in which injunctions are sought to restrain them from placing these ameliorations in necessary structures in some particular spot. An example occurred recently in the Penge Urban District, the council of which erected a public urinal adjoining some dwelling houses, under their power derived from the Public Health Act, 1875, to "provide and maintain urinals in proper and convenient situations."

Thereupon the owner and occupiers brought an action against the council, alleging that the structure was a nuisance by reason of its position, construction, and user, and in the course of the hearing the whole question of the extent of the powers of local authorities in regard to this matter was discussed. To begin with, it appears from the judgment of Mr. Justice Astbury to be quite clear that a local authority has no right to erect a convenience which in fact is, or which constitutes, a nuisance to adjoining houses. In the next place it was definitely held that the mere placing of a public convenience near to or adjoining a dwelling-house is not sufficient in itself, and apart from other circumstances, to constitute a nuisance. On the contrary, a plaintiff, in order to succeed, must show that the structure as used, and having regard to its situation and the requirements of the neighbourhood, has caused a legal nuisance to him. On the facts of the particular case, the learned judge found that the council had exercised their powers in good faith, and that the mere presence of the convenience in the situation in which it had been placed did not constitute a nuisance to the plaintiffs, but, inasmuch as there was a chance of a nuisance by reason of the open roof and certain openings at the back of the urinal, he made an Order restraining its use until these defects were remedied.

* * *

Building By-laws.

In letters to the *Times* and other newspapers, Mr. Gordon Allen, F.R.I.B.A., has once again raised the question of the need for revision of existing building by-laws. In doing so, however, we venture to think that he puts his case too high when he says that "all building by-laws have long become obsolete." It is, of course, beyond argument that building in many individual districts is subject to codes of by-laws which were made in the early days of the by-law era, and we have never ceased to urge that in these cases the by-laws should be revised and brought up to date without delay. Those who make light-hearted attacks on by-laws as such are apt to forget, or grossly to under-estimate, the very useful functions that they have performed and continue to perform in the regulation in the interests of the working population of the gentle art of the jerry-builder. Mr. Allen's precise proposal is not quite clear, for while in one letter he says that "the *abolition* of many of these obsolete and inconsistent enactments is now a matter of national importance," he admits in another place that it is essential "to keep up a high sanitary standard and to prevent flimsy construction." Again, while complaining of the inconsistencies which undoubtedly exist between the codes of by-laws in operation in different districts, he asks at the same time for differentiation according to the character of localities. On this part of his case, too, his major premiss is grossly exaggerated when he alleges that "no two local authorities have similar by-laws." We fully admit that the present system is not without serious defects, but it will certainly need more careful criticism than that of Mr. Allen if the model code, capable of variation to suit the needs of particular areas, is to be superseded by some more efficient plan.

Road Services in France: A Complaint.

The appeal that was made some time ago to highway engineers to volunteer for service in connection with roads in France received a very wide response, and many municipal engineers have, to our knowledge, found in this work the opportunity which they had been seeking of applying their professional skill directly to the winning of the war. On the other hand, many surveyors above military age offered their services, and, to judge from letters which reach us, have not even been favoured with an acknowledgment. This certainly points to some defect in organisation, and although in the present pressure perfection in arrangement cannot always be expected, it is only by calling public attention to defects that they are likely to be remedied. While speaking on this subject, we may perhaps refer to another complaint made in the columns of the *Newcastle Daily Journal* under the heading "Official Muddling." Speaking of the Roads Corps, our contemporary says that "all went well so long as the experts were left alone, which was not for very long. Considerable dissatisfaction now exists at the action of certain officials of the War Office in superseding acknowledged professional authorities by jockeying into superior positions War Office soldier nominees. These officers are doubtless excellent military men, but they know nothing about roadmaking, and already the result of this jealous interference, and the placing of amateurs over experts, is said to be seriously retarding the enthusiasm of the local experts in securing the necessary recruits." This is certainly very disquieting, and it is to be hoped that some official statement, either by way of denial or explanation, may be vouchsafed.

* * *

A Building Contract Case.

A question of great interest concerning the construction of building contracts was raised in the case of *Hampton* v. *Glamorgan County Council*, which has now been finally decided by the House of Lords. The county council entered into a contract with a builder for the erection of some school buildings, and included in the contract were a number of provisional items. Among other matters, it was definitely contemplated that a low-pressure heating apparatus should be provided by a sub-contractor, and for this the sum of £450 was set aside. The builder, however, failed to pay the sub-contractor part of this sum, and the latter thereupon brought an action against the county council, claiming from them the balance due. In these circumstances the House of Lords held that upon the construction of the building contract the builder in employing a sub-contractor, or specialist, for the installation of the heating apparatus, up to a cost of £450, was acting as principal and not as agent of the building owners, and as no privity existed between the plaintiff and the defendants, the action had rightly been dismissed. It was also held by Lord Shaw of Dunfermline: There is no presumption under the law of contract that the effect of a clause containing provisional items is generally to make the building owner a real principal upon the contract under which such items are supplied. It is a question to be decided in every case by the language of the specific contract.

"London as it Ought to be."—With the Mayor of Stepney (Alderman H. T. A. Chidgey) in the chair, Mr. Davidge and Mr. Arthur Crow, of the London Society, on a recent evening at Toynbee Hall addressed the members of the Stepney Council on Public Welfare on the subject of "London as it Ought to be." Mr. Davidge (the *Morning Post* reports) urged the necessity of providing easier exits from London. Mr. Crow dealt largely with the question of arterial roads and their relation to slum dwellings. Unless, he said a properly ordered scheme of development, with adequate means of transport, were arranged the congestion in the East-end and in London over the Border would be intensified beyond conception. It was not intended that the whole of the suggestions of the London Society should be undertaken at once, but that the roads most urgently needed should be proceeded with. The Barking By-pass, approved by the authorities, should be carried out at the earliest possible moment, and the speaker suggested that this work might be undertaken by the Royal Engineers on the declaration of peace and before demobilisation.

The Main Drainage System of London.*

By GEORGE WILLIAM HUMPHREYS, M.Inst.C.E., Chief Engineer to the London County Council.

Two papers dealing with the main drainage system of London are to be found in the "Proceedings" of the Institution of Civil Engineers. Sir Joseph Bazalgette, in 1865, described the creation of intercepting sewers which had been constructed shortly before that date, and Messrs. Wouth & Crimp brought the subject up to date in 1897. The present position of the undertaking, at the end of 1916, is described in this communication.

London was originally drained by means of the old open tributaries of the Thames, examples of which are the Counters Creek, the Westbourne, the Kilbourne, the Fleet, the Walbrook, &c., and these tributaries, although covered in, perform the same function to-day. At a later stage cesspools were introduced. Following upon the introduction of the water-closet in 1810, the overflow from the cesspools into the sewers, at first prohibited, became permissive, and in 1847 became compulsory. Cesspools were then abolished, and the state of the Thames became offensive by reason of these streams discharging within the boundaries of the Metropolis. In 1855 and 1858 the Metropolis Management Acts were passed, whereby the Metropolitan Board of Works was constituted, and *inter alia* was charged with the duty of providing and controlling a set of main or arterial sewers to drain the Metropolis, a similar duty as regards local sewers being entrusted to local parishes or vestries. A system of large intercepting sewers, which ran from the West of London, was decided upon and constructed. They discharged into the Thames at points below the Metropolis, the outlet for the northern side of the Thames being placed at Barking, and that for the southern side at Crossness. The discharge was effected on an ebbing tide, the sewage in the tidal intervals over the period of high water being stored in reservoirs at the outfalls.

In 1884 a Royal Commission reported as to the state of affairs then existing, the discharge of crude sewage into the river at the new outfalls having been found to produce disagreeable effects, owing to the time taken for the discharge to reach open water, due to the daily tidal oscillations. In consequence of this report, works were undertaken to obtain precipitation of the sewage at the outfalls, the resulting sludge being taken out to sea and discharged in the vicinity of the Maplin Sands by means of specially-constructed vessels.

Since 1897, the date of the last communication to the institution, the London County Council, constituted in 1889, has carried out many

large and important works

for the improvement of the system and the amelioration of the drainage conditions over the large and populous areas now drained. During the first ten years of that body's existence many important works were undertaken, but in 1899 it adopted a scheme, based upon recommendations put forward by Sir Benjamin Baker and Sir Alexander Binnie, to enlarge the arterial system at an estimated expenditure of £2,750,000, and in 1903 it decided to expend, as a commencement to those works, another £751,000, on a scheme prepared by Sir Maurice Fitzmaurice for storm-water features, sewers and works. Upwards of £4,000,000 has been expended on this scheme up to date, the advent of the war having delayed completion of certain works. The old intercepting and outfall sewers, both on the north and on the south side of the river, have been practically duplicated and large provision has been made for the dealing with heavy rainfalls by the provision of storm-water sewers and pumping stations. Altogether about 87 miles of sewers, the greater length of which consists of large main lines, have been constructed by the London County Council.

Dependent as London is upon the tidal level in the Thames for its drainage discharge, the existence of a large area of 21 square miles in the heart of the Metropolis, the level of which is below very high water, and 19 square miles of which is below the level of an average high water, makes the storm-water drainage problem a difficult one to deal with completely. The authorities have recognised this by imposing restrictions on the erection of dwelling-houses on the low-lying area when certain conditions prevail. The author is of opinion that there is need for further legislation in order that the problem may be satisfactorily dealt with in the future, and that further provision will have to be made in the direction of providing additional storm-water outlets to the Thames, the provision made as regards intercepting sewers probably being sufficient for many years to come.

Several features of great interest presented themselves during the construction of the

new intercepting sewers.

The most marked was the comparatively small disturbance caused to the general community during the progress of the works, carried out as they were through the most populous parts of the Metropolis. A system of tunnelling was adopted wherever possible, and very long drives were made, reaching in one case up to 6,129 ft. Wherever sewers passed near to valuable properties, the tunnel was driven with a shield and cast-iron segments were inserted, lined on the inside with concrete and brickwork. This method of construction proved also very valuable where bad ground was encountered, the Thanet sands heavily charged with water being satisfactorily dealt with by these means. The highest class of workmanship has been insisted upon even in small details. Where, owing to the lapse of time, defects have developed in the old works, improvements have been effected, but the main features of the scheme laid down and initiated fifty years ago remain to-day in their original form, and have an equally long prospect of utility before them.

The population of the Administrative County of London at the last Census (1911) amounted to 4,500,000, in round figures. The London County Council has admitted to its drainage system the sewage from certain outlying areas, as, in fixing the county boundaries, considerations of watershed areas were not adhered to. In agreeing to drain these outside areas, the proviso has generally been made that only sewage to the extent of about 50 gallons per day per head of population on the area served is to be delivered and dealt with. Storm-water flow is therefore excluded. The system therefore dealt with an estimated population of 5,334,731 in 1911, and the indication given of change in these figures to the present date (1916) is that, as regards the county area, there is a slight diminution, while there is an increase in the out-county areas.

The total quantity of sewage computed to have reached the outfalls was about 200,000,000 gallons a day in 1894-95, and 280,000,000 gallons a day in 1914-15, an increase of 80,000,000 gallons per day over the discharge of twenty years ago. Compared with the past this is composed in part of rainfall that formerly was discharged by means of the old river-valley sewers and was not intercepted.

The effect of the elimination of the greater part of the suspended solids at the outfalls, and their conveyance to sea as sludge, when this operation was in working order in or about the year 1893, was immediate. The change in the condition of the foreshores and the river bed has been remarkable. The cost of

removal of the sludge to sea

during the past ten years was on the average, for working alone, 3·8d., or, including capital charges, 4·4d. per ton of sludge dealt with. The cost of precipitation over the same period has amounted, on an average, to £1 3s. 4d. per 1,000,000 gallons dealt with, including capital charges. The discharge of the sludge in the outer estuary of the Thames has been accomplished without any prejudicial results, and certainly by no other method could a like result, as regards low cost and immunity from nuisance or harm, have been attained. The London County Council has purchased about 750 acres of land in the neighbourhood of and surrounding its outfalls. This has the effect of isolating the outfall works, and at the same time the land would be available if later on future developments should demand the treatment by tried bacterial or other processes of either some portion of the effluent or the sludge.

The capital outlay on the system over the period

* Abstract of paper read before the Institution of Civil Engineers on Tuesday last.

1856 to March 31, 1914, amounted to about £12,500,000, of which approximately one-half has been repaid. The nett expenditure for maintenance for the year 1913-14 was £303,402, towards which out-county areas contributed £28,467. The rate charges for main drainage services (capital and maintenance charges) in the county area amounted to 3·355d. In addition to this, Londoners pay the local drainage rate, which, roughly speaking, is 1d. in the £ averaged over all the borough council areas.

HOUSING OF MUNITION WORKERS.

A COVENTRY SCHEME.

All (nearly 600) houses which were erected last year at Stoke Heath, Coventry, for munition workers are occupied, and the Ministry of Munitions has placed before the city council a scheme for building 200 dwellings on the south-east side of the city, off Park Side. The Minister is prepared to bear the cost, with the suggestion that the corporation should be willing to take over the properties after the war. The council (says the *Birmingham Post*) is recommended to accept the proposal, subject to their having the benefit of State aid as favourable as that which may be given to other schemes. In the Stoke Heath building the Ministry paid the difference between pre-war prices and those then existing.

Coast Sand Dunes (By Gerald O. Case, St. Bride's Press, Limited, 24 Bride-lane, E.C., price 5s.).—Mr. Case has done a valuable work in the writing of this book.—*Southport Guardian.*

TRAMWAY CARS IN STREET CLEANSING WORK.

AN AMERICAN TOWN'S EXPERIMENT.

Tramway car street flushers have been in use in the cities of Worcester and Springfield, Mass., for over a year. Worcester was the first city in the United States to introduce street-car sprinklers, and in 1915 it was the first to introduce the new street-car flushers. Mr. A. T. Rhodes, Street Commissioner of Worcester, from whom the following data were obtained by *Engineering News*, states that these machines are operated throughout the entire season with great satisfaction—so much so that during last year the older methods of street cleaning were abandoned on all paved streets where there are electric tramway tracks.

The cars employed in the work contain a tank with a capacity of 2,900 gallons. The tanks are filled from subsurface hydrants placed between the tracks of the tramway system, and accessible by removing ordinary sewer manhole covers. The temporary connection is made by flexible leather pipes.

Street-flushing Tramway Car at Work.

The pressure for flushing is obtained by a centrifugal pump having a maximum capacity of from 500 to 600 gallons per minute, a speed of 2,600 revolutions per minute, giving a normal working pressure of 80 lb. per square inch. The pump is driven by a 45-h.p. electric motor. The pump discharge is equipped with a by-pass, enabling the operator to cut down the nozzle pressure to as low as 30 lb. per square inch. The operation of the car and flushing apparatus requires the services of three men.

On the wide streets there are five nozzles pointing in the direction the car is going, three on the car and two on the swinging arms. One of the three nozzles on the car, on a double-track street, catches the refuse lying on the paving between the two tracks, and throws it to the opposite track, then the return trip in the opposite direction catches the material and flushes it to the gutter.

Flushing Car using Sprinkling Apparatus.

Sprinkling within an hour ahead of the flushing has been found to be essential for the best results. For this purpose the older sprinkler type cars are economically used. The sprinkling softens up any deposits which are stuck down on the pavement, and makes it easy to remove them with the flusher. The new flusher cars have the original sprinkling attachments, both on the car and on the swinging arm, so that the same car can be used for both sprinkling and completing the work with the flushing nozzles, if so desired. With preliminary sprinkling

a car flusher will cover about 10½ miles of street per night. The average eight hours' work for a car doing both sprinkling and flushing is about 9 miles of street, varying from 25 ft. to 75 ft. between kerbs. During eight hours' use the car flusher distributes approximately 95,700 gallons of water. One tank of water is sufficient to sprinkle a street 38 ft. to 45 ft. wide between kerbs a distance of about 1 mile. The same tank of water will properly flush between one-quarter and one-third of a mile.

Previous to the adoption by the city of the method of flushing at night, the streets were sprinkled by trolley cars during the day. Under the day sprinkling system the water simply laid the dust, and the other refuse which had accumulated upon the street surface remained, forming a greasy, slippery scum, extremely dangerous to vehicular traffic. Night flushing has made it possible to discontinue sprinkling during the day.

When the day sprinkling was in operation three car sprinklers, making several journeys over each street every day, covered the same area now covered by two flushers, making one round trip nightly, for sprinkling and flushing combined. The flushers work eight hours, and the sprinklers under the old method worked 14 hours per day. The amount of water used under the flushing system is about 60 per cent of that used under the old style sprinkling, while the present combined sprinkling and flushing requires about 85 per cent of the former amount.

Previous to the installation of this system two machine broom gangs were worked at night, covering these paved streets from two to three times per week. This work cost £2,800 yearly, and was not very satisfactory. Moreover, it was difficult to keep track of the labour during the night hours. This has been discontinued entirely; the only cleaning necessary is done by pushcart men, the first thing in the morning. They clean up the gutters, and owing to the fact that the streets are absolutely clean when they reach them, their labours have not been increased, nor is there any additional expense incurred.

THE CULTIVATION OF ROADSIDE WASTES.

LANCHESTER COUNCIL "WINKS AT" THE PROPOSAL.

At a meeting recently of the Lanchester Rural District Council, Councillor Lubbock introduced the question of the cultivation of land by the roadside. He did not know, he said, whether permission for this could be given by the council. If so, he suggested that applicants should give their names to the surveyor under whose control the necessary arrangements could be made. He thought it must be recognised that they could not all keep pigs, but everybody could do something to utilise spare ground and help to produce food. From his knowledge of Lanchester there would be a lot of applications. There were twenty-three from the bottom part of Lanchester who applied, but they could not be accommodated by the council, owing to the enormous price asked for land.

Councillor Lowdon: Is this not a question for the parish council?

Councillor Davis: Not the roadsides. If Mr. Lubbock puts his suggestion as a motion I will second it.

The chairman (Councillor W. Robinson) said he had received applications from No. 1 for permission to cultivate the waste ground by the roadside opposite the Rectory there. He told them they would have to apply there names to the surveyor.

Councillor Lubbock said he knew some gentlemen in Lanchester who were anxious to get land within reasonable distance of their houses. The surveyor might then consult and report. He moved his resolution.

Councillor R. Davis seconded.

Councillor Ripley inquired if the council would protect the parties who cultivated the land by the roadside or have any responsibility in the matter?

The chairman: No responsibility whatever.

The clerk: The council cannot give permission but you might wink at it. Still, it does not give the cultivators who occupy that whatever fences they put up, the Dog, Dick or Harry may knock them down. Roadsides are public and must remain public.

Councillor Lubbock: Our surveyor could make that known when applications are received and tell them they take the whole responsibility. Most of the allotments know it already.

After further discussion the motion was agreed to.

ELECTRIC VEHICLES FOR BRIGHTON MUNICIPAL WORK.

The Works Committee of the Brighton Corporation reported recently that they have had under observation the progress which is being made in various towns in the substitution of motor traction for horse traction for street watering, scavenging, and house refuse removal. In June, 1915, they had on loan for a week from the manufacturers a motor dust van, which was operated with successful results; but the adoption of motor traction for house refuse removal purposes is not at present recommended.

The existing horse hire contract expires in June, 1917, and it is not expected that a further contract can be entered into in the same quarter.

As the result of their visit to various towns, the chairman of the committee (Alderman Pankhurst) and the borough surveyor (Mr. H. Tillstone) recommended that a 3½-ton electric motor vehicle and a 5-ton steam vehicle be purchased, each vehicle to have interchangeable bodies and to be used for watering and general haulage; they could also be used for ash collecting in certain places where arrangements would be made for quick loading.

The estimated cost of the two vehicles per annum is as follows:—

Five-ton Steam Vehicle.—Cost of purchase, £830; interest, depreciation, maintenance, wages, &c., £362 17s. 6d.; cost per day, £1 3s. 8d. 3½-ton Electric Vehicle.—Cost of purchase, £995; interest, depreciation, maintenance, electricity, wages, &c., £423 11s. 3d.; cost per day, £1 7s. 7d.

The present cost for horse and driver per day is 11s. 4½d. It is estimated that these two vehicles will do the work of six horse vehicles. The cost of the vehicles will be £2,050, including the watering tanks (£225), and as £400 has been received from the War Office for the steam roller taken over by the Road Board, the chairman and the borough surveyor recommended that this amount be used for this purpose, and that the balance be provided out of the amount estimated to be unspent (about £3,000) in the estimate for 1916-17 for highways, scavenging, street watering, and ash collecting.

The committee recommended that these two vehicles be purchased, which the town council agreed to. It was stated that the committee looked forward ultimately to substituting motor vehicles for horse vehicles for all purposes except that of house refuse collection, for which, at present, horse vehicles are more economical.

ELECTING A BOROUGH SURVEYOR.

HOW IT IS DONE IN IRELAND.

There was an extraordinary scene at the election of a borough surveyor for Ennis at the meeting of the urban council there on the 1st inst. At the hour fixed for the meeting, the *Irish Times* reports, it was found that the town hall door had been locked, and members of the council outside demanded admittance. Meanwhile a big crowd and a band had collected outside. One of the two candidates for the vacant office was among those who were locked out. The police were summoned, and when a body of constables arrived they tried in vain to get the doors opened. The chairman endeavoured to have the members who were outside admitted, but failed, and there were scenes in the hall, where heated interchanges took place. Then the chairman left the chair, and declared the meeting adjourned. Another member was immediately moved to the chair, and Mr. F. Tierney was declared elected as borough surveyor. Afterwards one of the members of the council was badly assaulted on his way home.

Edinburgh Refuse Collection and National Service.—The Cleaning and Lighting Committee of Edinburgh Town Council recently considered the probable effect upon their staff of the new national service organisation. Already the staff has been considerably depleted, and it is anticipated that more women will have to be enrolled in the city's service, although most of the work suitable for women is already being done by them. The committee point out that the public might help by burning more of the rubbish and refuse than they do at present, with the twofold advantage of saving fuel and lightening the load of collection.

Principles Involved in Computing the Depreciation of Plant.*

By F. GILL and W. W. COOK, MM.I.E.E.

(Conclusion.)

The engineer controlling a system must be able not only to know the annual charges on each kind of plant, but also to estimate the value remaining in the plant at any time.

In considering extensions of plant, or the adoption of improved plant, it frequently happens that the question arises whether it is economical to take out certain plant still performing satisfactorily the service it is adapted to, and replace it by new plant of a more economical nature. If the existing plant is taken out there will be a wastage of its then value in place, plus the cost of taking it out and less the amount received for the recovered materials, the nett result of this being a present loss when the change is made.

Against this loss there is to be set any economy in annual charges that may be gained by the new plant during the period which would have remained of the displaced plant's life. Further, since the wastage must be incurred when the change is made, while the prospective savings are in the future, the two sums must be brought to a common time for comparison; in fact, the problem is to find out if it is worth while to incur a present loss to achieve a future gain.

Unless the new plant will thus pay for the wastage, or unless there are compelling reasons which require the change irrespective of economy, the change should not be made.

The solution largely depends upon what is the value of the plant in place, still performing its service satisfactorily and capable of continuing to do so for some time longer, and the engineer must be able to estimate this value by some logical process.

If the first cost and the annual charges have been rightly estimated, the diminution in value is the amount which should be in the renewals fund, for that was the very purpose of the fund—that is, the first cost less the amount which should be in the fund is the measure of the remaining value—or, it may be stated, that the remaining value in the plant, plus the amount which should be in the renewals fund, is always equal to the first cost.

One easy way to test the equity of the value in place produced by the alternative methods used in treating depreciation is to examine how each would result if an undertaking passed successively to several owners, on the basis of the remaining value being the first cost less the amount which should be in the renewals fund.

In this case, as already shown, the life concerned is not the economic life, but the physical life, so that in calculating the following tables we must take the physical life of twenty-five years and the residual value, at the end of life, of £2.

Assume an original owner whose conditions are set out in Table 2 (5 per cent sinking fund), to whom the user of the plant pays £7·05 per annum, sells at the end of the eighth year on the basis of this table. He will then sell for £100 less £19·61 (the amount in the fund) = £80·39.

This second owner's conditions will then be: Capital £80·39, remaining life 17 years, residual value £2, other conditions as before, and the table shows these figures for the next eight years.

If the second owner transfers to a third owner at the end of the sixteenth year, on the same basis, he will then sell for £80·39 less £28·97 = £51·42.

The third owner's conditions will then be: Capital £51·42, remaining life nine years, residual value £2, other conditions as before, and the financial result is shown in the table.

If the third owner transfers to a fourth at the end of the twenty-fourth year, on the same basis, he will sell for £51·42 less £42·8 = £8·62.

This last owner's conditions will then be: Capital £8·62, remaining life one year, residual value £2, other conditions as before, and the table shows his position.

This last owner finds £2 from sale of materials, and £6·62 from his renewals fund, and thus gets back the money he had invested.

It is true that the portion of the annual charge allocated in this example to renewals becomes larger each year, being for the case under consideration £2·05, £3·03, £4·48, and £6·62; but that is only one part of the transaction, and the increase is exactly counterbalanced by the reduction of the charge in respect of return on capital, in this case £5, £4·02, £2·57, and £0·43. It will be observed that each successive owner has taken over the plant at what it would have stood at had part of the capital been paid back each year on the annuity method.

Thus each successive owner has had the same plant, the same annual charge, and has got back all his capital at the end of his term.

Of course, if the renewals fund is not credited with the same rate of interest as the return on capital, the strict equality will not hold good; but the only reason for accepting a less rate than the plant earns is to obtain a greater security for the fund than for the main investment, and this course is based on prudence rather than on equity.

Now contrast what happens under the straight line law, the annual rental remaining constant at the amount fixed by the first year's annual charge. The figures used are shown in Table 3.

The first owner's conditions are: First cost £100, life

TABLE 2.—VALUE OF PLANT IN PLACE: SINKING FUND METHOD.
First Cost = £100. Residual Value = £2. Physical Life = 25 years.
Return on Capital 5 per cent per annum.

A		B	C	D	E	G	H	L
End of year.		Capital.	Return on capital 5 per cent per annum.	Renewals fund.	Total C + D	Total in renewals fund.	Value of plant in place, B − G	Per cent return on capital.
In different ownerships.	In plant's life.							
First owner		£	£	£	£	£	£	
1	1	100·00	5·00	2·05	7·05	2·05	97·95	5
8	8	100·00	5·00	2·05	7·05	19·61	80·39	5
Second owner								
1	9	80·39	4·02	3·03	7·05	3·03	77·36	5
8	16	80·39	4·02	3·03	7·05	28·97	51·42	5
Third owner								
1	17	51·42	2·57	4·48	7·05	4·48	46·94	5
8	24	51·42	2·57	4·48	7·05	12·80	8·62	5
Fourth owner								
1	25	8·62	0·43	6·62	7·05	6·62	2·00	5

* From a paper read at a meeting of the Institution of Electrical Engineers on January 11th.

twenty-five years, residual value £2. He charges the plant with £8·92 per annum, and has the plant for eight years. During that time the money he receives, together with the interest earned by the renewals fund, which is not credited to its source—*i.e.*, the plant account—is sufficient to enable him to pay a return on his capital increasing from 5 to 6·37 per cent.

He then sells on the basis of this table at £100, less £31·36 = £68·64 and this, with what is in his renewals fund, his capital is repaid.

The second owner's conditions are: First cost £68·64, residual value £2, remaining life seventeen years, and the table shows the figures for the next eight years.

Here it is seen that the annual charges for the second owner, consisting of the return, column C, plus the renewals column D, fall short of the total for the original owner by £1·57, and this is available with the interest earned by the fund to give a total return on the capital increasing from 7·28 per cent per annum in the ninth year to £9·28 per cent per annum in the sixteenth year.

If the second owner transfers to a third at the end of the sixteenth year, he will sell for £37·28 (£68·64 – £31·36), and the conditions for this owner will be: First cost £37·28, residual value £2, remaining life nine years, and the result is shown in the table.

The balance here, column E, is greater than before, and therefore the figures should be, if interest be not added to the fund—

	Amount. £	Life in years.	£ × years.
Class A	300	10	3,000
,, B	200	5	1,000
,, C	100	2	200
	600		4,200

$$\text{Total average life} = \frac{4{,}200}{600} = 7 \text{ years.}$$

But in this calculation, £300 for Class A, £200 for Class B, and £100 for Class C were employed, whereas in the complete cycle of ten years the money actually involved will be:—

	£	£
Class A, one renewal	= 300 × 1	= 300
,, B, two renewals	= 200 × 2	= 400
,, C, five renewals	= 100 × 5	= 500
		1,200

TABLE 3.—VALUE OF PLANT IN PLACE: STRAIGHT-LINE METHOD.
First Cost = £100. Residual Value = £2. Physical Life = 25 years.
Return on Capital 5 per cent per annum.

A		B	C	D	E	F	G	H	J	K	L	M
End of year.		Capital.	Return on capital 5 per cent per ann.	Renewals fund.	Total C + D	Balance to equalise first owner's annual charge of £8·92 per ann	Total in renewals fund.	Value of plant in place B – G	Interest on fund.	Total return C + F + J	Per cent return on capital.	Average per cent return on capital.
In different ownerships.	In plant's life.											
First owner		£	£	£	£	£	£	£	£	£		
1	1	100·00	5·00	3·92	8·92	—	3·92	96·08	—	5·00	5·00	
8	8	100·00	5·00	3·92	8·92	—	31·36	68·64	1·37	6·37	6·37	—
Second owner												
1	9	68·64	3·43	3·92	7·35	1·57	3·92	64·72	—	5·00	7·28	—
8	16	68·64	3·43	3·92	7·35	1·57	31·36	37·28	1·37	6·37	9·28	—
Third owner												
1	17	37·28	1·86	3·92	5·78	3·14	3·92	33·36	—	5·00	13·41	—
8	24	37·28	1·86	3·92	5·78	3·14	31·36	5·92	1·37	6·37	17·09	—
Fourth owner												
1	25	5·92	0·30	3·92	4·22	4·70	3·92	2·00	—	5·00	84·46	84·46

and the total return on the capital increases from 13·41 per cent to 17·09 per cent per annum.

If the third owner transfers to a fourth at the end of the twenty-fourth year, he will sell for £5·92 (= £37·28 – £31·36), and the last owner's conditions will be: First cost £5·92, residual value £2, remaining life one year, and his position is shown in the table.

The last owner gets £2 for the residual value, which with £3·92 in the renewals fund repays his capital, and the total return on his capital is 84·64 per cent per annum.

Thus each successive owner has had the same plant, and has got back all the capital invested, but each successive owner has received a higher percentage return on the capital invested than any of the previous owners.

It may be argued that the amount of profit an owner can make has nothing to do with the value of the plant, and this is true. In the above cases the relative profits under the same conditions have merely been used to test whether the price at which the plant is valued comes out right or not.

When one finds that, on one hand, when interest is brought into the transaction there is absolute equality as between various years or various owners, and on the other hand when interest is not brought in, the successive year or successive owner is always progressively favoured, one has good ground for the conclusion that all is not right with the method of valuation which includes interest on the renewals fund payments.

EQUATED LIVES FOR COMPLEX PLANT.

In treating a case in which there are various lives, it does not appear to be well known that the average life obtained is the usual manner of getting a weighted average is an erroneous figure to use in calculations for redemption of money.

If we take a plant consisting of three classes of articles, having different first costs and lives, as shown below, we find that the average life is seven years, obtained as follows:—

	Amount. £	Life in years.	£ × years.
Class A	300	10	3,000
,, B	400	5	2,000
,, C	500	2	1,000
	1,200		6,000

$$\text{Equated life} = \frac{6{,}000}{1{,}200} = 5 \text{ years.}$$

One usual way of calculating this equated life—*i.e.*, without interest, is to divide the first cost by the sum of the annual instalments. If, on the other hand, interest (say 5 per cent per annum) is added to the renewals fund, the calculation will be 4·95 years as the equated life. If an average life of seven years is taken for calculating the provision, the actual deficit will be £1,200 – £857 = £343 in the ten years.

It will be seen that there is a great danger if the difference between average and equated lives is not appreciated. For a complex plant, use of the average life will result in inadequate provision, because the equated life is always shorter than the average life. Provision for a complex plant can only be made either by providing separately for each part and summating the annual payments, or by using the correct equated life and treating the plant as a whole. When, however, a subdivision of plant having the same general characteristics is considered, the average lives or ages may safely be used.

WHERE LIFE IS LIMITED BY UNITS OF WORK PERFORMED RATHER THAN BY TIME.

In some cases the life of plant is limited by the units of work performed rather than by time. One

example of this is a tool such as a lathe or press; another is a locomotive. Such things do not wear out by the passage of time, but by the work which is done by them, and it would be wrong to estimate the life of such a thing merely in years irrespective of work.

The question arises how the proper charge per unit of work is to be arrived at, since in some cases there must be found the correct amount to be charged to each job for the use of a tool or machine.

In such a case time—*i.e.*, the physical and economic lives—must be brought into the calculation, and one is bound to estimate a period during which the units of work will be performed in order not to ignore the fact that the payment for depreciation is made in advance of the money being actually required, and therefore interest must accrue.

CONSTANT MAINTENANCE COST.

It has been assumed that the maintenance cost would be constant throughout the life of the plant, and it is necessary to return to this question.

The renewal of each part, as it is required in its turn, is provided for by the fund established on the basis of the equated physical life. An equated life arranged for all the plant provides money for the renewal of every part. The cost of maintenance is the cost of looking after the plant, keeping it in running order, repairs, keeping records and inspections, but not of making renewals. It seems clear from this reasoning that there is not much room for increasing maintenance cost.

Sometimes in practice it is found more convenient to charge small renewals to maintenance rather than to renewals account, but that convenience does not affect the question of fact.

We believe that constant maintenance cost, if full provision is made for renewals, is a tenable assumption.

Some advocates of the straight line method say that the interest on the depreciation fund is required to offset an alleged increasing charge. If there are cases of maintenance cost increasing with age, this increasing cost must, of course, be met, and any such cases will doubtless have well determined cost data, but the provision should be made directly and not indirectly. It would be curious indeed if on all classes of plant the increasing cost of maintenance were just the amount provided by interest at varying rates, compounded over various periods.

ASSESSMENT OF PROFITS.

The amount to be charged to depreciation, or as we prefer to put it, to renewals fund and to improvements fund, before assessing the profits of an undertaking, is the total amount indicated by the portion of the annual charges allotted to those costs. The correctness of the annual charges has already been discussed, and when these have been settled, then the charge against the year's income for renewals and improvements must follow in principle that settlement, subject to any alteration of fact which later knowledge may have brought to light. But this does not permit of any change in the method.

If the sinking fund method is correct for the annual charges, it must also be correct for the year's accounts; otherwise the annual charges are not true, and if they are not true, the primary object of ascertaining the annual charges—to select plant wisely—is vitiated.

The accountant cannot logically at this stage question the correctness of the charge; he may honour the bill or not, may put away more or less than the correct sum as given by the annual charges, but this sum remains the true measure of the year's debit against the undertaking.

The accountant has a duty laid upon him to insist on his share of the responsibility in providing for depreciation, but he must take up the question at the proper place—that is, in consideration of the depreciation component of the annual charges.

IF DEPRECIATION RESERVES ARE INVESTED IN THE BUSINESS.

Up to the present one assumption has been that the capital account was closed, and therefore the reserve funds could only be lent outside. But for many purposes it is more convenient to invest these reserves in the business itself rather than to lend them outside and raise fresh capital for the extension of the business. There is no difference in principle whether the reserve be lent outside or invested in the business; in either case the money must earn interest and the interest must be credited to its real source.

CONCLUSIONS.

There is only one common method for the financier, the accountant, and the engineer.

This common method is best studied in the annual charges for plant, determined in advance of construction.

To determine the amount in the annual charges for depreciation it is necessary to estimate the first cost, residual values, and the physical and economic lives of the various classes of plant.

It is also necessary to fix the treatment of the capital account and to estimate the charge for return on capital.

The interest to be earned by the reserve funds must be credited to its source.

The reserves are preferably handled by means of two funds, as follows:—

(*a*) A renewals fund for providing the necessary money at the end of the physical life—that is, the end of the period during which the plant will give its service satisfactorily under all conditions *outside* the owner's control.

(*b*) An improvements fund for providing sufficient additional money to enable the plant to be taken out of commission for reasons *within* the owner's control, and while it is still giving its service satisfactorily.

The calculation of the amounts to be contributed to these two funds must include the interest which should be earned by the money before it is required at the end of the life.

The amount, calculated as above, which should be in the renewals fund gives the correct diminution in value, when considering the value to the owner, of the plant in place and working, at any period in its history.

The amounts, calculated as above, which should annually be put to the two funds, renewals and improvements, determine the correct depreciation charge against the undertaking for the purpose of assessing profits, fixing rates, and, under certain conditions, assessing the value of an undertaking as a going concern.

The sinking fund method fulfils all the requirements.

The straight line method does not.

All estimates, such as first cost, physical and economic lives, and interest earned by funds, will require revision from time to time, either as a result of experience or of changes in conditions.

LOCAL AUTHORITIES AND FURNITURE STORAGE.

BIRMINGHAM COMMITTEE'S REPORT.

On the subject of the storage of the furniture of married Army recruits, the Estates Committee of the Birmingham Corporation report that they have considered the matter, and have also had the opportunity of inspecting two of the most recently-erected and up-to-date storage warehouses in the city. They state there can be no doubt that the business of storing furniture, entailing as it does vehicles and power for the removal from the house to the warehouse, with the packing and storage of such furniture in properly ventilated and heated store-rooms, requires a considerable capital and a staff trained and experienced in the work, which, if properly and systematically carried out, is of quite a complex nature. They have had an interview with representatives of the local Warehousemen and Furniture Removers' Association, who pointed out that only six removers and storers were carrying on business in Birmingham now owing to the poor financial return, and that there was still accommodation in suitable warehouses for about sixty van-loads of furniture. In the event of more accommodation being necessary the association pledged themselves to provide it in suitable buildings. The association were prepared to give an undertaking privately to the committee that storage accommodation would be provided at a rate which was agreed, and of course in addition to this there would be the usual charge for removal and the rate would not cover insurance.

The committee are of opinion there is or will be provided ample accommodation for the storage of furniture, that the charge proposed is reasonable, and that it would be unwise for the council to undertake the work.

Trade Wastes.—"Some Improvements in Dealing with Trade Wastes" is the title of a paper which Mr. R. D. West will read at a meeting of the Junior Institution of Engineers to be held on Monday, the 19th inst., at 7.30 p.m.

SEWAGE PUMPING: CENTRIFUGAL PUMPS v. PNEUMATIC EJECTORS.

To the Editor of The Surveyor.

Sir,—Messrs. Daniel Adamson's letter in your issue of February 2nd, under above heading, is interesting. As makers of the "Ratean" centrifugal pump their remarks must carry considerable weight.

There is a certain amount of irony in their use of these arguments, which first appeared in an article written by Mr. H. C. H. Shenton some ten years ago.

(1) One of the objections to pneumatic ejectors was leakage in air mains, but with Messrs. Stewart's and Lloyd's lap-welded steel protected pipes with electrically welded joints bottle-tight air mains can be obtained. Then as Professor Unwin has shown that thermal loss is given back in increased volume due to rise in temperature, pneumatic transmission is more economical than electrical.

(2) Another source of loss is leakage of air past delivery valve, but though this is a mechanical loss it is a sanitary gain, as it stops septic action in the sewage, and with latest developments in intensified aëration it means an eventual gain in treatment.

(3) Ejector chambers can be made more cheaply than subterranean chambers for electrically-driven pumps, and an ejector is less costly than a centrifugal plus motor, plus the costly electrical switch necessary. Thus, if power has to be put down, a pneumatic installation is cheaper than an electrical one.

(4) I have in several instances put forward ejector schemes in competition with electrically-driven centrifugal schemes, and in each instance the central pneumatic power plant has been of less horse-power than the aggregate power of the electric motors for driving the centrifugal pumps.

(5) My firm have lately taken out some electrically-driven centrifugal pumps and replaced them with pneumatic ejectors, using the existing motors to drive compressors for operating the ejectors, and the result is an actual saving in electrical units per week.

Yours, &c.,

J. H. Coombs.
of Messrs. Jones and Attwood, Stourbridge.
Makers of the "JandA" Ejectors.

THE CIVIC SURVEY OF SOUTH-EAST LANCASHIRE.

To the Editor of The Surveyor.

Sir,—May I trespass on your space to venture to suggest that you have been guilty of a slight injustice in your otherwise valuable summary of town planning contained in the issue for January 26th? Your paper is so remarkable for a sane and judicious outlook that I am sure you will forgive me pointing out a lapse from this attitude.

In your description of the work of the civic survey of Manchester you dismiss it in half a sentence by remarking that the plans "unfortunately showed the lack of practical experience which is so often associated with fine artistic qualities." I think that a little closer study of the work would correct this view.

At the meeting of the North-Western District of the Institution of Municipal and County Engineers which you refer to in your article it is true that as might have been expected there was a good deal of criticism on the methods, but I think I may say that this criticism was practically met. The principal exhibit, it will be remembered, was the road traffic plan, and the chief criticism levelled against it was that the traffic counts were taken per one hour, instead of for twenty-four hours. Of course the obvious reply to this would be that attempts to take one year of the work of the staff to obtain the traffic count of one hour each day would take that year on the basis of twelve hours. But a more crushing reply than this rough-and-ready one was made when it was pointed out that the object of the plan was to obtain a *record bird's-eye view* of the traffic conditions in the whole of this south-eastern area of Lancashire. The comparisons made by individual engineers invariably referred to counts in their own districts, which they were concerned with in particular roads or groups of roads, and where they wanted most exact knowledge concerning the variation of the seasons, different days in the week, and different hours in the day. For a general small-scale plan, however, one which corresponds to the eighth-scale drawings of a building, a one-hour's count was just as good as twelve. It was the comparative volume that was required. It was also stated that, to save investigation time on the part of the workers on the civic survey, the help and co-operation was enlisted of the municipal and urban district surveyors and of the police. They were asked to indicate what was the most crowded hour of the most crowded day of the week, and we trusted to their local knowledge to give us a correct answer. It is interesting to know that in most cases both these authorities coincided; where they did not, separate hour counts were taken for comparison.

It will thus be seen that these one-hour counts had behind them the experience of all those local people who were familiar with local conditions, and the resulting plan gives a very accurate picture of the general trend of the main traffic routes and their comparative volume. It was not, of course, suggested that any one count might be made use of as the basis for a detailed road widening. It would have to be supplemented for such purposes by more detailed countings. That this plan was not wholly impractical is proved by the fact that on the suggestion of an engineer to a county borough it has been taken as a basis upon which to discuss the main road proposals that are being prepared by all the local authorities in the area. These proposals are being assembled on a plan, and will form the basis of a discussion on lines similar to those which have produced such good results in Greater London.

I am sure that if the writer of your summary could find time to pay a visit to the rooms of the Manchester Society of Architects, Mr. Percy Lodge, F.R.I.B.A., or any of the other gentlemen who are working on the civic survey, would be only too pleased to show him that the other branches of the work are of equal practicalness with the traffic plan, and because they happen to be well drawn and nicely coloured they are none the less useful. You will agree it is rather disheartening to architects and surveyors who have been giving this work their serious attention for many months to have it dismissed in a phrase as though of no practical utility.—Yours, &c.,

Patrick Abercrombie.
Hon. Director to the Civic Survey of South Lancashire.

Liverpool.
February 2, 1917.

TESTING FACILITIES IN IRELAND.

To the Editor of The Surveyor.

Sir,—Our attention has just been directed to "Notes from Ireland" in your issue of December 29th last, in which your correspondent points out the need of an establishment for testing cement and similar constructive materials in that country, and, further, goes on to suggest that such work might be taken up by the universities or principal technical schools for a small fee.

In the first place, might we point out that we have been established in Westminster for that very purpose for some thirty years past, and in the ordinary course of practice are constantly receiving samples of cement and similar constructive materials from public bodies and others in Ireland for analysis, test and report; as regards any objection that might be raised as to distance we presume that, in normal times, a sample takes no longer to reach London from Ireland than, say, from Limerick to Dublin, or wherever the testing establishment proposed by your correspondent might be situated.

Secondly, with regard to the suggestion that such work should be taken up by the universities or technical schools for a small fee, we cannot protest too strongly against such a course; it is obviously grossly unjust that an endowed or State-aided institution should be allowed to undertake such work at unremunerative rates, and thus compete unfairly with private establishments, which, though specially organised and equipped, have not the

public purse to draw upon to meet their expenses.—Yours, &c.,

HENRY FAIJA & Co.
(D. B. BUTLER).

DECIMAL WEIGHTS, MEASURES, AND COINAGE.

To the Editor of THE SURVEYOR.

SIR,—As an advocate of change I am prepared for ordinary criticism, but Mr. Phillips's letter (in your issue of 2nd inst.) brings in "psychical" weapons that are beyond me, so I decide to refrain from argument, as being unsuitable when his claim for inspiration (even by accident) is to be considered. I must become a believer or remain in outer darkness. Let me become a true believer, and seek comfort from the prophet's words, and I find it thus:—

(*a*) "We (the British) have mixed these natural scales and produced the distracting jumble" (line 37).

(*b*) "As complete and perfect as the French system" (line 43).

(*c*) "As perfect as the metric system" (line 52).

And thus I am confirmed in my original faith by the prophet's words, and I begin to wonder whether it were better to evolve a new and perfect system—using psychic and all other forces to attain that end—or to tolerate the few imperfections of the metric system, and take advantage of the fact that:—

(1) It has been in practical use during seventy years.

(2) It has become supreme in science work.

(3) It has almost displaced all other weights and measures throughout half the civilised world.

(4) Its construction, on a basis of ten, as used in our system of counting, makes it convenient for calculations of every description and for the use of arithmetical machinery and labour-saving devices.

I trust that your readers will decide with me that these four advantages will outweigh any little imperfections, and will join the growing metric host.—Yours truly, &c.,

EDWARD C. BARTON.

February 5th, 1917.

BUILDING MATERIALS AND FUEL ECONOMY.

To the Editor of THE SURVEYOR.

SIR,—I am engaged on behalf of the Committee on Fuel Economy of the British Association in making investigations on the consumption of fuel for domestic heating and other purposes, with a view to economising the national resources. One branch of this investigation has as its object to determine forms of building construction which will reduce the loss of heat through the walls of a dwelling house. In this connection I am endeavouring to compare the heat-retaining effect of different kinds of plaster applied to the inner surfaces of walls.

There must be many inexpensive compositions known to some of your readers, which will probably produce a great effect in this direction. I write, therefore, to ask any such persons who are interested in this most important national problem, and who are in a position to submit suitable samples, to communicate with me at the University College.

We have erected in the laboratories here an apparatus capable of making tests of the exact effect of such plaster, and I should be prepared to submit any samples sent to me to that test if it appeared to offer any prospect of success.

May I request you, therefore, to ask any of your readers to give us their assistance in this nationally important matter?—Yours, &c.,

A. H. BARKER.

Department of Heating and Ventilating Engineering, University College, London.

SIZES OF SEWERS.

To the Editor of THE SURVEYOR.

SIR,—The note under the above heading in your "Scottish Notes" column of January 26th is of interest, and in answer to the writer's appeal for further information I have pleasure in stating that my experience regarding 6-in. pipe sewers corresponds with that of your correspondent. In connection with the first development at Rosyth—within the city of Dunfermline—a similar proposal was made and was rejected for similar reasons.—Yours, &c.,

P. C. SMITH.

Dunfermline. Burgh Engineer.

February 3, 1917.

IRONIES OF NATIONAL SERVICE.

A SURVEYOR'S VAIN SEARCH.

Mr. Donald Maclean, M.P., chairman of London Appeal Tribunal, on Monday, criticised the methods of Government departments, who, one after the other, had declined to avail themselves of the services of a qualified surveyor, passed B 2, who wished to render national service.

"At the suggestion of the Tribunal," said the surveyor, "I made efforts to obtain substitution work suitable to my gifts and training. After applying in vain to one Government department after another I went to the Hotel Cecil, where, having met a private and sergeant, I was referred to an officer, who told me that if 300 jobs were open as many as 3,000 applications were usually received."

Mr. Maclean: Here is a gentleman highly qualified and quite unfit for active military service. He goes from one Government office to another with recommendations and the desire to serve his country in the best way he can by placing his trained intellect and business capacity at the national service. He goes from one hotel or ducal mansion to another, and he is received by privates and sergeants and sergeant-majors, and is passed on and on and on. The result is he comes back with nothing done, and the suggestion to us is that we shall put him into khaki.

Lieutenant Watson: Oh, no; my suggestion is that you should give him another short adjournment to enable him to apply to replace a fit man at the Office of Works.

The Chairman: The real fact of the matter is that heads of departments do not want to be bothered more than they can help, but if they have men fit for service they hold on to them. What is the good of talking about vast schemes of national service when we see here a little bit of the machinery at work? What they want is not vast new establishments, but some common sense, and that they want very badly.

In granting a month's adjournment, Mr. Maclean added: "We will give Government departments another opportunity to utilise a really useful man."

SURVEYORS' INSTITUTION.

PRELIMINARY EXAMINATION, 1917.

The following candidates have satisfied the examiners in the above:—

Messrs. L. G. Alldridge, Birmingham; S. N. Bax, Wincanton; E. E. Beard, Colchester; S. J. Bickford, Burnley; L. Brailey, Plymouth; G. C. Crowley, Stockbridge, Hants; T. G. Daniels, Liverpool; G. Grange, Pateley Bridge; A. T. Greenslade, Pomphlete, near Plymouth; J. W. Hanstock, Upper Batley, Yorks; J. H. Harris, Alverstoke, Hants; L. M. Helmore, Exeter; W. A. Hill, E. Dulwich, S.E. (head of list); E. C. Horne, Hounslow; A. R. Jarman, Hemel Hempstead; R. E. Johnson, Uxbridge; D. E. J. Knapp, Corsham, Wilts; F. B. Marsh, Stroud Green, N.; H. M. Matthews, Lincoln's Inn, W.C.; F. W. Pexton, Scarborough; H. A. M. Prall, Rochester; B. Radclyffe, St. Briavels, S.O., Glos.; D. W. Rees, Penybank, Ammanford, S. Wales; G. E. Turner, Birmingham; E. D. Vinson, Loose, near Maidstone; H. Ward, Bere Alston, Devon.

Damp Cellars.—In these days of street economy a surprisingly large amount of waste results from food stuffs and other materials being stored in damp cellars. The difficulty is easily overcome by the use of a waterproof cement rendering. In the case of the cellars of a mansion at Roehampton, which were very damp, this treatment was successfully applied, the powder "Pudlo" being adopted for the work.

Road Improvement in Birmingham.—A joint conference of the Public Works, Tramways, and Town Planning Committees of the Birmingham City Council was held last week for the purpose of considering the construction of ring and the improvement of arterial main roads and other questions in which the two are severally interested. At the close of a long meeting (says the *Birmingham Post*) it was reported that no definite decision had been come to, and the conference was adjourned to a date to be fixed later.

VENTILATION SHAFTS ON PRIVATE HOUSE DRAINS.

By P. C. Smith.
Burgh Engineer, Dunfermline.

In The Surveyor of January 26th the writer of "Scottish Notes" mentioned that, in connection with more than one housing scheme recently undertaken in Scotland, ventilating shafts have been left out of the separate house drainage systems: the writer at the same time expressed the belief that the Dunfermline City Council were the first to allow this in connection with the operations of the Scottish National Housing Company at Rosyth.

The accompanying drawings will best explain the situation. At a conference which took place between the architects of the Scottish National Housing Company and the writer previous to the plans of the houses being submitted to the Dean of Guild Court the question was put: "Will you insist on every separate house being separately connected to the sewer, and must each water-closet have a ventilation shaft?" This arrangement involved a disconnecting trap, with a trap on the bath waste, another on the sink waste, and a yard trap, with 18 ft. of 4-in. ventilation pipe in addition.

As the sewers run behind the houses, and within 10 ft. of the back walls, the writer saw no use for a ventilation shaft. In addition, as each pair of houses lent themselves to a combined system of drainage, the writer agreed to drain the houses in pairs. The disconnecting trap is close to the sewer, having a "two-way" piece to take in the water-closet drains. The back inlet of the trap takes in the rest of the drainage, which is gathered into one trap at the wall foot. The trap is a low back syphon with "two-way" piece and

"bell" top to take the rain water conductor and the yard water. The bath and sink wastes are brought into the same cast-iron wastes and discharged into the side of the trap.

By this method, which is giving every satisfaction, and has been copied elsewhere, five traps and 36 ft. of ventilation pipe are saved, to say nothing of the appearance of the back wall, which would have been anything but beautiful with a series of 4-in. pipes stuck up against it.

Local Government Board and the Dublin Municipal Workshops.—The Local Government Board have written to the Dublin Corporation intimating that a number of complaints have been received respecting the management of the Stanley-street workshops, and requesting a sworn inquiry into the matter. The board ask for a copy of the findings of the corporation special committee as soon as possible.

A Natty Pen Clasp.—Messrs. M. Butler & Co., of 12 Bridge-street, Belfast, are the sole suppliers of an exceedingly neat and ingenious fountain-pen clasp, which they call the "Up-to-date." Our illustration, which is full size, gives a clear idea of it. The monthly calendar, which is interchangeable, is protected by a celluloid window, through which the dates are easily legible. The clips are made for pencils (to which they act also as point protectors) as well as fountain-pens, the only difference being in the circumference of the spring clip which holds the pencil or pen. "Natty" is perhaps the most expressive word to apply to this novelty, which is sold at 1s. post free.

East Sussex County Council and German Prisoners.—At the meeting of the East Sussex County Council on Tuesday last, Major Thornton, on behalf of the Roads and Bridges Committee, stated that the War Office had refused to accede to the employment of German prisoners of war by the committee. The committee would have liked to employ the men on the Seaford and Newhaven road in view of the unsatisfactory work of the conscientious objectors. There was, observed Major Thornton, not much to get out of the conscientious objectors in any shape or form.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Should we not take seriously the notes of warning that have been sounded as to the serious menace to London's health due to the non, or irregular, collection of house refuse? In some boroughs the refuse, owing to depleted staffs, has been allowed to accumulate for several weeks. Most of the flats and smaller houses are provided with only one sanitary dustbin of limited capacity, and when this is filled recourse has to be had to any receptacle, which too often means to one open to the air. This often stands on the footpath edge for days, and, as well as being a menace to health, is a dangerous obstruction in our unlighted streets. Should this state of things continue into the warmer months, shall we not be inviting a plague of flies and the dangers of their helping to spread disease?

* * *

Has not the time come to make serious efforts to encourage cremation by facilitating it and cheapening it? A few days ago undertakers were in serious difficulties owing to the dearth of grave-digging labour and the impossibility of getting sufficient coffins, of which there is no reserve to draw upon. Fortunately, a slight fall in the death-rate relieved the pressure for the moment, but the position would be truly serious if there were any sort of epidemic to deal with. Cremation, of course, is the proper solution, and we had hopes that it would receive an impetus through the absolute necessity for its use at the Front. But the impetus has been slight indeed, though perceptible. Should not the undertaking trade be taken over by the sanitary authorities, and they alone be responsible for the disposal of the dead, charges being fixed by statute and based upon the deceased's assessment? Might we not see the dawn of cremation for all if the law provided that no private grave be dug for the reception of a body, and that private graves be sold or opened only for the deposit of urns containing ashes?

* * *

Mr. *Punch's* discerning eye has detected the following in a Liverpool paper: "A large section of the city will find its water supply rather intermittent in consequence of a burst of the Rivington water main at Twig-lane, Huyton, near Prescot. The main has an internal diameter of 44 miles." "What an awful bore!" is our contemporary's laconic comment. Certainly a circumference of some 135 miles is unusual for a main in this country. Have they anything to beat it in America?

* * *

What did the member of the Rural District Council of Barnstaple mean when he suggested that their surveyor must have the patience of Job to allow of his being "ransacked" and tackled by councillors? Had this member been studying his Southey, who in one of his poems says, "To ransack every corner of their shifting and fallacious hearts"? Has the surveyor got a heart of this description?

* * *

Did not the excellent articles in the Special Annual Issue of THE SURVEYOR of January 26th upon "Municipal Engineering in 1916" give us much food for thought? Is not the field of municipal engineering a very wide one, and are not the problems which have to be solved in connection with the matters so ably set forth in these articles, matters which are of really world-wide importance? Is it not to be hoped that, when this terrible war is over, the general public will realise the importance of the work of the municipal and county surveyor, and that these officials will at last receive proper recognition of their valuable services to mankind?

* * *

Would it not be better for the agricultural success of this country if our farmers had more capital, and more scientific training, and required less interest on their capital outlay? Is it a fact, as stated in America, that the outcry of more men "back to the land" is quite out of date, as with improved agricultural machinery, more capital, and larger fields, the annual labour of only two men will produce enough wheat to feed 1,000 of their fellow men? Why can't we do something of this kind over here? And will Mr. Prothero take note of this query if he should happen to see it?

* * *

When the war is over, how are we going to set about the reinstatement of our roads and streets? How are we going to meet the growing shortage of housing

a considerable part of the population? What are we going to do to save the present waste of the valuable products found in our house refuse? Shall we be able to separate and use the various constituents of sewage? Shall we be able to economise in our present wasteful, small and independent electricity installations, and gather them together in more economical groups? Will transport be simplified in connection with extraordinary traffic and other complicated and congested areas? Will all the town planning schemes now so much talked about be set in hand? And finally where is all the money coming from to effect these very desirable improvements?

NOTES FROM IRELAND.

SPECIALLY CONTRIBUTED BY AN IRISH CORRESPONDENT

[In the hope of making these notes as practically useful as possible the writer invites readers to favour him with communications thereon from time to time. They might be constructively critical, or helpfully supplementary, might indicate new points upon which information is desired, or might merely convey information. Communications will reach the writer if addressed "Irish Notes," 24 Bride-lane, Fleet-street, E.C.]

Sanitary Condition of Smaller Towns and Villages.

The sanitary condition of a large proportion of the smaller towns and villages in Ireland is not satisfactory. A few of the towns have been provided with both a pure water supply and a modern and complete system of sewerage. The great majority of the towns are perhaps now supplied with a good and sufficient water supply, but a number of towns and many villages are still without a proper supply, while in many of the towns and villages the sanitary conditions are in other respects extremely bad. In recent years, owing to the pressure brought to bear on the sanitary authorities by the Local Government Board, and the appointment of surveyors by the urban councils, and by some of the district councils who are the rural sanitary authorities, a good deal has been done, and many of the worst cases of impure water supplies and defective sewerage systems have been, at least to some extent, remedied; but there is a vast amount of work still to be done before the towns and villages can be described as being in a thoroughly clean and good sanitary condition.

* * * *

In spite, however, of defective sewerage systems, and in the cases impure water supplies, the health of the majority of the inhabitants is not perhaps as bad as might be expected, but the prevalence of chronic sore throats in some of these towns, and other characteristics of ill-health are evidence of a tainted atmosphere and possibly a polluted water supply. The death-rate also in these places, though perhaps not excessive, is considerably greater than the average rate in towns in England and Scotland.

* * * *

Lack of Sewage Disposal Works.

In Ireland most of the towns of over 1,500 inhabitants are now governed by urban councils, while the sanitary affairs of the smaller towns and villages are looked after by the district councils. In a few of the small towns a complete system of sewerage with sewage disposal works have been established, but in the majority of cases no proper system of sewage treatment is in operation, and comparatively few have adopted a system designed so that each new sewer laid and completed part of a scheme which, when finished, will form a complete system of properly laid and properly proportioned sewers leading to ground selected for disposal works. In the case of the villages the instances in which a complete scheme of sewerage and sewage disposal works have been constructed are still rarer.

* * * *

In some villages pipe sewers have been laid by the district councils in connection, and there are usually proposals for discharging into the nearest watercourse; but as the cost of piping the drainage from yards and houses either into the sewer or into the nearest watercourse is often the principal or only reason why a house is not connected with a local ditch or drain, it is understood that the surface-water drains laid by the county councils in their performance the grand juries. These surface-water drains are in some cases of the open variety laid and bonded with cement, and in many cases discharge into a large volume of water where no nuisance is likely to arise from a small flow of sewage, there seems little objection to leaving junctions along these pipes and permitting householders in the village to connect their premises with the county pipe. In this way a duplicate system of sewers and drains is avoided; and a good deal of expense is saved. Where, however, the county surface water drains are built of rubble masonry, or are fireclay pipes indifferently laid, and with puddle joints, or in cases where the pipes discharge at an outfall where a nuisance would be caused by the admixture of sewage with the surface water, it is evident that a separate system must be established for dealing with the sewage of the town or village.

* * * *

An Administrative Difficulty.

It is rather to be regretted that, while the roads and streets in these towns and villages are in the charge of the county surveyor, the sanitary work is looked after by the engineer to the district council. There seems, however, no reason why these two officers should not meet occasionally and arrange for the carrying off of both sewerage and surface water by the same system of pipes where possible. It would be found that the district councils would be much more willing to pass proposals for work which would serve the double purpose than where, as at present, they are sometimes called on to approve of a proposal for a surface-water pipe and at another time for a sewer. In these places disposal works for the treatment of the sewage are seldom absolutely necessary, and in some cases are indeed not required, but in those places where treatment is required the flood water could easily be discharged at the outfall by an automatic arrangement, while the dry-weather flow could be suitably treated.

* * * *

Domestic Sanitation.

It is not, however, at the outfall, but at the other end of the system, that nuisances usually arise—in the want of any sanitary accommodation of any sort in many houses, in privies, in back yards, in badly paved yards the soil of which is saturated with manurial matter from various animals, in the absence of proper gullies and of channels leading to them, in the practice of throwing out slops of all sorts at either the back or front door of the houses, and in many other ways. Every medical officer of health and sanitary officer no doubt does his best to have nuisances abated in his own district, but in too many instances these efforts are thwarted by influences which it is unnecessary to name, by the apathy of householders and by the difficulty there is in getting them to appreciate the great benefit to be derived from healthy surroundings.

* * * *

It seems improbable that any great improvement will be effected in the sanitary condition of these small towns and villages until a medical officer of health is appointed for each county. This officer should have full power of inspection of all premises, with power to prosecute offenders on his own initiative. In the event of any householder failing to carry out an Order made against him, the medical officer of health should then be empowered to get the necessary work done, so far as the removal of any existing nuisance or the provision of external sanitary work might be required, and to recover the cost of so doing from the offender. It would be a great advantage if every sanitary authority had a complete and well-thought-out system of sewers laid off on a large-scale map for each small town and village within their area. Then, instead of the constant cleaning out and repairing of old masonry sewers and surface-water pipes and the laying of new pipes in portions which might, presumably, be found useless in connection with the carrying out of a complete scheme for any of these places, proposals could be approved of each year by the district and county councils concerned for the laying of a certain length of pipes forming part of a combined scheme for the proper drainage of each small town and village. In this way, instead of laying surface-water pipes and sewers indiscriminately as at present, or of borrowing a large sum to carry out a complete system at once in any particular place, a scheme could be executed by degrees, and at no greater cost in many cases than is at present incurred in laying pipes which may be sufficient for the moment, but which are not designed to form part of a combined scheme of drainage for the place and which would presently become useless when it became necessary to carry out extensions or to provide a complete scheme.

Recent Practice in the Purification and Softening of Public Water Supplies.*

By FRED C. UREN, M.Inst.C.E.I., Surveyor to the Aldershot Urban District Council.

Open sand filters for artificially purifying public water supplies have now been in use for nearly a hundred years, and so deep was the conviction of their hygienical efficiency that the design remained unaltered for nearly one-half of that period. The conditions of working have, however, received considerable attention from engineers of recent years.

The action of the filter so well known to all water engineers is that after two or three days' use a slimy deposit of organic matter is formed on the surface of the sand containing algæ and various forms of bacteria which effect considerable bacterial purification. Until this scum has been formed a sand filter is, however, not considered to be in a fit condition for effective use, and in order to reduce the ineffective period, clogging is sometimes induced artificially.

In this film 98 per cent of the bacteria in the water is arrested; nitrification also takes place, with its consequent disintegration of the organic matter.

When the sand becomes too clogged to pass the water at the required rate (usually from 4 in. to 6 in. of descent per hour, or 50 to 75 gallons per square foot per day of twenty-four hours), under a moderate head, a thin film of sand is removed, averaging about 1 in. in thickness, until the bed is reduced by successive parings to about 12 in., when it is restored to its original depth. The interval between the scrapings varies from a few days to several weeks, according to the condition of the water, the fineness of the sand, and the period of the year. The amount of water used for washing varies still more, ranging as it does from 3 per cent to 0·3 per cent, while the cost of cleansing averages from 6½d. to 7d. per cubic yard of sand in many British works.

Of course, this clogging of the surface, whether natural or forced, is attended with a practical disadvantage in the working of the filter, and it has long been recognised as one of the greatest drawbacks to slow sand filtration.

MULTIPLE FILTRATION.

"The interest aroused in connection with this subject has resulted in the formation of two distinct methods of practice based on widely divergent theories. On the one hand, those who support the theory that the bacterial purification of water by filtration is chiefly due to the mechanical action of straining have developed the mechanical filter, in which a film is created artificially by the use of a

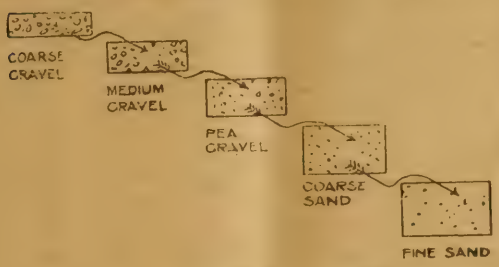

Fig. 1.—Multiple Filtration.

coagulant, and a high speed is adopted. On the other hand, Armand Puech proved by experiment and observation that the formation of a film on the surface of a filter was a hindrance rather than an aid to purification, and Puech and Chabal have developed the system of multiple filtration, which is founded on the now ascertained fact that the formation of a film, either natural or artificial, on the surface of the filtering medium is unnecessary and undesirable. In the system of multiple filtration the slow sand filter is retained, but the water is previously clarified by passing through successive layers of gravel and sand. (See Fig. 1.) During this preliminary treatment all solid matters in suspension are eliminated, together with the spores of algæ, so that no film can form on the surface of the final filter. As the nitrifying bacteria are not retained on the surface of the sand, they penetrate into the filter itself to a considerable depth, so that the bed becomes an active agent of purification, and not merely a support for the filtering layer of limited efficiency on its surface. Yet it is found that slow sand filters, which form the final elements in a system of multiple filtration, will, without the formation of a film, give far better results chemically and bacteriologically than filters on which a film is allowed to form."†

Fig. 2 gives a diagrammatic section through an installation at Bamford, Derbyshire, which deals with water from the impounding reservoirs at Derwent and Howden. It has a capacity of 12,000,000 gallons per twenty-four hours, and consists of three series of degrossisseurs divided into sixteen compartments, any one of which may be isolated for cleaning without interrupting the working of the remainder.

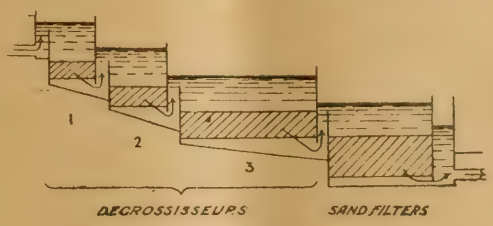

Fig. 2.—Multiple Filters at Bamford.

There are no pre-filters, and the water passes direct from the degrossisseurs to the slow sand-filters. The degrossisseurs are fitted with an apparatus for cleaning the gravel by means of air, and the amount of labour required for working the installation is very small. The sand filters have a total filtering surface of 189,000 sq. ft. The speed adopted is as follows:—

Degrossisseurs, series 1	21·62
,, ,, 2	15·04
,, ,, 3	5·75
Sand filters	0·5

There is usually a large amount of acidity in the raw water, due to the peat in the drainage area, and it is found that the acid increases after heavy rains.

The degrossisseurs series 1 and 2 contain crushed limestone as the filtering medium, which has been found to effect complete neutralisation of the peaty acids in the water. In the third series the filtering medium is screened calc spar, and Leighton Buzzard sand is used in the final filters. Although in this particular installation the system of multiple filtration has only been partially adopted, the result of preliminary straining through three successive layers of gravel is to increase the life of the final filters between scrapings from four and a-half to nearly six times, with a resulting saving in labour.

The working expenses for the year 1913 amounted to 4s. 6d. per 1,000,000 gallons, or 0·054d. per 1,000 gallons. These figures include the cleaning of the degrossisseurs, with maintenance of the oil engine and blower used in cleaning, scraping of sand filters, &c.

It is usual to speak of the system as triple filtration, but there may be as many as six series of filters in a plant dealing with a very turbid water, as at Cawnpore, Accra, Magdeburg, &c. The object to be attained is to supply the sand filters with a physically clear water. As is well known, except in rare instances filtration plants dealing with river waters are supplied with decanting basins or settling tanks, which occupy much space, and the cost of which has to be added to that of the filters. In the case of multiple filters, settling tanks should not be necessary. The total area of sand filters, roughers, and pre-filters should not exceed the area of sand filters alone when these are supplied from settling tanks, and the efficiency of the sand filters is far greater.

* From a paper read at a meeting of the Institution of Civil Engineers of Ireland on Monday last at Dublin.

† W. Clemence on "Theory and Practice in the Filtration of Water." Institution of Mechanical Engineers, April 1916.

MECHANICAL FILTRATION.

Mechanical or high velocity filtration has its origin in the United States, where the sources of supply are commonly [illegible] rivers heavily charged with suspended matter, which clog the slow sand filters.

From these unusual conditions which governed their initial use, it is stated that quite 70 per cent of the water supply of America is now filtered by this means.

Their introduction into this country began about twenty years ago, and they are now being used to such an extent that it is necessary for engineers to recognise their applicability, and as far as possible their deficiencies, in the purification of water.

They may be divided into two groups. In the first are those in which the water is run under pressure with or without previous chemical treatment through sand or proprietary material in a closed filter of iron or steel plate, as in the case of the Candy, Reeve, Bell and Jewell pressure filters.

The second class comprises filters in which water sometimes previously treated is run through sand or proprietary material in open tanks, but under a pressure which is considerably greater than that used in the slow sand beds, as in the Mather and Platt, and the Paterson open filter and the Jewell gravity filter. The filtering medium in all except the Candy filter is sharp, silicious sand or crushed quartz, to the depth of 3 ft. or 4 ft. in the filter.

Except in the three following, with which the author has been directly associated, sulphate of alumina is used as a coagulant, in order to increase the filtering capacity of the sand. This precipitate, which is deposited on the surface of the sand (in pursuance of the surface film theory), fixes the colouring matter, and entangles the suspended matter and bacteria present in the water.

From a half to two grains of sulphate of alumina is used, the amount depending on the quality of the water. By means of specially designed appli-

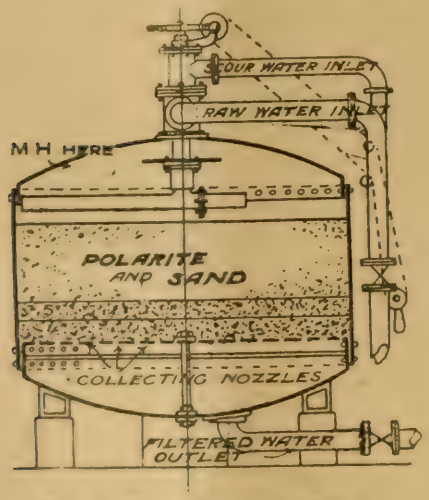

Fig. 3.—Candy Single-bed Filter.

[illegible] the amount of alumina can be admitted with a fair degree of accuracy, proportionate to the amount of water dealt with.

Cleansing is usually required after twelve to twenty-four hours, though the efficiency of the filtering medium may remain unimpaired for several days in treating comparatively clear water. The cleansing, which takes about twelve minutes, is accomplished by reversing the flow of water, and causing it upward through the several layers, and thoroughly scouring the whole.

The Candy Filter.—In the compound and single variety, are filled with proprietary substances known as polarite and [illegible], both largely composed of [illegible] oxide of iron and of silica, the latter being harder and less readily disintegrated than the former. Both substances are porous, in- [illegible] and absorbing.

The diagram (Fig. 3) shows the closed steel cylinders containing the various layers of filtering media. The water is admitted to the air chamber, [illegible] by compressed air, and thoroughly mixed with atmospheric oxygen before passing to the first section of the filter.

It then passes to the second layer where the iron is converted from the soluble bicarbonate into the soluble hydrated ferric oxide. At this stage the water has parted with the greater portion of suspended impurities, and there is thus little for the third layer to do beyond removing the precipitated oxide. The water issues from the filter bright, clear and palatable. The success of the filter appears to depend upon the effectiveness of the polarite layer.

The second type of filter made by Messrs. Candy is that by which a minute dose of chlorine is added to the water by which they claim to remove all pathogenic or fæcal bacteria from water intended for domestic consumption. The chlorine is mixed with the water, allowed to remain for some time in contact with it, then afterwards removed by passing it through an insoluble dechlorinating agent.

At Reading these filters work at the rate of 32,000 gallons per square yard per day, or eighty times the usual rate of sand filters.

The Ransome Continuous Filter.—A distinctive feature of this filter is the use of a gradually moving body

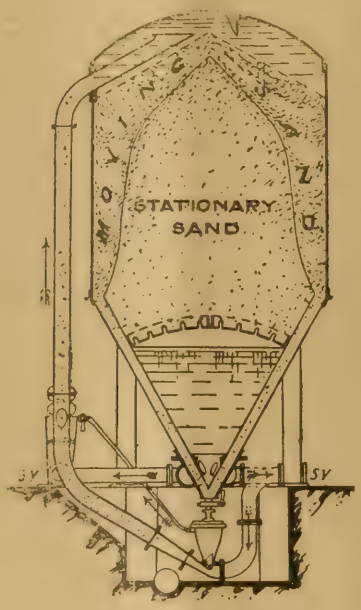

Fig. 4.

of sand as the primary filtering medium. The moving sand forms in itself a perpetual series of filtering films and, governed by its angle of repose, gravitates grain by grain towards the washing chamber at the base of the filter, whence, after thorough cleansing, it is continuously raised by the incoming water, and redeposited upon the top of the moving sand at the filters' apex.

This feature admits of an increased rate of filtration and necessitates backwashing of the medium once in about forty days only.

In addition to the moving sand there is, as shown in the section (Fig. 4), a stationary cone-shaped body of graded sand, quartz and gravel, which forms the final filtering media, and by its shape adds greatly to the capacity of the filter. The cone, as a matter of fact, is two and three-quarter times the horizontal area of the filter. This, coupled with the absence of mechanical parts, enables the filters to be grouped together more economically, less space is required, and the cost of necessary buildings reduced.

It can be equally advantageously employed with the use of coagulants, or with liming apparatus as a combined softening and filtration plant, and for the removal of iron.

The Turn-Over Rapid Filter.—Compared with the other rapid filters undoubtedly the important feature of this type is the method of cleansing the bed. It has the added advantage, too, that somewhat less head is required for cleansing and working, and the process of cleaning is not dependent upon a supply of water under high pressure, as the bed is cleansed by turning it over in the water contained in the chamber, and only a slight reversed flow of water is required, whilst the turning movement is supplied by a small water motor, gas,

or oil engine. The filtering medium consists of clean crushed quartz crystals, which does not require renewal.

It is scarcely necessary to go further into mechanical details, as these do not govern the results to any appreciable extent and we are after all chiefly concerned with the results obtained from the filters in general.

In the removal of suspended matter from the water there can be no question of the efficiency of mechanical filters; that they render the water clear, as tested by the 2-feet tube, is testified by many observers throughout the country.

The efficiency of the mechanical filter must be measured by the character of the water to be treated. In the case of deep well water, for example, where it is already bacterially pure, treatment may be required only for the removal of the iron found in solution which attacks all metallic iron with which it comes in contact, choking the mains and discolouring the water, and impairing its usefulness for industrial purposes.

Here the installation of mechanical filters may be all that is necessary. In the process the water must be aërated to cause oxidation and precipitation. In the Candy filter, which is in use for this purpose at Hastings, Tunbridge Wells, Cromer, Hooton and other places, the aëration is conducted within the filter.

Taking Hastings as an example of a highly ferruginous water, though otherwise pure, on account of the iron in solution and suspension it was extremely difficult to keep the sand bed filters in condition. The surfaces soon became coated with a layer of oxide of iron,, which more or less sealed the beds, and necessitated frequent skimming, at a cost of from 0·08d. to 0·1d. per 1,000 gallons; recourse was then had to larger beds and an increased depth of sand, but in 1899 a battery of six mechanical filters was installed, and in 1902 four more, for which the Local Government Board granted a loan repayable in thirty years.

The crude water was turbid and discoloured, and contained nearly one grain of hydrated oxide of iron per gallon. After filtration it was colourless, yielded no deposit, and practically the whole of the iron in solution and suspension was removed as well as the free and albuminoid ammonia.

The cost of filtering per 1,000 gallons was 0·012d. to 0·025d.; the quantity of water used for washing the pressure filters ranged from 0·38 to 0·5 per cent. A similar experience was met at the Hooton works of the West Cheshire Water Company, where the iron oxide reduced the bore of the mains from 1 to 3 per cent per annum, and millions of gallons of water were used in main flushing to get rid of the discoloured water.

In 1906 my friend P. H. Bettle, who was then acting for the company, advised an installation of mechanical filters, which was duly acted upon, and although the water contained ·5 grain of iron per gallon prior to filtration, after treatment no trace of it could be found. The same measure of success has been attained at Crewe, Tunbridge Wells, and Biggleswade.

As regards the removal of peaty colouring matter, the mechanical filter with the aid of the alumina appears from the examination made by careful and accomplished observers to act more efficiently than slow sand filters.

Professor Delepine, in making observations on the filtration of moorland water supplies by means of mechanical filtration and coagulants, stated that the water which before treatment varied in colour from greenish or brownish yellow to brown and dark brown, was invariably deprived entirely, or almost entirely, of its colour. The results of thirty-two examinations of the treated water gave the following results:—On twenty occasions it had a clear blue colour, and on twelve a greenish blue colour; in the latter cases more than 95 per cent of the original yellow or brown discoloration had been removed.

In the case of plumbo-solvent waters generally associated with moorland water supplies the removal of peaty acids is imperative. Whenever water exhibits an acid reaction, it may be regarded as plumbo-solvent. This term refers to the action of certain natural waters on lead. Natural waters seldom dissolve lead, but the addition of storm water may render them active, especially if part of the drainage comes from moorland. The action of peaty water is frequently rapid; as much as two grains per gallon can be dissolved in a few minutes.

The comprehensive examination by the Local Government Board of moorland supplies in Yorkshire was due to the numerous reports as to the effect on consumers. To counteract the action, neutralisation may be carried out by the addition of lime or carbonate of soda which in the process of mechanical filtration is added in sufficient quantity through a measuring or chemical supply gear to neutralise the acidity and at the same time react on the alumina forming the coagulant.

As regards the bacterial efficiency of mechanical filters, Frankland showed that an average of 95·7 per cent purification was obtained with a year's weekly samples, the unfiltered water containing from 45 to 793 bacteria per cubic centimetre, the water being obtained from an upland source not exposed to pollution.

At York, where mechanical filters are used for preliminary treatment before filtration through slow sand filters, the average reduction in the water (which is obtained from the Ouse) was 86·2 per cent without the use of a coagulant; but with the addition of 1 grain of sulphate of alumina per gallon in an experiment lasting six days an average reduction of 93·37 per cent was the result.

At Bolton Radcliffe found in a series of weekly examinations, extending over fifteen months, that the average reduction of bacteria was 95·6 per cent where the water contained from 52 to 793 organisms per cubic centimetre.

(To be concluded.)

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor readers with a view to making the information given under this head as complete and accurate as possible.

APPLICATION FOR LOAN.

Bury T.C.—£2,000 for the installation of toluol extraction plant.

LOANS SANCTIONED.

Walthamstow T.C.—£18,790 for the extension of the electricity works.

Woolwich B.C.—£23,152 for further extensions at the electricity works.

Timber, Plywood, and Woodwork.—In next week's issue there will appear a page advertisement which will give various particulars of timber, plywood, and woodwork which Messrs. C. Jennings & Co. have for sale. The page will be found useful for reference by all who make use of such goods. The firm's head office is at Pennywell-road, Bristol, but they have branches at Leicester, Porthcawl, and stocks warehoused at Swansea, Hull, Pembroke Dock, Neyland, Newcastle, Manchester, Liverpool, and elsewhere.

Criticism Brings Vote of Confidence.—At last Monday's meeting of St. Andrews Town Council, on the motion of Colonel Thomson, the Standing Orders were suspended in order that he might move a vote of confidence in the burgh surveyor, Mr. Wm. Watson. The Colonel (reports the *Dundee Advertiser*) said that in the eight or nine months he had been in the council he had noticed a steady stream of criticism directed against the town's officials. This applied especially to the burgh surveyor, whose position was such that he was unable to defend himself. On different occasions the allegations had been found to be wrong, and yet neither apology nor withdrawal had been made. He thought the best way to meet the situation would be by passing a vote of confidence in their surveyor, whom he considered was a good public servant and conscientious worker. Dr. M'Tier seconded. Bailie Hall said he would like to associate himself with the motion. Mr. Watson was a very capable official. Bailie Reid said all the attacks had emanated from the same two men. The motion was unanimously agreed to.

"Subscriber for Twenty Years" writes: "I congratulate you, Mr. Editor, on the excellent annual number of 'The Surveyor,' notwithstanding the war. It is much better than one could reasonably expect—indeed, the annual summary or review is quite one of the best. I usually keep it at my elbow for purpose of reference, not only in the latest law notes and engineering practice, but as a ready list of advertisers, the names and addresses of practically all the firms needed in one's work being found therein.

Municipal Work In Progress and Projected.

The Editor solicits the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars have reached us during the present week. Other reports will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Brixham U.D.C.—It was stated that the breakwater had stood the recent violent gale in a most satisfactory manner. The structure, it was added, had not only been made without any charge upon the rates, but £1,000 out of the harbour funds could be put in the War Loan, thus showing it was a sound undertaking.

Burnley T.C.—The town council decided on Wednesday to accept the offer of the Carnegie Trust of £15,000 towards the cost of providing a central free library.

Dundee T.C.—Under the direction of the city engineer, Mr. J. Thomson, it is proposed to build a piggery in reinforced concrete at Ashludie sanatorium, at an estimated cost of £250.

Glasgow T.C.—A report has been prepared on the effect of certain provisions of the Building Regulations Act, 1900, in regard to the building of dwelling-houses, and it will be submitted at the next meeting of the corporation.

Northumberland C.C.—The council have approved a scheme for dealing further with tuberculosis. Three new dispensaries will be provided, and 111 beds in existing institutions, the cost being £12,582.

Torquay T.C.—It was reported that the annual sum required to pay principal and interest on the loan for the new town hall amounted to the product of a 2½d. rate, reducible by £150 per annum saved in the rental of premises formerly occupied as offices, and the receipts from the lettings of the new town hall estimated at £200 per annum.

HOUSING AND TOWN PLANNING.

Birmingham T.C.—The city council on Tuesday last resolved to make application to the Local Government Board for their approval to the East Birmingham town planning scheme amendment scheme, 1916. It was stated that important development schemes were being considered in committee.

Dublin T.C.—In connection with the proposed American loan, the city architect has, at the request of the Dublin Corporation Housing Committee, revised the estimates for the various schemes proposed to be carried out. The revision has been made necessary by the increased cost of materials and labour. It represents roundly an increase of 25 per cent on the original estimate. The revised cost of the different schemes is as follows: McCaffrey estate, £66,812; St. James'-walk, Rialto, £15,375; Fairbrother's Fields, £200,250; completion of Ormond Market area, £11,102; Spitalfields (amended scheme), £52,243. In connection with the Fairbrother's Fields scheme, the city architect has prepared a revised outline plan, which is to include provision for baths and wash-houses and a reading-room. Provision is to be made on the best frontages for houses which could be let for about £26 a year.

Waterford T.C.—The Housing Committee recommended the acceptance of the tender of Mr. George Nolan at £4,613 for the erection of nineteen work[illegible]

MOTOR TRANSPORT.

Batley T.C.—The question of purchasing a motor lorry for the gas works is under consideration.

Halifax T.C.—A motor van is to be purchased for municipal purposes at a cost not exceeding £190.

REFUSE COLLECTION AND DISPOSAL.

Scalby U.D.C.—The Sanitary Committee have left it to the surveyor to arrange with residents in the district requiring the services for the removal of old pots, pans, and dry ashes for a period of three months as an experiment at a charge of 1s 6d a load.

ROADS AND MATERIALS.

Ballichorough (Cavan) R.D.C.—The council have adopted the county surveyor's recommendation to bring the direct labour scheme into existence.

Barry U.D.C.—The Public Works Committee are preparing an estimate of the cost of constructing the main roads with clinker.

Belford R.D.C.—The council have agreed to the suggestion of the surveyor, Mr. T. W. Dodd, that, failing better supplies of 2½-in. metal, he should obtain chippings (if available) on a larger scale than formerly, and tar these as required.

Cavan R.D.C.—The county surveyor estimated the probable expenditure on roads during the coming year at £10,070, while the legal limit of expenditure was only £7,800. The council decided to request the Local Government Board to sanction the increase of the limit to £10,000.

Eastbourne R.D.C.—The council have instructed the clerk to communicate with certain brewery companies claiming compensation for damage done by tractors to the road from Long Bridge to Exceat Farm.

Edinburgh T.C.—The Streets and Buildings Committee have decided, with a view to ascertaining if any further saving could be effected, to stop all new work in the roads and burgh engineer's departments until it had been surveyed and reported upon.

Grantham T.C.—The Highways Committee presented at the last meeting the estimates of expenditure on main roads and footpaths for the year ending March 31, 1918, amounting to £1,292. This included £2,096 due to making good roads which have been damaged by extraordinary military traffic. The committee reported that to carry out the various work on the roads would necessitate a start being made as soon as the weather is favourable, and as there will no doubt be the utmost difficulty in getting material and labour, the borough surveyor has been granted full power to order the material at once, and to take all steps necessary to expedite the work.

Hull T.C.—The city surveyor, Mr. F. W. Bricknell, reported to the Works Committee that the estimated expenditure on scavenging was £22,970, about £1,000 in excess of last year's estimate. That was largely owing to the increased cost of provender for the horses and to the war bonuses that were being paid. They were employing rather fewer men and carts than did the private contractors.

Kesteven C.C.—The county surveyor, Mr. W. B. Purser, presented to the Highways Committee estimates of expenditure on main roads for the year ending March 31, 1918, amounting to £29,817, as against £27,309. The increase, he said, was almost entirely due to the extraordinary military traffic in and near Grantham. Notice had been given to the Road Board, and he had no doubt that a considerable contribution would be given towards this extra expenditure. The Leasingham and Lincoln main road was repaired during the heavy traffic at a cost of £2,627, and the Road Board had paid the entire cost. It was now proposed to reinstate the whole length in the urban and rural district at a cost of £4,634, of which the Road Board will recommend the payment of £3,631, provided the county council agree to carry out the works included in the estimate.

Kingsbridge R.D.C.—It has been agreed to cut down by one-half the estimates for stone required on the district roads.

Lancaster T.C.—The borough surveyor, Mr. A. G. Bradshaw, has received instructions to repair part of Heysham-road with water-bound macadam, at an estimated cost of £375.

Newry No. 1 R.D.C.—The county surveyor of Down, Mr. J. Heron, has made arrangements by which each direct labour surfaceman is to have charge of certain roads and to work on them on fixed days of the week. The district council have therefore been furnished with a register of surfacemen, showing the road upon which each man is to work on each day of the week.

Northumberland C.C.—It is proposed to employ a number of German war prisoners at the county quarry at Knowles Gate, where three sheds will be built for the accommodation of the men, who will be under the control of the military.

Plympton R.D.C.—The Prisoners of War Employment Committee have written stating that, owing to the very large demand for this labour for work of the

most urgent national importance, they regret it is impossible to make any allocation of prisoners of war for road maintenance work. On the other hand, the Road Board state that the War Department are considering a scheme by which local authorities will be able to apply direct to the commandant of the nearest prisoner of war camp in order to obtain gangs of prisoners for work by the day upon the understanding that the prisoners are only available for a short period, and are likely to be withdrawn at very short notice. The district council would therefore clearly see that the employment of prisoners of war on work of road maintenance cannot be relied on.

Salop C.C.—The council, it was reported on Saturday, have now only one workman for each 7 miles' length of road, instead of three, while much of their material for road repair was being commandeered.

Stockton T.C.—The town council have agreed to repair the roadways over the three North-Eastern Railway bridges in Yarm-road, at a cost not exceeding £600, to be met by the railway company.

SEWERAGE AND SEWAGE DISPOSAL.

Cheltenham T.C.—The Public Health Committee recommend the reconstruction of the brick sewer in Commercial-street, at an estimated cost of £320.

Rugby R.D.C.—With respect to complaints about polluted wells at Hillmorton, the Local Government Board have written inquiring whether the wells are to be closed, and hoping that the council will consider the provision of an improved system of sewerage for the parish as soon as circumstances will permit.

Wath R.D.C.—The sanitary inspector has received instructions to prepare specifications for an improved sewerage system for Rainton.

Wath U.D.C.—A proposition to engage Mr. J. H. Drew, borough surveyor of Grantham, to superintend, for a sum of £180, the completion of the sewage works extension scheme, which he engineered when he was surveyor to the Wath Council, has been referred to a special meeting of the council.

WATER, GAS, AND ELECTRICITY.

Barrow T.C.—The corporation are seeking to obtain additional water from the River Duddon, and have lodged a Bill in Parliament. When a Bill was promoted a few years ago, there was opposition from mining and iron companies, but on this occasion there is no opposition on these counts, but the Bootle (Cumberland) Rural District Council and the Ulverston Rural District Council are to oppose the measure.

Islington B.C.—It is proposed to provide an additional feeder main at the electricity works at an estimated cost of £4,000.

Shoreditch B.C.—The borough electrical engineer has prepared a scheme for the installation of a turbo-generator set at Whiston-street electricity works, at an estimated cost of £11,000.

Todmorden T.C.—The Electricity Committee recommend the installation of a 1,000-kw. turbo-generator, with auxiliaries, at an estimated cost of £10,000.

MISCELLANEOUS.

Belfast T.C.—The Improvement Committee have allocated 20 acres of land at the outfall works for allotments, and 26 acres of land at Sydenham Station.

Dublin T.C.—In a report by the Municipal Estates and Finance Committee it is stated that a proposal referred to them by the city council to increase the wages of full-time municipal employees from 25s. to 30s. per week, rising to 35s., would involve an increase of £18,500 on the estimates. The committee refuse to accept the responsibility for whatever action the city council take with respect to the matter.

St. Helens T.C.—The borough engineer, Mr. A. W. Bradley, has issued leaflets offering land for allotments at nine points in the borough—300 sq. yds. at a rent of 1s. a year, with seed and manure at cost price. The allotments have been taken up by a large number of people.

York T.C.—The accounts of the tramways and motor omnibus services for the last financial year showed receipts amounting to £35,735, leaving a nett surplus balance of £11,202.

The Decimal System.—East Sussex County Council on Tuesday adopted a recommendation of the Weights and Measures Committee supporting in principle the decimal system of weights, measures and coinage in the United Kingdom.

SOCIETY OF ENGINEERS.

PRESENTATION OF PREMIUMS.

At a meeting of the Society of Engineers, held on Monday last, the premiums awarded by the council for papers read before the society during 1916 were presented by the retiring president, Mr. Percy Griffith, M.INST.C.E., F.G.S., as follows:—

The President's Gold Medal to Prof. C. G. Cullis, D.SC., for his paper on "The Mineral Resources of the British Empire as regards the Production of Non-Ferrous Industrial Metals."

The Bessemer Premium, value £5 5s., to Prof. W. G. Fearnsides for his paper on "The Mineral Requirements of the British Iron and Steel Industries."

The Bernays Premium, value £3 3s., to Prof. J. A. Fleming, M.A., D.SC., for his paper on "Engineering and Scientific Research."

The Nursey Premium, value £3 3s., to Mr. J. E. Lister, Wh.Ex., ASSOC.M.INST.C.E., A.M.I.M.E., for his paper on "Modern Coal and Coke Handling Machinery, as used in the Manufacture of Gas."

The Society's Premium, value £2 2s., to Mr. Ewart S. Andrews, B.SC., for his paper on "The Design of Continuous Beams."

Mr. Henry C. Adams, M.INST.C.E., M.I.MECH.E., F.R.SAN.I., president for the year 1917, was then invested with the badge of office, and delivered his presidential address, in which, after touching on the long connection which he, his father, and grandfather had had with the present society and its forerunners, the old Society of Engineers and the Civil and Mechanical Engineers' Society, he pointed out the desirability of some federation of engineering bodies, and the disadvantages to the profession and the public of the present multiplication of specialist societies having in many cases almost identical objects and interests. He then outlined a scheme for such a federation with a general engineering council for its head, and representing all sections of the engineering profession, the specialist societies being co-ordinated and forming in effect branches of the main body. This general council would wield enormous power both in moulding public opinion and in upholding the status and interests of the profession as a whole. He then dealt with the classification and training of engineers, and the great need for the more general recognition of science in all branches of education, and called attention to the important memorandum on the neglect of science signed by many eminent men which was published in the *Times* of February 2, 1916, and the subsequent meeting, where resolutions were passed recommending the Government to assign capital importance to the natural sciences in the competitive examinations for the Home and Indian Civil Service and for admission to Sandhurst. In conclusion, he suggested that the time is opportune for the reform of our present system of weights and measures and the adoption of the metric system.

Liverpool Tramway and Electricity Profits.—Liverpool Tramways and Electric Lighting Committee have decided to vote £125,000 from the tramways receipts towards the relief of the rates, and £65,000 from the electrical undertaking for the same purpose—a total of £190,000. Last year the tramways contributed £100,000 to the reduction of the rates.

Salford's Allotments.—The question of land cultivation in Salford is engaging the attention of a committee appointed by the Salford Corporation. Mr. Platt, the building surveyor, at the request of the mayor (Councillor Higson), prepared a plan showing that, apart from park land, there were about 800 acres of land unoccupied in various parts of the borough. Unfortunately, in many parts the soil is regarded owing to its shallowness, as being quite unsuitable for the cultivation of vegetables.

The Coroner's Pigsty.—On Wednesday, at Braintree, the urban district council had before them plans sent in by Dr. J. Harrison, the East Essex Coroner, for a model pigsty, which he intended to erect in the ornamental gardens opposite his residence in Bank-street, a narrow thoroughfare in a congested area. It was decided to suggest to the coroner that his model sty could be built in the gardens at the rear of his house, and that if he desired it publicity could be obtained by erecting an advertising board in his front garden.

PERSONAL.

Mr. E. Wilton, acting deputy borough surveyor of Deptford, has been appointed surveyor to the Beddington and Wallington, Surrey, Urban District Council.

Mr. Langton, municipal engineer of Lahore, has taken up service in the Army, and Mr. Hukumchand, municipal sub-engineer, has been appointed to act in his place.

Mr. William Newbigging was on Wednesday last appointed temporary consulting engineer to the Manchester Corporation Gas Committee, at a remuneration at the rate of £1,000 per annum.

Mr. T. J. Wheeler has been appointed deputy-surveyor to the Ottery St. Mary Urban District Council during the absence of the surveyor (Mr. H. Finister) on military service.

Major A. T. Davies, the county surveyor of Shropshire, who has been on active service and has been wounded, was welcomed back to duty last week by the members of the county council.

Mr. T. Moulding, city surveyor of Exeter, was on Tuesday last voted an increase of his salary from £600 to £700 per annum, in recognition of increased duties through the extension of the borough.

Mr. John R. Mead, borough engineer and surveyor of Ipswich, has received permission from the town council to take up a commission in the Royal Engineers for road service in France, under Brigadier-General Maybury.

Mr. M. S. Stobbs, acting county surveyor of Shropshire, has been granted an honorarium of £100 for his special services during the absence of the county surveyor on military service. His salary has also been increased so as to bring it at the end of the year to £400.

Mr. F. S. Cutler, Assoc.M.Inst.C.E., deputy borough engineer, having rejoined the Royal Engineers, the whole of the technical and clerical staff of the borough engineer of Deptford, Mr. F. Wilkinson, Assoc.M. Inst.C.E., are now with the Forces, Mr. Wilkinson being the only member of the department for whom the council has applied for and been granted exemption.

Mr. A. Rothera, surveyor to the Spenborough Urban District Council, will receive the sympathy of his many friends on account of the sad death recently of his little son Cecil, who was accidentally killed by a motor wagon. Another son, a few years older, had a narrow escape, being also thrown under the wagon, and he is suffering from severe scalp wound and shock.

Mr. J. Jackson, superintendent of the Birmingham refuse disposal department, has had his salary increased from £500 to £550 a year. It was stated that Mr. Jackson had remodelled the work of his department, and introduced various schemes which had resulted in pecuniary benefit to the corporation. The sorting and sale of waste paper alone would bring in £500 a year, while the treatment of old tins represented a further revenue of many hundreds a year.

Bath Surveying Committee on Monday last had before them the report of a Special Committee appointed to consider the question of the surveyorship. It was agreed that it was inadvisable at the present time to appoint a successor to the late Mr. C. R. Fortune; that Mr. F. E. Gay continue in the position of acting city surveyor at a salary of £400 per annum; and that the matter be reconsidered when the offices of waterworks engineer and city surveyor can be amalgamated, with a view to the appointment of a city engineer. It was stated that the feeling of the Special Committee was that it was essential in the public interests that there should be two officials doing the work of the Waterworks and Surveying Committees. In many towns the offices were amalgamated. As long as the present occupants of the two offices were alive and well the question of amalgamation would not arise. But in the nature of things the opportunity would arise some time, and then the committee would be prepared to act.

OBITUARY.

Mr. David T. Ryan, architect and civil engineer, who had charge of the buildings and properties with which the Aberdeen burgh surveyor's department have to deal, died last week, we regret to state. He enjoyed the confidence and esteem of all connected with the municipal work of Aberdeen.

We regret to report the death, after a long illness, of Mr. Richard Collins, surveyor to the Enfield Urban District Council. Mr. Collins, who was 63 years of age, had been in the service of the local authority for some 25 years.

Mr. H. Howard Humphreys, M.Inst.C.E., will have the sympathy of a wide circle of friends in the engineering profession in the loss of his wife, whose death, we regret to learn, took place on Monday last at 19, Prince of Wales Mansions, S.W.

News has just been received at Exeter that Mr. Donald Cameron, who for many years occupied the position of surveyor to the Exeter City Council, and who now holds an important appointment in British Columbia, has lost his son—Sapper Euan Cameron who was attached to the Royal Naval Division. Deceased, with six other brothers, on the outbreak of the war held lucrative appointments in North Vancouver, British Columbia, but they resigned their posts, proceeded to England, and joined the Colours to play their part. They all went through the Gallipoli campaign, and then proceeded to France, where they saw a deal of fighting. Six of the sons of Mr. Cameron who joined the Colours are Lieutenant Angus Cameron, Lance-Corporal Ivan Cameron, Sappers Colin Cameron, Hamish Cameron, E. D. Cameron (killed), and H. J. Cameron. The other brother is serving with a Canadian regiment. From a letter received by an Exeter resident it appears that Euan received the wound from which he died on November 13th. The letter in question says: "Euan was in part of the Big Push—a ghastly three days. He was away up in the German lines with a lieutenant, trying to keep the Brigade Headquarters in touch with the fighting. His wire was the one wire which kept up during one long, terrible day, and by which the staff got the news that the fighting was going in our favour, and not, as rumoured, that our forces had been cut up and were in confusion. The Staff Captain said it was marvellous the way in which the wires had been kept up."

"Studs" on Road Engine Wheels.—The Local Government Board have issued as a temporary war measure an Order enabling the driving wheels of an agricultural locomotive to be provided with studs while it is being used on a frost-bound road.

Disposal of Destructor Waste Scrap at Hornsey.—With reference to the article under this heading which appeared in our issue of January 26th last (p. 123), we understand that the hydraulic scrap bundling plant installed at Hornsey was made by Messrs. Hollings & Guest, Limited, Thimble Mill-lane, Birmingham.

FOR OTHER ADVERTISEMENTS
See End of Paper.

BOROUGH OF COLNE.

The Highways and Sewerage Committees of the Borough of Colne are prepared to receive Tenders for the Supply and Delivery of the following Materials for the year ending 31st March, 1918:—

Lancashire and Local Setts, Kerbs, and Channels.
Portland Cement. Pitch and Creosote Oil.
Granite and Limestone Macadam.
Earthenware Pipes and Gullies.
Lime. Brushes.
Ironwork (Street Grates, Manhole and Lamphole Covers).
Leading Limestone. Team Labour.

Specification and Form of Tender and other information may be obtained on application at the Office of the Borough Engineer and Surveyor, Mr. T. H. Hartley, and Tenders addressed to the Chairman of the Highways and Sewerage Committees, properly endorsed, must be delivered to the above-named not later than 9 a.m. on Monday, the 19th inst.

The Committees do not bind themselves to accept the lowest or any Tender, and persons tendering must do so at their own cost.

(By order)
ALFRED VARLEY,
Town Clerk.

Town Hall, Colne,
Lancs.
February 7, 1917. (3,298)

SOME RECENT PUBLICATIONS.*

Knight's Local Government Reports. January, 1917. Vol. xv., No. 1.

We take the opportunity afforded by the appearance of the first number of a new volume of these excellent reports to commend them to those of our readers who desire to peruse fuller reports of law cases affecting their work than are to be found in the various "digests" that appear. It may safely be said that any municipal engineer who subscribes to "Knight's L.G.R." and receives his monthly issue will keep himself thoroughly abreast of all legal decisions which affect him in his professional capacity. Every report is prefixed by a full headnote, so that the gist of the case can be grasped at once by those who have not time or inclination to read the full judgments. The monthly issues also embody local government statutes and relevant orders and circulars issued by the Local Government Board and other Government Departments.

Water Supply. By William P. Mason. Fourth Edition. Price 16s. nett. New York: John Wiley & Sons.

The fourth edition of Professor Mason's well-known book on Water Supply testifies to the high esteem in which this book is held by the American engineering public. Published originally in 1896, it has passed through subsequent editions, each time being substantially enlarged and improved. For the present edition a large amount of the text has been entirely rewritten, and a suitable amount of new material added. The tables have been brought up to date and new photographs introduced.

Professor Mason is always a pleasing writer, and has the art of abstracting the important data from the writings of others, and presenting them in an attractive form. Although this cannot be called an exhaustive treatment of the subject it is one of the most interesting and suggestive treatises on the subject published since the old book of the same title by Professor William Ripley Nichols, of the Massachusetts Institute of Technology.

Municipal Engineering Practice. By A. Prescott Folwell. (First Edition.) Price $3.50. New York: John Wiley & Sons.

The increasing interest the United States takes in municipal affairs, and especially in city planning, has induced the author to bring together in one volume many matters which relate to municipal engineering practice in that country. He has done this in a very interesting way, and has covered the ground very thoroughly for a book of small size. Altogether this chapter is one of the best short discussions on city planning to be found in recent literature. The book is exceedingly well printed and profusely illustrated.

Work of Glasgow Fire Brigade.—During 1916 the Glasgow fire brigade received 1,549 calls, a decrease of 291 compared with the previous year. The fires due to defective building construction were numerous, the number being 246, or 35·2 per cent of the total. The lengths of hose used during the year measured about 22 miles. The expenditure of the department during the year ended on May 31, 1916, was £31,418, excluding interest and sinking fund, and the revenue was £6,669, making the nett charge on rates £24,748, or 239d. per £1. The sum received from proprietors and others for the attendance of the brigade to fires within the city boundaries amounted to £4,428.

Huddersfield and Housing: Proposed Works Department.—At the last meeting of Huddersfield Town Council Mr. Boothroyd brought forward a proposal that a committee be appointed to consider the advisability of establishing a works department for the carrying out by direct labour of all building and repairing work. In the course of a long discussion, Alderman Blamires suggested that the proposal should be limited to the appointment of a committee to consider the advisability of establishing the department in relation to housing alone, which was the pressing need of the moment. The suggestion was accepted, and it was resolved that the committee should be appointed accordingly.

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

head coal bunker, coal conveyor, and structural steelwork, for the corporation.—Mr. G. Wilkinson, borough electrical engineer, 33 Swan-road, Harrogate.

Mechanically Propelled Vehicles.

HERTS.—February 12th.—For the hire of steam and petrol rollers, for the county council.—Mr. J. S. Killick, county surveyor, County Surveyor's Office, Hatfield.

MANCHESTER.—February 19th.—For the supply of one or more motor sweeping machines, for the Cleansing Committee.—Mr. R. Williamson, superintendent, Cleansing Department, Town Hall.

Roads.

BIRKENHEAD.—February 12th.—For the supply of granite and Rawlestall kerbs and channels, Penmaenmawr macadam, stone and natural flags, and stoneware pipes, for the corporation.—Mr. C. Brownridge, borough engineer and surveyor, Town Hall, Birkenhead.

BUCKS.—February 12th.—For the supply of clean, hand-picked road flints, for the county council.—Mr. E. Winfield, acting county surveyor, County Hall, Aylesbury.

MUTFORD AND LOTHINGLAND.—February 12th.—For the supply of granite, flint, gravel, and path shingle, for the rural district council.—Mr. H. Blewett, surveyor, Council Offices, Oulton Broad, Lowestoft.

WALTHAM ABBEY.—February 12th.—For tar-spraying about 7,000 sq. yds. of roads, for the urban district council.—Mr. W. C. Holloway, engineer and surveyor, Town Hall, Waltham Abbey.

NORTHUMBERLAND.—February 12th.—For supplying, breaking, and carting stone, for the county council.—County Surveyor, Moothall, Newcastle-on-Tyne.

LONG SUTTON.—February 13th.—For the supply of granite, slag, and granite chippings, for the urban district council.—Mr. S. S. Mossop, clerk, Long Sutton, Lincs.

LEYLAND.—February 13th.—For the supply of broken granite, broken slag, tar-macadam, limestone dust, kerbs, setts, rubble, concrete flags, earthenware pulleys, drain pipes, and irregulars, for the urban district council.—Mr. M. H. Wilkinson, surveyor, Council Offices.

HOLLAND.—February 14th.—For the supply of about 3,750 tons of broken granite, 1,904 tons of granite chips, 2,250 tons of slag, 200 tons of slag dust, 200 loads of coarse builders' sand, and 400 barrels of cement, for the county council.—Mr. W. H. Gane, County Surveyor, Boston, Lincs.

BIRMINGHAM.—February 14th.—For the supply of about 3,500 tons of coal-gas tar, for the corporation.—Mr. H. E. Salter, city engineer and surveyor, Council House.

CORNWALL.—February 14th.—For the supply of materials, carting, team labour, and purchase of sidings and paddocks, for the county council.—Assistant County Surveyor, Clinton-road, Redruth.

SUTTON.—February 14th.—For the tar-spraying of the footpaths, for the urban district council.—Mr. W. H. Gaffer, Municipal Offices, Sutton, Surrey.

CLAYPOLE.—February 15th.—For the supply of 1,500 tons of granite, 1,200 tons of slag, and 140 tons of footpath gravel, for the rural district council.—Mr. C. G. Fox, district surveyor, Brant Broughton, Newark.

COULSDON.—February 15th.—For the supply of bituminous tar, tarvia, tar-spraying materials, tarred tar-macadam, kerbing, pitching, channelling and setts, at paving, Portland cement, broken granite, stoneware pipes, cement, and horse hire, for the urban district council.—Mr. E. J. Gower, clerk, Council Offices, Purley, Surrey.

NEWMARKET.—February 15th.—For the supply of about 1,000 tons of the best broken Leicestershire granite, 1½-in., and 2½-in. gauge, 200 tons of best broken slag, 2½-in. gauge, 400 tons of granite or slag chippings, free from dust, ¼-in. gauge, and 250 tons of ¾-in. screened granite chippings, for the urban district council.—Mr. W. H. Eley, engineer and surveyor, Town Hall, Newmarket.

WETHERBY.—February 15th.—For the supply of material to be carted in accordance with the Road Board specifications, for the rural district council.—Mr. E. H. Cooke, clerk, Rural Council Offices, Wetherby, Yorks.

BELVOIR.—February 17th.—For the supply of materials and carting, for the rural district council.—Mr. R. J. Kettlebarrow, district surveyor, Normanton, Bottesford, Notts.

BEDS.—February 17th.—For the supply of broken granite, slag, flints, gravel, and cartage, for the county council.—County Surveyor, Shire Hall, Bedford.

BANBURY.—February 17th.—For the supply of best hand-picked and broken granite, for the rural district council.—Mr. H. Gauder; surveyor, Adderbury West, Banbury.

RUGBY.—February 17th.—For the supply of granite and carting, for the rural district council.—Mr. J. W. Pendred, clerk, Council Offices, Rugby.

HORSHAM.—February 17th.—For the supply of about 15,000 gallons of tar, for the rural district council.—Mr. W. Dengate, surveyor, 58 Park-street, Horsham.

THAKEHAM.—February 17th.—For the supply of broken basalt or granite, unbroken flints, and refined tar, for the rural district council.—Mr. W. Forrester, surveyor, Storrington, Pulborough, Sussex.

KINGSBURY.—February 17th.—For the supply of Leicestershire granite and granite chippings, ironstone slag, Derby limestone, broken pit or dug flints, hoggin, shingle cartage, and tar-spraying, for the urban district council.—Mr. R. C. N. Newport, surveyor, Council Offices, Kingsbury, Middlesex.

FORFAR.—February 17th–21st.—For quarrying and carting breaking materials for the highways, for the Forfar district.—Mr. A. Lindsay, 12 Reform-street, Kirriemuir.

SOUTHAM.—February 19th.—For the supply of about 3,000 tons of granite and 250 tons of best blue broken slag, for the rural district council.—Mr. H. Pickering, surveyor, Pickering, Southam, Warwickshire.

WANSTEAD.—February 21st.—For the supply of cartage and team labour, for the urban district council.—Mr. B. Blewitt, clerk.

BOLSOVER.—February 21st.—For the supply of granite, limestone, slag, basalt, tarred limestone, tarred slag, refined tar, pitch, kerb, channel, sand, and stoneware pipes, for the urban district council.—Mr. J. F. Wardle, town surveyor, Council Offices, Bolsover, near Chesterfield.

BRIDGNORTH.—February 22nd.—For the supply of granite and slag, for the rural district council.—Mr. F. Richards, surveyor, Council Offices, Bridgnorth.

MARPLE.—February 23rd.—For the supply of granite macadam and chippings, Macclesfield macadam and chippings, 6-in. grit stone setts, and sanitary pipes, for the urban district council.—Mr. D. J. Diver, surveyor, Council Offices, Marple.

ROTHERHAM.—February 24th.—For the supply of granite slag and tarred macadam, for the rural district council.—Mr. R. Bradbury, district surveyor, Imperial Buildings, Rotherham.

KEYNSHAM.—February 26th.—For the supply of granite slag, tarred macadam, and limestone, for the rural district council.—Mr. J. Johnson, district surveyor, Surveyor's Office, Keynsham, Somerset.

BREDBURY AND ROMILEY.—February 26th.—For the supply of setts, macadam, and other highway materials, for the urban district council.—Mr. Albert Plunkett, surveyor, Council Offices, Schoolbrow, Romiley.

CHESHIRE.—February 28th.—For the supply of macadam, tar-macadam, and chippings, for the county council.—Mr. W. Holland, county surveyor, The Castle, Chester.

CHESHIRE.—February 28th.—For the supply of refined tar, Tarvia, or Tarco, for the county council.—Mr. W. Holland, county surveyor, The Castle, Chester.

DORCHESTER.—March 2nd.—For the repair of the district roads for one year, for the rural district council.—Mr. J. J. Estridge, highway surveyor, Bleak House, Maumbury Way, Dorchester.

DURHAM.—March 3rd.—Tenders are invited for a second-hand No. 1 Smith hot-mixer plant for the making of tar-macadam.—Mr. Albert E. Brookes, county surveyor, Shire Hall, Durham.

CHAILEY.—March 22nd.—For the supply of about 2,980 yds. of flints, 2,550 yds. of granite or other stone, and 60 yds. of gravel, for the rural district

council.—Mr. C. Patrick, clerk, Union Offices, West-street, Lewes.

Sanitary.

ROCHFORD.—February 12th.—For the removal of house refuse, for the rural district council.—Mr. W. H. Roberts, clerk, 40 Clarence-street, Southend-on-Sea.

LAMBETH.—February 12th.—For the use of a shoot, wharf, or jetty, and for barging away therefrom of refuse, for the borough council.—Mr. H. Edwards, borough engineer, Town Hall, Brixton Hill, London, S.E.

LEEDS.—February 13th.—For the supply of press filter-cloths at Knostrop sewage works, for the Sewerage Committee.—Sewerage Engineer, Great George-street, Leeds.

BLAYDON-ON-TYNE.—February 13th.—For the removal and disposal of refuse, for the urban district council.—Mr. R. Biggins, Council Offices.

ROTHWELL.—February 16th.—For the removal of refuse and the supply of team labour, for the urban district council.—Mr. E. F. Moorhouse, sanitary inspector, Council Offices, Rothwell, near Leeds.

DARLINGTON.—February 17th.—For the scavenging of certain parishes, for the rural district council. —Mr. G. L. Bowron, Union Offices, Darlington.

AYLESBURY.—February 17th.—For the collection of refuse, for the rural district council.—Mr. R. T. S. Stewart, sanitary surveyor and inspector, Council Offices, 21 Walton-street, Aylesbury.

LEWISHAM.—February 20th.—For the supply of horse hire and removal of house refuse, for the borough council.—Borough Surveyor, Town Hall, Lewisham, London, S.E.

SMALLTHORNE.—February 28th.—For scavenging the Packmoor area, for the urban district council.—The Sanitary Inspector, Smallthorne, Staffs.

Stores.

HALIFAX.—February 12th.—For the supply of materials for the tramways department, for the corporation.—Tramways Engineer, Tramways Offices, Skircoat-road, Halifax.

FINSBURY.—February 12th.—For the supply of scavenger brooms, paints, pitch, creosote, sand, ballast, and stoneware goods, for the borough council. —Borough Surveyor, Town Hall.

BIRMINGHAM.—February 12th.—For the supply of granite kerbs, setts, crossing stones, chippings, flags, paving bricks, wood-paving blocks, ragstone, limestone, tarred limestone, tarred roadstone, gravel, sand, slag, lias lime, Portland cement, and stoneware pipes, for the corporation.—Mr. Henry E. Stilgoe, city engineer and surveyor, The Council House, Birmingham.

BELFAST.—February 13th.—For the supply of earthenware sewer pipes, timber, slates, hardwood, iron castings, plumber's work, nails, iron and steel, paints, oils, glazing, mill furnishings, shovels, spades, graipes, buckets, scavenging brushes, glazed bricks, artificial flags, lime, pitch, felt, tar, sea sand, sea gravel, Lough Neah sand, cement, uniform clothing and hats, for the corporation.—Mr. Hector F. Gullan, superintendent of works, City Hall, Belfast.

Forms of Tender and Specifications can be obtained from the undersigned.

Tenders, endorsed "Supply of Road Material," are to be delivered to F. G. Whittuck, Esq., Clerk to the District Council, Keynsham, on or before Monday, the 26th February next.

The Council do not bind themselves to accept the lowest or any Tender.

J. JOHNSON,
District Surveyor.

Surveyor's Office,
Keynsham.
February 6, 1917. (3,293)

DISTILLED TAR
for spraying, grouting or macadam.
First-class uniform quality complying with the specifications of the Road Board.
BROTHERTON & Co. Ltd. LEEDS
WORKS—Middlesbrough, Stanningland, Wakefield, Workington

The Surveyor

And Municipal and County Engineer.

Vol. LI. FEBRUARY 16, 1917. No. 1,309.

Minutes of Proceedings.

Accidental Obstructions on Highways.

The recent case of *Hudson and Another* v. *Bray* (noted in another column) is of considerable interest to highway surveyors. It was an action for damages for personal injuries sustained by the plaintiffs, and injury to their motor car, by collision with a fallen tree belonging to the defendant, which was blown down during the night, in a gale, and fell across the road at a point where it passed through a deep cutting. From early morning until dark on the following day the road foreman of the county council and two of the defendant's men were engaged in trying to remove it, but without success. When it became dark, the defendant's men left the place, intending to bring a light, and during their absence the plaintiffs drove along the road in their motor car and the accident occurred. The judge of the Bishop's Stortford County Court held that the defendant had been guilty of negligence in omitting to light or guard the obstruction, and gave judgment for the plaintiffs. But he was overruled by the King's Bench Divisional Court on the ground that, although the defendant might have been guilty of "wilful obstruction" under sec. 72 of the Highway Act, 1835, in the event of his failing to remove the tree after notice from the highway surveyor he was under no obligation either to light or to guard it pending its removal.

This decision, taken in conjunction with the *dictum* of the court as to "wilful obstruction," suggests two questions. In the first place, could the defendant have been compelled to remove the tree? It will be remembered that under sec. 26 of the Act of 1835, "if any impediment or obstruction shall arise in any highways from accumulation of snow, from the falling down of the banks on the side of such highways, *or from any other cause*," the highway authority must, within twenty-four hours after notice from a justice of the peace for the county, cause the same to be removed. We believe we are right in saying that there is no express provision in the Act empowering the authority to require a landowner to remove an accidental obstruction. The *dictum* of the court, above referred to, however, is supported by the case of *Gully* v. *Smith* (12 Q.B.D., 121). In that case a highway passed through a deep cutting, and the adjoining land was supported by a retaining wall, a portion of which (owing to the exceptional wetness of the season and the pressure of the bank) subsided and fell on to the road, forming a dangerous obstruction. The highway surveyor gave notice to the landowner to remove it, which, however, he failed to do. He was then summoned, under sec. 72 of the Act, for "wilful obstruction" and convicted, the conviction being affirmed on appeal. But we do not think it would be safe to rely upon this decision as a precedent in every instance of an obstruction caused by accident. There is an obvious difference, for instance, between the fall of an artificial construction, such as a retaining wall, and the uprooting of a tree by natural causes. Moreover, it appears that in *Gully* v. *Smith* the wall was very badly constructed, and it is probable that this was an important factor in the case. In *Hudson and Another* v. *Bray* the court laid stress on the fact that the blowing down of the tree was an "act of God," for which the defendant was not liable. Moreover, it is to be noted that the *dictum* in that case was merely *obiter—i.e.*, not essential to the decision—and also that it is strictly guarded. The court did *not* say that the defendant *would* have been guilty of wilful obstruction had he failed to remove the tree after notice, but only that he *might* have been. The second question suggested is whether it was the duty of the highway authority to light or guard the tree. As we have seen, they would be bound to have it removed within twenty-four hours after notice from a justice of the peace for the county under sec. 26 of the Act. That section is silent on the subject of lighting or guarding the obstruction, and we are unable to cite any authority on the point, but we venture to suggest that it would be prudent for the authority to take all reasonable precautions against accidents pending the removal of the obstacle, whether any notice has been given by a justice of the peace or not.

* * *

An Important Statute.

The recently enacted Defence of the Realm (Acquisition of Land) Act, 1916, which empowers Government departments to purchase lands of which they have taken possession during the war, is a statute of far-reaching importance. Indeed, the comparatively limited amount of public attention which it has received is only due to the present overwhelming concentration on

matters which are directly connected with the immediate prosecution of the war. As Mr. Edwin Savill pointed out in the course of his excellent exposition at the last meeting of the Surveyors' Institution, the far-reaching consequences of the Act may be gauged from the fact that 150,000 acres of land have been taken over since the beginning of the war, and that the annual value of buildings acquired during the same period is approximately £2,500,000 sterling. The main object of the Act is to protect the State against the loss it might have incurred owing to the fact that buildings of various kinds erected on land belonging to private owners, possibly with valuable machinery attached, would in the ordinary course have reverted to the owners of the land. The first section of the Act provides for Government departments continuing possession after the war of lands of which possession has been taken during the course of the war or within the week immediately preceding its commencement. The period of continued possession is two years, or, with the consent of the Railway and Canal Commission, a further three years, making five years in all. Owners of property may be at some disadvantage, inasmuch as no provision is made for the occupying department at the termination of the war to give notice that occupation is to continue. Presumably, therefore, occupation will automatically continue unless and until notice is given determining it. Sec. 2 gives the occupying department the right to remove buildings or works erected for purposes connected with the war. The next section is probably the most important in the whole Act, for it deals with the purchase of land, and, unlike the preceding sections, which come into force only on the termination of the war, it came into force immediately on the passing of the Act.

One or two of the later provisions of the Act have a special interest for municipal engineers. For example, sec. 6 (3) provides that, where under powers conferred upon the military authorities any public highway has been closed, it may not remain closed after the expiration of twelve months after the termination of the war except with the consent of the Railway and Canal Commission, who, before giving such consent, shall hear the public authorities interested. The provisions of sec. 7, too, are worthy of note, for it deals with water and lighting, and under certain conditions allows companies to continue to supply outside their areas. Sec. 11 deals with streets, buildings, or works which are contrary to the provisions of local by-laws, and under it the local authority has power by order to cause alterations to be carried out to make the buildings comply with the by-laws or to order their removal after they have passed into private hands. The owner, however, has the right to appeal to the Local Government Board. It is impossible in the limited space at our disposal to do justice to the Act as a whole. Enough has been said, however, to show that municipal engineers should study its provisions, and in doing so they can hardly hope for a better guide than is afforded by Mr. Savill's excellent paper.

American Roads.

In 1904 the American Office of Public Roads adopted the policy of conducting at five-year intervals an investigation to determine the mileage of improved and unimproved roads in each State, the expenditure for road purposes, and other related data. The importance of such an investigation in a country large tracts of which are still in a comparatively early stage of development can hardly be over-estimated, and the department are certainly acting wisely in pursuing the matter in spite of many difficulties. The nature of these difficulties is apparent from the report of the 1914 investigation, a copy of which is before us. It appears that in many places the records were found to be so indefinite or so incomplete that the most careful investigation failed to determine even the bare total of what funds had been expended on roads and bridges during the previous years. Lack of definite data and records by the local sub-divisions was found to be even more pronounced as to road mileage. Hundreds of instances were discovered where the local officials could give no more than a rough estimate, as maps had not been prepared or measurement of the roads been made. The tables comprised in the report show some striking comparisons between the figures for 1904 and 1914. For example, the total revenue applied to roads and bridges in the various States has been increased from about 80,000,000 dollars in the former year to 240,000,000 dollars in the latter, the precise percentage increase being 201·75 for the ten-year period. One of the most interesting tables is that which shows the relation of road and bridge revenue to mileage, area, population, and assessed valuation, 1914 and 1904. From this it appears that, while the revenue available for road purposes increased from $37·01 per mile in 1904 to $98·22 per mile in 1914—an increase of 165 per cent.—the actual financial burden upon the taxpayers did not increase in the same ratio. This was due to the fact that property values increased during the same period to such an extent that, whereas the average tax burden per $100 of assessed property value was 23 cents in 1904, it had increased to only 35 cents in 1914, an increase of 52 per cent, or less than one-third the rate of increase in the road fund. Another table shows the total and surfaced mileage of roads in the various States on January 1, 1915, with comparative information for 1904 and 1909. On the date mentioned there was in the United States a total of 2,445,761 miles of road, of which 257,291·54 miles, or 10·52 per cent, were surfaced. This does not include the streets in incorporated cities and towns. By comparing these figures with those obtained in former investigations, it appears that between 1909 and 1914 66,824 miles of road were surfaced. The general result is that great progress in highway construction and improvement is shown to have been made during the past decade—progress which reflects the general prosperity of the country.

The Royal Institute of British Architects and Civil Life.

It is a good thing to get and keep in touch with realities, and it is therefore a welcome sign to find the Royal Institute of British Architects taking a new departure in its professional outlook. Recently Prof. Lethaby submitted for the consideration of the members of the institute "Architecture and Civilisation," the keynote of which may be crystallised in the following pregnant sentence—viz.: "They thought in words and talked of architecture and fine designs, and style in art, and so on, but they did not seem to notice with their eyes how little of things they got in the real streets of the real towns they knew." Of course, Prof. Lethaby does not impute to his professional brethren a lack of ordinary observation, and that would not be in accordance with patent facts. What he seems to suggest is that, while among them observation and criticism are extensive, they fall short of the power of translating these qualities in terms of the realities of life as we know and live it. Thus we find him insisting that professionally architects need a sense of citizenship, of public order, of national spirit. This is a common enough reproach, for, unfortunately, most of us lack the idea and the spirit of the only true citizenship that counts. But the worthy professor was addressing his fellows, and with commendable courage he told them plainly that they needed these things for themselves, "and he ventured

to say the institute needed a collective outlook and purpose. It should be more than a large group of people of one calling; it needed to become the faculty of that part of civilisation which was concerned with planning and building." How was this to be achieved? Prof. Lethaby did not confine himself to generalisation, but instead proceeded to lay down a series of definite propositions which he appealed to architects to think out for themselves, with the object in view of arriving at basic facts and utilising these for the advancement of the civic life. The institute, he argued, should concentrate on a positive constructive policy, directing its education to the same end as the public welfare. Prof. Beresford Pike, who joined in the subsequent discussion, crossed the t's and dotted the i's of the opener's contention by remarking that it was for the members of the institute as artists to throw themselves into the movement for civic reform, "and break down the distinction which existed between the Royal Institute of British Architects and the municipal engineer and surveyor." It is one of the significant and helpful signs of the times that such a discussion as this should have been initiated, and we are hopeful that it may bear good fruit in due time. At all events, it is not to be allowed to stop here, for on the motion of Mr. H. V. Lanchester it was agreed to convene a further meeting to consider the course of action to be taken to give effect to the views enunciated.

* * *

The County Councils Association.

The annual report of the County Councils Association for 1916, which has just been issued, shows, as might have been expected, some limitation in the normal activities of that body in consequence of the prevailing war conditions. On the other hand, some new activities have been undertaken in consequence of the increasing recognition and appreciation of the assistance which can be rendered by local authorities in the administration of internal affairs and the consequent tendency towards greater decentralisation. Our readers will probably be most interested in that part of the report which deals with roads and vehicles. It will be recollected that the Treasury Retrenchment Committee, reporting with regard to the Road Board, recommended that the proceeds of taxes earmarked for the service of the board should be retained in the Exchequer during the war. This recommendation was acted upon, and it was further intended to make no distribution of the accumulated funds in the hands of the board. However, the latter question was re-opened at the request of the association, and witnesses were heard by the committee in support of the contention that some part at least of the accumulated funds should be used for the purposes for which they were originally intended. The Retrenchment Committee ultimately withdrew their previous decision, and in their Final Report recommended that such advances be approved by the Treasury as are in their opinion and that of the Road Board required in order to prevent serious deterioration of roads of real importance. In pursuance of this recommendation it was agreed that, during the financial year 1916-17, new grants or loans for road crust improvements, to an aggregate sum not exceeding £200,000, might be made out of the surplus to the credit of the Road Improvement Fund.

Reference is also made in the report to the clause in the Local Government (Emergency Provisions) Act, which prohibits the establishment of new omnibus routes, except under certain conditions. Other important matters with respect to damage to highways are, however, in suspense. Thus, the Departmental Committee on Locomotives and Heavy Motors (Damage to Roads) has not yet been able to present its report, while the Joint Select Committee on the subject of the liability of motor omnibus companies to contribute to the cost of road maintenance has not yet been appointed. It seems that these questions, which were hitherto regarded as being of pressing importance, will have to wait for consideration until after the war.

Road Openings in United States.

In another column will be found an article from the pen of Mr. Arthur H. Blanchard, in which he discusses the reasons for the present unsatisfactory status of road openings in many municipalities of the United States. The question is one which not infrequently gives rise to difficulty in this country, owing to interference with the surface of roads by companies using their own men. In America the practice is by no means uniform. Indeed, according to Mr. Blanchard, it varies from absolutely no control by any city official to a thoroughly organised administrative supervision. An example of the latter is afforded by one city in which an enactment is in force by which all corporations owning pipes or mains were required to deposit with the city authorities a map showing the exact positions, sizes, and descriptions of all their mains, and, further, to deposit a corrected map at the beginning of each succeeding year. Again, there is considerable diversity of practice in regard to the repair of openings. In some cases the full responsibility for reinstatement is imposed upon the company breaking up the street, while in other districts the filling in and repairing are done by the Commissioner of Public Works. Experience in this country leads to the conclusion that the only really satisfactory method of dealing with the opening of roads by public companies is for them to be reinstated by the local authority. Even so, trouble not infrequently arises from inefficient filling in of trenches and the consequent subsidence of surfaces. The position is much worse, however, if companies themselves are allowed to repair road surfaces, for this practice inevitably results in patchiness and inefficient work generally. The comparison which Mr. Blanchard enables us to make between English and American practice in this matter is both valuable and interesting.

* * *

Pig-keeping.

Apropos of our recent remarks as to the desirability of securing some efficient local control over the construction of pigsties, it is interesting to notice the terms of a regulation which has been made at the instance of the Local Government Board with a view to increasing the national food supply by encouraging the keeping of pigs. The regulation provides that, with a view to maintaining the stock of pigs in the country, any local authority by whom a by-law has been made which is for the time being in force prohibiting, restricting, or regulating the keeping of pigs, may grant permission, either generally or in particular cases, to keep pigs, notwithstanding or contrary to any provisions of any such by-law, *subject, however, to the observance of any directions of the local authority in the interests of public health.* The italics are ours. We feel that at the present moment every effort towards the increase of the food supplies of the country is a matter of cardinal necessity. At the same time, however, it will, we are sure, be generally agreed that there shall be no avoidable risk to the public health. That there would be such risk with the indiscriminate and uncontrolled keeping of pigs goes without saying, and it is therefore very satisfactory to see that the Local Government Board in framing their regulation have definitely empowered local authorities to give such directions as may be necessary in the interests of the public health.

Road Openings.

UNITED STATES PRACTICE AND REGULATIONS.

By ARTHUR H. BLANCHARD, Consulting Highway Engineer, New York.

The present unsatisfactory status of road openings in many municipalities of the United States is due to one or more of the following contributing causes: (1) Lack of centralised administration; (2) inadequate supervision by highway departments; (3) utilisation of inefficient organisations and methods for backfilling trenches, making temporary surface repairs, and final replacement of artificial foundations and pavements.

ADMINISTRATION AND ORGANISATION.

Present practice in administration and organisation governing road openings varies from absolutely no control by a city official to a thoroughly organised administration, such as is found in the cities of Cincinnati and Philadelphia for example. In Cincinnati it is unlawful for any person, firm, corporation, or city department, other than the Street and Sewer Repair Department of the Department of Public Service, to make openings unless a permit is obtained. Philadelphia, with its perfected organisation of experienced engineers and inspectors under the Permit Division of the Bureau of Highways, has an efficient workable plan of control which is worthy of investigation and duplication.

Lack of knowledge of subsurface structures in the majority of municipalities is recognised by municipal authorities. Recently endeavours have been made in several municipalities to remedy this condition. The practice of the borough of Brooklyn, of New York City, Philadelphia, and Houston, Texas, are cited as examples. In Houston all persons, firms or corporations owning pipes, &c., were required to file with the city, within ninety days after the passage of the ordinance, a map on a scale of 200 ft. to 1 in., which showed the exact position, size and description of its mains, laterals, and other subsurface structures; and, furthermore, in each year, within fifteen days after January 1st, a corrected map, or set of maps, must be filed.

In many cities it has become the practice to post notices on highways to be paved or repaved, and to forward such notices to all property-owners residing on streets to be improved, and to persons, corporations, and city departments who control subsurface structures on such streets.

The ordinance of the City of Cincinnati states that no permits will be granted within a period of three years after the construction of roads, except on account of emergencies.

PERMITS AND PAYMENTS FOR RECONSTRUCTION.

Practically all municipalities with over 50,000 inhabitants require some form of permit of a person or corporation desiring to make an opening in a road. In many cases, however, the securing of a permit is a mere formality, as in the case of one municipality of 250,000 inhabitants, whose ordinance only requires for the permit a payment of $2, and notice, in writing, to the Commissioner of Public Works that an opening is to be made. On the other hand, several municipalities require compliance with definite and adequate regulations. As an example, the following excerpts from the ordinances of Pittsburgh are mentioned: The application for a permit must contain a complete detailed description covering position, size of openings, nature of substructures, &c., a bond of $500 for one opening, and $2,000 for an indefinite number of openings must be filed, a deposit to cover the cost of repaving must be made.

The amount of deposit required with a permit varies to a remarkable degree. Some municipalities have adopted a logical basis of charging the cost of repaving plus a certain percentage for inspection and other overhead charges. In the case of the City of Seattle, where all repairs, after the trench is opened, are made by department men under the direction of the Superintendent of Streets, a deposit is required based on the following rates: $2 for each cubic yard of earth filling; $5 for the first square yard of pavement, $3 per square yard for each additional square yard broken up upon the basis of a signed statement by the Superintendent of Streets, the city treasurer pays back unexpended part of deposit, retaining 10 per cent. of actual cost for overhead charges; a utility company may, however, deposit $500 for cost of repairing street openings and renewing same as required.

It should be noted that many cities have adopted a schedule of rates of repaving dependent upon the kind of artificial foundation, the type of road, and the yardage of opening. For example, Schenectady, New York, makes the following charges for artificial foundations and road surfaces: Asphalt, brick, or granite block, $10 for the first square yard and $3 for each yard thereafter; for macadam, $3 for the first yard and $1 for each yard thereafter.

In this connection it has been recommended, in the case of Richmond, Va., that the ultimate cost of installation of lateral connections by public utility companies would be materially reduced if all lateral connections, the usefulness of which could be predicted, were made prior to the time when the street was paved or just before a street was repaved.

BACKFILLING, ARTIFICIAL FOUNDATIONS, AND REPAVING.

Great variation is found in the practice of American municipalities with reference to making repairs of openings by city departments, contractors, or public utility companies. In some cases all repaving work is done by the permittee. In Albany, for example, public service corporations open, backfill, and repave, while in other instances backfilling and repaving is done under the direction of the Commissioner of Public Works. Many municipalities allow the permittee to open and backfill, artificial foundations and road surfaces being constructed by city departments. In a few instances, as in the case of Seattle, the city does all the work with experienced men, the result being that openings are repaired in an efficient manner, and very little trouble results thereafter. It is well to note that the public utility companies of Seattle appreciate having the work done by experienced employees of the municipality, thus relieving them of responsibility in connection with repairs.

Inefficient control and methods of backfilling are the cause of a very large percentage of the troubles arising from road openings. Even with the accumulated knowledge and experience now at hand, many municipalities to-day allow backfilling to be made by the inefficient method of merely shovelling in as much material as the trench will hold. Advanced methods of backfilling are, however, in use in many municipalities where it is required that all material excavated, except rock, shall be placed in the excavation, thoroughly tamped in layers of from 3 in. to 6 in., or flushed if the materials and other conditions are suitable for this method of compaction.

Houston, Texas, goes a step further, and requires that trenches under pavements shall be refilled with well-rammed gravel, broken stone, or brickbats, or refilled with tamped earth and covered with a reinforced concrete (1:2:4) slab, which must project 12 in. on each side of the trench, and have a depth of 10½ in. for a 2-ft. opening, increasing to 15 in. for a 6-ft. opening.

Ottawa requires the construction, in addition to the regular foundation, of a reinforced cement-concrete sub-foundation, 4 in. in thickness, which extends back 4 in. on each side of the trench.

In several municipalities it is required that the cement-concrete foundation shall be cut back for 6 in. on all sides of the opening, and be replaced by new cement-concrete, thus forming a slab to bridge over the trench.

CONCLUSIONS.

Based on observations of practice in many municipalities throughout America and Europe, the following conclusions are submitted as applicable to general conditions found in municipalities throughout the United States:

Administration and Organisation.—Road openings should be absolutely under the control of the chief of the Bureau of Highways; all persons, corporations, and other city departments being required to secure permits from the Highway Department prior to making openings in roads, except

where emergency conditions require such openings to be made in the interests of public health and welfare. Notices should be advertised, posted, and sent to all interested parties, giving ample warning—in cases where streets are to be paved or repaved, and containing the provision that charges to the permittee will cover cost of backfilling, but not artificial foundations and road surfaces. The practice of not allowing road openings to be made within a certain period after a pavement is laid is believed not to be in the interest of public progress, and is unnecessary if the notice advocated is given, and efficient methods of control, backfilling, and repaving are adopted. Plans of subsurface structures on all streets should be compiled, and permits should be granted only after accurate and detailed information has been filed pertaining to all details of substructures in connection with the given road opening. Deposits should be required covering cost of backfilling, reconstructing artificial foundations, and repaving, which should be based on a schedule of rates dependent upon the character of backfilling, type of artificial foundation, kind of road, and yardage of the several items. An adequate percentage should be added to the cost of the above items to cover supervision and other overhead charges. After a permit has been granted excavation should be made by the permittee, and backfilling and repaving done under the supervision of engineers of the highway department and by a flying squadron of experienced men in the employ of the department.

Backfilling and Artificial Foundations.—All material excavated, except rock, should be replaced in the trench, and, in the process of backfilling, the material should be thoroughly compacted by hand or mechanical tampers, or with the aid of water used sparingly, dependent upon the character of soil and kind of pipes. Except in the case of waterbound gravel and broken stone roads, cement-concrete foundations over trenches should be constructed, and such foundations should extend 6 in. beyond each side of the trench, and have a depth of not less than 8 in. If the methods outlined above are adopted, it is not necessary to postpone repaving, provided climatic conditions are satisfactory for such work. If temporary repaving is, for any reason, necessary, it is recommended that the backfilling, as above outlined, be carried to the elevation of the top of the artificial foundation, and that such materials as small stone blocks, paving bricks, laid flat, asphalt block seconds or hot or cold bituminous concrete should be used for a temporary wearing course.

Repaving.—In the process of repaving it is recommended that the old pavement be cut back 3 in. on each side of the new cement-concrete foundation. The adoption of this plan will eliminate planes of weakness, and will ensure the practicability of making an efficient bond with the old pavement.

Footpaths.—The ground beneath footpaths in municipalities should be kept clear of vaults and other accessories of buildings. The space under footpaths should be reserved for the possible future installation of pipe systems, which would relieve present congestion of subsurface structures in the carriageway and reduce the number of openings made in roads.

Remedy for Cellar Flooding.—The cellar under the Essex County High School, at Walthamstow, has given much trouble owing to being constantly flooded. After much expense in trying various means to keep the water away, it was decided to put down a further 2-ft. of concrete, and to use a wall pump periodically. Water still percolated into the cellar, and the county architect then decided to use Pudloed cement concrete. We understand this last-mentioned treatment has resulted in the cellar being made perfectly dry.

Householders and Refuse Destruction.—Following an appeal to the inhabitants to burn their refuse, the amount of material placed in the Leeds dustbins was reduced by 19·8 per cent in a period of several weeks, and the saving in the cost of collection was no less than £16 per day. A test analysis of the refuse collected recently showed that in a working-class district combustible material formed only 25 per cent of the whole, but that in three other districts the percentage was 50. The appeal to householders is therefore to be made again, with the hope that the response will be as good, or better, and more lasting than before.

COST OF TEAM LABOUR.

CRIMSBY FIGURES.

Carting contractors who work for the Grimsby Corporation applied to the Highways Committee last week for an advance of 2d. per hour upon their present rate of 1s. 2d. per hour for team labour.

In a letter from the contractors it was pointed out that oats had risen from 21s. to 54s. per quarter; maize from 18s. to 73s.; and oat straw chaff from 45s. to 90s. per ton.

The chairman of the committee (Alderman T. C. Moss) said that the corporation were at present paying contractors £3 3s. per week of fifty-four hours, yet the cost of a fifty-one hours' week's work by their own employees was £2 17s. 1½d., and he doubted very much if any contractor leading for the corporation paid his men as well as the corporation paid theirs. Yet, after making allowance for the life of a horse at eight years, cost of stabling, shoeing, medicines, and so forth, and paying the men 6½d. per hour, with a 4s. weekly war bonus in addition, the corporation could do the work at some 6s. per week less than the contractors now were paid.

Councillor Thicket asked if capital cost of vehicles and harness and wear and tear of tools were considered in the corporation figures.

The borough surveyor (Mr. H. Gilbert Whyatt) said the contractors used corporation carts and appliances to a great extent.

The chairman: And, anyway, there's a margin of 6s.

Councillor Womersley suggested that the contractors should be asked to furnish a list of wages paid to their men before the matter was considered further, and Councillor Fletcher remarked that the cost of horse food had been quoted, but not the wage rate.

The committee decided that they could not consider the matter on the present details.

MOTOR 'BUSES AND EXTRAORDINARY TRAFFIC.

CONTRIBUTIONS FOR WEAR AND TEAR.

At a meeting of Denbighshire County Council on Friday last Mr. R. B. Adams submitted the results of inquiries he had made as to the effect of motor-omnibus traffic upon the main roads. He called attention to the judgment given in the Court of King's Bench to the effect that motor-omnibus traffic comes within the Extraordinary Traffic Act, and that compensation may be recovered for damage done to roads by such traffic.

Mr. Gomer Roberts suggested that the county council should make an agreement with the motor-'bus proprietors for contributions from them, instead of claiming under the Extraordinary Traffic Act.

Mr. T. J. Matthews pointed out that the main roads in the urban areas were being used for motor-omnibus traffic. He asked whether anything was being paid by the 'bus proprietors in respect of that traffic.

The clerk said that the main roads were under the control of the urban authorities, and the county council contributed towards the cost of their maintenance. The contribution usually made took the form of the full cost.

Mr. W. G. Dodd said he thought there was a good deal in the point made by Mr. Matthews. The county council was being called upon to repair the damage done by motor omnibuses on urban main roads, and if the county council were to make bargains in respect of 'buses which ran into the country the same thing should apply to the traffic in urban areas.

On the motion of Mr. Matthews, the county council decided to request the urban authorities to claim contributions from motor-omnibus proprietors in respect of wear and tear by their vehicles of main roads in such areas.

Assistant Surveyor's Exemption.—Conditional exemption has been granted by the local tribunal to the assistant borough surveyor of a Northern town, passed in B3, who was said to be engaged in the preparation of schemes which it is intended to carry into effect at the conclusion of the war.

Monumental Memorials and Town Planning.*

By Prof. S. D. ADSHEAD.

From the remotest ages it has been the custom of man to memorialise by symbolic representation in ivory, bronze, and stone epoch-marking events. It is to the utilitarian patriots of last century that must be credited the discovery that a memorial could take the form of a hospital or similar useful institution. I have heard of a small Urban Council who, with an eye to thrift and economy, decided to commemorate the Jubilee of Queen Victoria by the construction of a new public sewer. Needless to say, it is not with such memorials that I am concerned.

It is generally recognised that monuments which have been erected in this country during recent years have suffered very much from the lack of a good setting. These things are better understood in France. What is the reason? In Paris, streets and avenues have for the most part been designed. Their angles and junctions are symmetrical, and monuments placed therein take their place quite naturally. There have been times during the growth of London, and to a less degree that of the provincial towns, when streets and squares were laid out similarly. But for the most part our English towns have no composition, and only the cohesion seen in a motley crowd, where every individual is seen pushing his interest in his own way. Under such circumstances monuments cannot be said to fit their sites in an orderly way. They either occupy odd corners or odd junctions of streets, and under our existing system of administration their arrival is as often unexpected as their site is unprepared. So that the general public, or at any rate that section of it who are interested in such matters, are under a constant apprehension as to when and where a monument is to be expected next.

Public Authorities and Art.

Of all public undertakings, the placing of monuments is one that ought certainly to be referred to the general body of town planners, architects and sculptors. We are a democratic nation, and possibly we may soon find ourselves in the position of a very strong democracy. In the matter of the design and placing of public monuments we are entirely in the hands of the public authorities, who have not as yet distinguished themselves in the production or discovery of artistic genius, or else we are at the mercy of some well-meaning though untutored philanthropist who has money to spend. There are places in London and also in our provincial towns where monuments can be part of a civic composition take their place, but in most cases they can never do more than fill a gap. Monuments in towns require prepared architectural sites.

In the best examples of civic design the monument and its surroundings have been considered together. It would, of course, be impracticable, and in most cases quite impossible, to put a new façade to the buildings that surrounded every important monument. But it is almost a platitude to say that they ought to be designed together. As a matter of fact, every building to-day is designed as a frontispiece. Nobody cares to spend money on backgrounds. The result is we get no civic compositions, and never will do, unless our democracy becomes so strong as to recognise that there are chosen moments when the individual must bow to the dictates of an autocracy. It is an open question whether after the war with the democratic spirit that prevails in this country and its impoverished conditions, the national inclination will be in favour of spending huge sums on one or more national monuments, but it is quite certain that monuments costing, say, from £5 to twenty thousand pounds will be erected not only in London but in every provincial town. If these are to be placed to the best advantage it is of the greatest importance that consideration be given to the question of site.

After the death of Queen Victoria practically every town in England erected a statue to memorialise her reign. The best of the vacant sites were then appropriated, though perhaps not always to the best advantage. It was much more difficult to find a site for King Edward.

* From a paper read at a meeting of the Town Planning Institute on Friday last.

The Place de la Concord.

It would require a very lengthy research into history to understand how it is that we have fallen so far short of the success that has been attained as regards similar undertakings in other countries, and especially in France. In the days of the Louis, between the king and his artists there were connoisseurs like Le-Brun, and in the days of ducal influence in this country there was a much broader understanding of the arts on the part of those who controlled their practice, and a much closer intimacy between practitioner and patron than can possibly exist under conditions as they prevail to-day. Let us note, for instance, how Louis XV. laid out the Place de la Concord at Paris

Patte, who has produced a folio on this work, tells us with that punctilious flow of loyal utterance assumed by writers of the day that the towns of France, and especially Paris, desirous of expressing their attachment and loyal devotion to their sovereign, decided to erect statues to his honour. In Paris a great competition was inaugurated, each competitor being asked to suggest a site and its treatment. The competition resulted in the production of some seventy or eighty very ambitious schemes. His Majesty, after having examined them, seeing that it was not possible to put into execution a design without doing away with roads and sacrificing the convenience and interests of numbers of his subjects by the destruction of innumerable houses, and filled with generosity towards his people, made a present to the town of a large piece of land, now the Place de la Concord.

A further competition was held for a monument on this site. It is too long a story to follow the proceedings in detail, but ultimately none of the competitors received the commission of carrying out the design, the work being finally entrusted to Gabriel, the King's own architect, who made such use as he could of the ideas embodied in the competitive designs. There was no doubt much wisdom mixed with what in the light of to-day would be considered unprofessional practice in what was done, but it is a revelation to see the enormous importance that was attached to the preparation of a site for a piece of sculpture.

Trafalgar Square.

Here it may be of interest to note the circumstances that brought into being our own Trafalgar Square.

When Wilkins had completed his National Gallery, he was asked by the Commissioners of Woods and Forests to lay out Trafalgar Square. This was in the year 1837. He died however, when the work had hardly commenced, and the commission fell to Barry in 1840. But previously, on June 2nd, 1838, an advertisement was inserted in the "Times" by a Nelson Memorial Committee for a design for a Nelson Monument to be placed here, a site for the monument having been given by the Commissioners of His Majesty's Woods and Forests. The monument was to be erected out of funds obtained by public subscription. There were no conditions other than those contained in the advertisements, but one hundred and eighteen designs and forty models were submitted. After considerable delay and hesitation resulting from the incompetence of the judges, and their diversity of opinion, there being no professional assessor, and the holding of a second competition, the design of Railton for a Corinthian column was chosen. But there was still uncertainty as to the propriety of imposing so gigantic a column in the Square. A select Committee sat, and the evidence of every architect of distinction was obtained, including that of Barry, the architect of the Square. Barry was amongst those who disapproved of the column, his reason being that it would dwarf its surroundings. Others considered that the column was so important that this would not matter. Before a definite decision was arrived at, however, the businesslike Railton had one thousand pounds worth of concrete put in as a foundation, and there is no doubt, had it not been for Railton's insistence, the misgivings which were general would never have been overcome

RECONSTRUCTION OF WORN-OUT AREAS.

Let me remind you that one of the most important points to be observed in the design of the "public place" is that of preserving an unobstructed spaciousness. Our towns are rapidly increasing in size; they should also increase in scale and dignity.

Many of our provincial towns containing populations of 100,000 and more were but villages at the commencement of last century, yet in the matter of disposition they still retain their village character and practise village habits. We should see that greater dignity is secured, and more orderliness observed. Consider the intrusion of lavatory enclosures, cabmen's shelters, tool sheds, sand boxes, &c., that are everywhere allowed to obstruct and disfigure our public "places," and without any consideration whatever as regards their forming the details of a civic scheme.

We are living in an age of town planning and town improvements, and therefore I would impress upon those in authority in our provincial towns and boroughs the advantage of boldly adopting the policy of the French in the reign of Louis XV., even though as a democratic undertaking it may have to be carried out in a more modest way. I would suggest that, instead of searching the town for an odd corner that perchance may have been overlooked when the last search was made for a site for the Queen Victoria Memorial, a site be provided by the reconstruction of a worn-out area. Let every town of moderate size in England memorialise the part its heroes have taken in the war in the reclamation of a slum, in the erection of an up-to-date group of buildings either commercial, as shops, or domestic—preferably the latter; and in the centre, as a climax to the whole scheme, let it place its war memorial, which incidentally will form a token of the new interest in town life and create a real civic awakening.

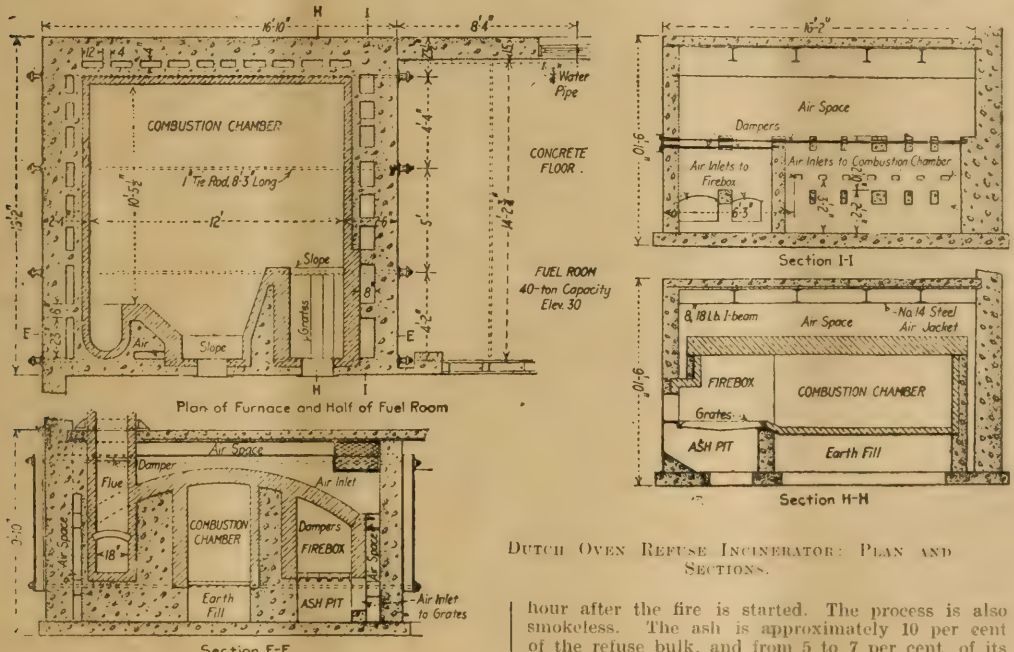
Women Motor Drivers. All the motor cars belonging to Edinburgh Corporation are in charge of the cleansing department, and were till recently driven by men. The men have, however, been called up, and in their place, as an experiment, Mr. Gibson, the superintendent, engaged women drivers. The drivers, it may be stated, are thoroughly acquainted with driving, and have come forward at this time from purely patriotic motives to "do their bit" in a position and sphere in which they are capable. The experiment has been most successful, the lady drivers having proved cautious, attentive, and reliable. Their uniform is a double-breasted blue overcoat, and their headgear a cap with the city arms on the front.

DUTCH-OVEN REFUSE INCINERATOR.

A refuse incinerator, consisting of two 10-ton Dutch-oven-type units, was recently put into use at Mason City, Iowa, and is described in *Engineering News* by Mr. Robert F. Gayton, the assistant city engineer in charge of the work of construction.

Each unit is 12 ft. by 12 ft. in plan and 4½ ft. high inside. The tops of the furnace form the floor of the second storey. The second storey covers but half the building and is the driveway and charging space. The building is 32 by 50 ft. in plan, built of tile, with a pebble-dash outside finish. The roof has a steel frame, and is covered with red asbestos shingles.

The furnaces were built under a patent (U.S. No. 1107615) held by Messrs. Jones Bros., Macon, Georgia. The flues are arranged to give a preheated air supply, so that 60 lb. of the average mine-run bituminous coal is expected to reduce one ton of city-run garbage. This city-run refuse consists of kitchen wastes, commercial wastes—including tin cans and bottles—all carcases, and night soil. The process is odourless at 1,000 deg. Fahr. and higher. The furnaces reach this temperature one-half hour to an hour after the fire is started. The process is also smokeless. The ash is approximately 10 per cent of the refuse bulk, and from 5 to 7 per cent of its weight. The smoke-stack, lined with firebrick, is 18 in. in diameter and 40 ft. high.



Dutch Oven Refuse Incinerator: Plan and Sections.

When the test of the crematory was made, several tons more refuse was consumed than the guarantee called for.

The refuse-collecting wagons discharge directly into the furnace. By the use of the underslung wagon a load is discharged in three minutes. It is rarely necessary to raise the temperature in the furnaces higher than 2,200 deg. Fahr.

The furnaces are in continual operation day and night. Each two weeks it is essential completely to burn out a furnace to clean out the flues, which is a simple matter.

The cost of the incinerator complete was £2,400. As a matter of interest it may be stated that these burning units can be installed singly, in pairs or in any number necessary, in accordance with the quantity of waste material to be consumed.

Hertfordshire War Bonus.—Hertfordshire County Council have decided that the salaries of certain members of the county surveyor's staff and of eight main road district surveyors should be increased by 20 per cent, such increase to be in the nature of a war bonus to commence on January 1, 1917, and to be in operation during the continuance of the war and for a period of six months thereafter.

SCOTTISH NOTES.

[In the hope of making these notes as practically useful as possible the writer invites readers to favour him with communications thereon from time to time. They might be constructively critical, or helpfully supplementary, might indicate new points upon which information is desired, or might merely convey information. Communications will reach the writer if addressed "Scottish Notes," 24 Bride-lane, Fleet-street, E.C.]

Edinburgh Tramways.

In agreeing to take over the undertaking of the Edinburgh and District Tramway Company, the Edinburgh Town Council have for the present settled their "tramway question." It will be unfortunate should public money be spent in the perpetuation of the present system. From what can be gathered from the public Press, the Council seem to have decided that, as soon as [illegible] a clean sweep must be made. It next appears is to take place and new and profitable routes [illegible] must not be delayed longer than the state of war actually demands.

* * * *

Overhead traction seems likely to be adopted for the reconstruction, but there will not be wanting a strong party adverse to its introduction to Princes-street. It surely will not pass the ingenuity of tramway engineers to find a way out in keeping with the artistic associations of the street. The writer remembers the "wordy warfare" that took place in respect of the introduction of overhead equipment in Glasgow, conterminous to the stately mansions of Great Western-road, in George-square, and in the avenues of Pollokshields. Who to-day will be found to object with any serious objection to the overhead wires? Glasgow's system—of which the city is justly proud—is one of the finest and greatest in the world, and Edinburgh will not lose by following in the footsteps of its rival in the west.

* * * *

The Speculative Builder.

At a recent meeting of the Glasgow Property Owners' Association objection was taken to the tendency in recent housing conferences to ignore the speculative builder and to leave him out as a factor in the provision of housing for the working classes. The writer's feeling is there is room for the Trust, Council's Building Committee, the Building Society, and the speculative builder alike. The man who is prepared to give good work is not to be told "come again." Meantime, there is no encouragement to all private building enterprise. Apart from the Government's restrictions, dearness and scarcity of money, coupled with the great increase in the cost of materials and labour, make work impossible. The Glasgow Master Masons' and Bricklayers' Association, at their annual meeting the other day, viewed these matters in a hopeful spirit, and looked for a revival of their activities with the cessation of hostilities, the carrying out of town planning schemes and the many improvement proposals of the city council.

* * * *

Relaxation of Building By-laws and Cost.

In view of the high cost of building materials—which is bound to continue for a considerable time after war is over—what is the ruling likely to be adopted by the authorities in the provision of housing? Are the old methods to be adhered to, are we to continue to build in stone to our heavy rubbles, and provide expensive internal fittings and furnishings? Or are we to endeavour to have our building by-laws and the building conditions of the Burgh Police Acts so revised that construction such as is being adopted in Manchester, Bradford and elsewhere will become possible and general? There are objections to be met in the newer methods. We are told the construction is too light and not suited to Scotland. Have our former methods not been too heavy, and is it not time we began to judge of their suitability to Scotland? An English surveyor of considerable standing has recorded to the writer, "In England we build for a lifetime, in Scotland we build for all eternity."

* * * *

A Scottish general contractor in [illegible] the cause of the difference in cost of house building in England and Scotland. Various reasons were given as militating against favourable results—particularly in Glasgow and the West—the price of land, the costly form of road construction demanded, the methods of building construction, and the tendency to overdo internal adornment. At the same time a plea was put forth for a simpler construction. The matter has not been lost sight of, and Scottish surveyors are particularly alive to the need of reviewing and revising the present methods. The next report of the Scottish Branch of the Institution of Municipal and County Engineers will doubtless be of interest in this respect.

* * * *

1916 Rainfall.

At the risk of anticipating "British Rainfall," a few statistics, which the writer has been able to obtain in regard to the rainfall for 1916, may be of general interest; they at least indicate an abnormal rainfall. At Glendevon and Carnock, where records have been kept for over thirty-three years, no higher rainfall has been recorded, and the last year's figures are some 17 in. over the "mean":—

	Altitude. Feet.	1916. Inches.	1915. Inches.
Glendevon (waterworks) ...	945	77·78	56·74
Carnock (Craiglusear) ...	280	50·27	37·50
Devon Valley (Blairingone)	296	52·58	40·47
Auchterarder (Bellhe) ...	100	41·26	31·43
Dunfermline ...	365	48·79	35·36
Cowdenbeath	473	56·65	43·35
St. Andrews (waterworks) ...	200	38·85	32·68
Arbroath (Muirheads) ...	251	38·06	27·65

CAPE TOWN MUNICIPAL WORK.

NEED FOR COMPREHENSIVE SCHEME OF ROAD RECONSTRUCTION.

In his report, covering the year ended June 30th last, Mr. D. E. Lloyd Davies, M.Inst.C.E., the city engineer, states that, like other important centres, Cape Town is passing through a difficult period in regard to main roads. "The great increase in motor traffic," he says, "calls for a much more modern and expensive type of road than that which sufficed until a few years ago, but no marked improvement can be looked for until a comprehensive scheme of reconstruction is undertaken."

Concrete proposals had been laid before the council, but, unfortunately, funds have not been found to finance the scheme so far. "It is patent," observes Mr. Lloyd Davies, "that much money will be wasted in continual repairs, and that considerable inconvenience will be experienced until definite action is taken."

The condition of the secondary roads, as a whole, is improving. Notwithstanding the very high prices of materials and ever-increasing mileage, the expenditure on road maintenance has been kept within the comparatively restricted amounts voted.

TOWN PLANNING.

The city engineer mentions that a comprehensive report on town planning was presented to and adopted by the council, and regulations to enable the development of new estates to be properly controlled have now been framed. Measures are being taken to obtain further powers that will be required before a town planning scheme for the whole area can be undertaken.

STREET WATERING.

During nearly the whole of the summer there was a great scarcity of fresh water, and salt water was therefore used most exclusively for street watering.

All important and busy thoroughfares were watered at least twice daily, and those subjected to the heaviest traffic were watered three and four times daily, when necessary.

SANITARY SERVICES.

At the beginning of the year this branch of the work was thoroughly overhauled, and an improved method of working was introduced. The practice of effecting removals in the day-time was discontinued and a better supply of pails provided. The satisfactory results attained may be gauged by the fact that the number of complaints, which in the first three months amounted to 194, sank to nine in the last three months.

Recent Practice in the Purification and Softening of Public Water Supplies.*

By FRED. C. UREN, M.INST.C.E.I., Surveyor to the Aldershot Urban District Council.

(Conclusion.)

Closely allied and frequently auxiliary to filtration proper are the processes for the destruction of algæ and pathogenic bacteria, and in recent years many experiments have been made with various methods of sterilisation in order to satisfy the demand for a bacteriologically pure drinking water. The three methods which have been adopted are: (1) Chemical sterilisation; (2) ozone; (3) chlorine.

In the first method either chloride of lime or chloride of potash is used in sufficient quantity to destroy bacteria.

Ozone.—The application of ozone to the sterilisation of partly purified water supplies has been largely exploited on the Continent.

There are many devices for ozonising air, which commences when the tension reaches about 10,000 volts, most of them being adaptations of the Siemens ozoniser, familiar to all students of physics—*e.g.*, the De Frise apparatus, the Otto process, the Siemens-Halske, the Vosmaer, and the Howard-Bridge. The sterilising tower is generally about 25 ft. high by 3 ft. diameter, and is enamelled on the inner surface to avoid corrosion. At various points in the steriliser a series of celluloid sieves with perforations $\frac{1}{40}$th of an inch diameter are fixed so that the water passing through the cylinder is split up into a number of fine jets. The ozone is added with the water at the foot of the tower, and passes upwards to the draw-off pipe, which is placed at the top end of the cylinder. The energy absorbed per 1,000,000 gallons in the ozoniser averages about 60 kw.-hours, and a further 75 kw.-hours are required by the auxiliary machinery.

It has been installed in about thirty French towns, in Roumania, at Petrograd, in Holland, Belgium, Germany, Italy, Spain, Brazil, Egypt, and experiments have been undertaken at Darjeeling, in India, while an installation is in course of construction at the Knutsford waterworks, Cheshire.

The largest plant is that at Petrograd for dealing with 11,000,000 gallons per day. Here the water is first treated with sulphate of alumina, whence it passes on to thirty-eight sand filters at a rate of 1,000 gallons per square metre of filtering surface per hour, and finally enters the five sterilising towers along with ozonised air. There are 128 Siemens-Halske water-cooled ozonisers. The air is deprived of its moisture by refrigeration, and is ozonised to the degree of 2·5 grains per cubic metre.

In July, 1910, the Paris Municipality decided that the part of the city drinking supply derived from the Marne (about 20,000,000 gallons per day) should, after coarse filtration, be sterilised by ozone, half by the De Frise and half by the combined Otto process. The latter employs "emulsers," which are injectors effecting a mixture of ozonised air with the water, the action being completed in "columns of self-contact."

As to the cost of purification by ozone at Petrograd, in 1911 it was recorded as 0·86d. to 0·97d. per 1,000 gallons.

At St. Maur, Paris, Monsieur Colmet Daage estimated that the cost under most favourable conditions was 0·31d. per 1,000 gallons, excluding interest, amortisation and repairs. At Nice, where cheap water power is available, the average in 1911 was given as 0·164d. per 1,000 gallons; and at Rimiez, where there is besides no pumping, it was only 0·125d. At Ginnekin, Holland, the cost was 0·45d. per 1,000 gallons. Costly as this process of purification may be, it is probably one which is well worth the sacrifice of a little money, when it furnishes unexceptional drinking water from a source like the river Mark, whose waters have been justly described as execrable from a hygienic point of view. The capital cost for purifying 1,000,000 gallons per day would be about £3,000.

Different waters, of course, make different demands on the purifying agent, and it is recommended by the leading authorities that tests be made to determine the minimum quantity of ozone that can be with safety applied.

Chlorine Sterilisation is effected in practice by means of hypochlorites, prepared either chemically or electrolytically.

Chemical chlorine, a gas evolved from chloride of lime (the weight available in the latter being about 28 to 33 per cent), is largely used in America and at some places in Europe and India. It was employed to stop the typhoid epidemics at Lincoln, Maidstone and Cambridge. At Johannesburg, the Witwatersrand supply is sterilised by the addition of chloride of lime equivalent to 0·25 to 0·5 per 1,000,000 of available chlorine. The cost of treatment is approximately 2s. per 1,000,000 gallons of water sterilised.

The electrolytic (sodium hypochlorite) formed by the electrolysis of common salt overcomes some of the objections to the lime compound. It leaves behind only an unimportant residue of common salt, and has a slightly greater bactericidal effect.

Liquid chlorine is of quite recent date, and has not yet reached this country; it is used in the States, and has met with considerable success there, though not quite so easy to apply. Several plants have been designed which allow the chlorine to gasify into the water under proper control, and the bacterial results obtained are very good. It has the advantage over hypochlorites in not adding any salts to the water.

Ultra-Violet Rays.—The application of artificial light to the purification of water is an enterprise of recent growth and considerable scientific interest. These rays correspond to the X-rays, and have, in common with all light, their origin from the sun. Mixed with suitable elements they may be produced artificially, and our allies, the French, who have persevered largely in this direction, have invented an apparatus consisting of a mercury vapour-lamp and transparent quartz, in which electrical energy is transformed into ultra-violet rays.

The lamp is placed inside a closed cylinder, to which water is admitted and circulated under pressure from the mains, and subjected to the action of the rays produced under an electric current of 220 volts, and 120 watts are required for the purification of 1,000 gallons. The actual effect is really a question of penetration, for it has been found that colloidal matters practically nullify the action of the rays so that prefiltration is desirable.

A Westinghouse-Cooper-Hewitt apparatus at Marseilles deals with 158,000 gallons per day. There is no appreciable alteration in appearance, odour, or taste in the treated water. The capital cost of a suitable plant would be about £2,900 per million gallons per day, while the working costs would be 0·48d. per 1,000 gallons exclusive of interest and sinking fund.

WATER SOFTENING.

The ordinary methods by which water has hitherto been softened and purified are now well known and understood, and have been described and discussed in detail in many excellent publications dealing with existing systems. Although these older methods, the Clarke, Atkins, Haines, Harris-Anderson, Lassen and Hjort, and many others exhibit wide differences of efficiency as regards the actual mechanism by which the water-softening operation is carried out, they all achieve their effect by identical means—viz., the precipitation by the addition of lime and soda, in proper proportions of the hardening salts in the water, and the subsequent removal by sedimentation or filtration of the resultant sludge so formed.

The precipitation process, properly carried out, undoubtedly achieves exceedingly efficient results, and a large number of such plants are working in the United Kingdom and abroad with marked success, and for many years the process was the only known and tried method by which the softening of water could be effected.

There is now in general use another process which renders possible the achievement of results never previously attained in water softening. This is the

* From a paper read at a meeting of the Institution of Civil Engineers of Ireland on the 5th inst. at Dublin.

"Permutit" regenerative process which operates on a principle quite different from that of all existing systems.

The Permutit Process.—This process is probably the most advanced step in water softening of recent years. Permutit is a term given to the flaky metallo-aluminate-like artificial zeolitic minerals manufactured under the Gans patent, and employed in Permutit filters for softening waters to distinguish them from the natural zeolites or silicates containing water.

By the power of "base exchange," which Permutit possesses, both the calcium and magnesium carbonates are abstracted from the water directly it comes into contact with Permutit, thus leaving in the softened water equivalent sodium salts. This softening exchange action continues until each grain of the Permutit has parted with all its sodium, when it may be said to have become exhausted, and regeneration is required. This to-and-fro process of softening and regeneration is regular and automatic without wastage. Common salt is employed for regenerating the sodium Permutit, the quantity depending upon the hardness of the water plant operating for softening during the day and regenerating at night. A modern plant thus works without interruption day and night. (See Fig. 5.)

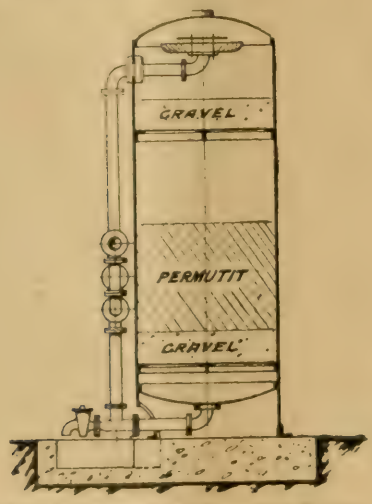


Fig. 5.—Section of Permutit Filter.

The simple method of mixing water softened to zero with untreated water in order to produce a [illegible] of a specified hardness has been adopted for some years past with unqualified success in the case of the Permutit installation laid down by the West Cheshire Water Company, who supply [illegible] water to eight townships.

The present cost is 1·90d. per 1,000 gallons, to which there is to be added from about 18 deg. Prior to the year [illegible] 729 tons salt, [illegible] interest on capital outlay.

In waters which have been drawn in shallow wells or springs from marshy districts more frequently contaminated with organic substances, is present in such conditions as to render its separation by the hitherto accepted means of aeration extremely difficult. By means however of the Permutit system that difficulty has been overcome, since by a process of exchange analogous to that previously described, the iron can be eliminated by simple filtration through Permutit, which has been treated with a manganese salt and thus converted into manganese Permutit. Incidentally the treatment has another valuable effect in that any organic matter or bacteria will, through contact with the manganese Permutit, be entirely destroyed. A system of sterilisation of water by [illegible] which on close investigation by leading authorities on hygiene has been entirely approved.

The cost per 1,000 gallons for this iron removing Permutit system works out at a figure below it is claimed ANYTHING which can be worked in a surface aerating plant, and in addition, affords the following advantages, viz.:—The separation of the iron is complete, all organic matter removed. Working expenses in connection with the removal of sludge and otherwise which are attendant upon surface aeration plants are entirely eliminated. Permutit removal of iron is carried out by means of a plant in which there are no movable parts, and the operation of which is of great simplicity.

Conclusions.

The slow sand filter, when judiciously managed, is a sufficient safeguard against the distribution of polluted water, and such was the view of Dr. Koch when he formulated his conclusions on the immunity of Altona from cholera in 1892.

It intercepts 98 per cent of bacteria, diminishes organic matter, and yields an effluent free from suspended matter. It is well known that at some seasons of the year only a small percentage of the colour is removed, and it fails to make innocuous waters containing peaty acids. The principal screen for arresting germs and suspended matter is the surface film, which requires three or four days to ripen by the accumulation of algæ and zoogloea.

The capital cost of installing sand filters varies from £8,000 to £10,000 per 1,000,000 gallons, according to the locality. The cost of maintenance and treatment varies from 4s. 2d. to 6s. per 1,000,000 gallons. The latter is furnished by the late W. B. Bryan, chief engineer to the Metropolitan Water Board.

Multiple Filtration.—As previously stated, except in rare instances, sand filter plants dealing with river water are supplied with decanting basins or settling tanks. In such a plant the usual practice has been to provide a filtering surface which will yield a filtrate not exceeding 4 in. vertical fall per hour. In the case of a multiple filtration plant, for an entirely new scheme, the basis could be safely taken at a speed of 6 in. per hour. Assuming that the multiple filters (pre-filters) are to be efficient, the sand filters should run for very long periods without cleaning, and with care it should be possible to arrange for cleaning at times when the demand was below the maximum.

Having fixed upon this figure, the area of the pre-filters has to be considered, and for very turbid waters, such as are met with in the Colonies, an average figure may be:—

Degrossissers	. .	12,250 sq. ft.
Pre-filters	...	33,500 ,,
Final filters	... ...	140,000 ,,

The effective agent of purification is spread through a considerable depth of the mass of the sand, instead of being limited to a thin film. The efficiency is thereby greatly increased. It is possible to start the filters immediately after scraping at the maximum speed without running the water to waste.

Pathogenic organisms which thrive upon organic matters in suspension and solution disappear because the water has been deprived of the bacteria which supports them, and the efficiency consequently reaches a higher degree of purification, an undoubted advantage, too, is the regularity and uniformity of the bacteriological results.

For air cleaning the gravel beds a Roots blower or similar apparatus driven by an oil engine is used, while a travelling scraper is employed for cleaning the pre-filters.

In this way an installation capable of dealing with several million gallons per day can be controlled by one man, except on the rare occasions when it becomes necessary to scrape the final filters.

Peaty acids are economically neutralised by using limestone in the roughers, as at Derwent Valley. Colour can be removed by filtration, unless it is the result of peat or other stain. In such cases permanganate of potash has been found to be both cheaper and more easily applied than sulphate of alumina, which is always wasteful in application. In any case, the application of a chemical in multiple filtration is a simple matter, owing to the number of basins comprising the plant and the frequent mixing of the effluent after each stage.

For the removal of sedimentary matters it is generally conceded that triple filtration gives better results and is more economical than subsidence basins and ordinary sand filters; and it is probably safe to say that, as its efficiency is realised in the treatment of waters subject to considerable variations in the number of bacteria, the silt in suspension, and the salt in solution, it will be more extensively adopted.

Its introduction into Paris when the authorities wished to supplement the water supply of the outer parts of the city with water from the Seine was the result of investigations carried out by their officials throughout Europe, America, and the Colonies, and

the conclusion arrived at was that by adopting the principle of pre-filtration a more economical plan with uniform results was assured.

In the case of Magdeburg the authorities had in the river Elbe an unlimited quantity of water, but contaminated to a considerable extent with salts, and somewhat badly with sewage and the refuse from factories. In order to avoid the alternative of the vast capital expenditure involved in the construction of reservoirs in very unsuitable country, they had adopted the system of multiple filtration.

Mechanical Filtration. The advantages of this process over slow sand filtration are—less capital cost, variously estimated at one-third to one-half that of the latter; economy of space; ease of management and cleansing. By the application of a coagulant, colouring matter in solution is removed; plumbo-solvent tendencies due to the presence of peaty acids are neutralised. Various observers give the cost per 1,000,000 gallons of water treated by mechanical filters as 9s. 8d. Mr. F. J. Dixon, M.I.C.E., engineer to the Ashton-under-Lyne, Stalybridge, and Dukinfield Waterworks, gives the following particulars for 1913 and 1914, relating to the cost of treating the water there per million gallons by mechanical filters:—

1913.—8s. 9d., including chemicals, carting, labour, and sundries.

1914.—6s. 11d., including chemicals, carting, labour, and sundries.

The quantity dealt with in 1913 was 1,666,962,000 gallons, and in 1914, 1,138,187,000. The percentage of washwater used was 0·908 and 0·907 respectively; the average rate of filtration 63·5 per sq. ft. per hour, and 57·9. At Newport, Monmouth, the cost is given as 11s. 7d., and at Harrogate 3s. 3½d.; the latter, removing peaty discolouration and iron, does not comprise the use of chemicals. One very important further advantage of mechanical filters is their adaptability. They can be employed as pre-filters with practically no attendant running expenses. They may be used for the removal of iron alone as in the case of deep well waters at a current rate not exceeding 1s. per million gallons treated, as at Tunbridge Wells, Cardiff, West Cheshire, Biggleswade, &c., against a charge of 10s. 6d. in the first case and 5s. in the second, when previously treated in open sand filters.

In conjunction with suitable reagents, that can be quite conveniently applied, mechanical filters may be equally adapted to the work of softening and sterilisation.

Sterilisation.—There is a tendency among engineers and bacteriologists toward sterilising supplies, and to the establishment of safeguards against the survival of a single pathogenic germ, but whether it is possible for this policy of protection to be carried to unnecessary extremes which might not ultimately be beneficial remains to be seen.

The advantages of this process are that it makes it possible to utilise much more freely than hitherto the supplies obtainable from rivers which adjoin a town—which are in fact at its door—thus saving an immense outlay in engineering works and landowners' profits, easements, &c.

In waters not oxidisable by the ordinary process, as, for example, the water of the Seine, the engineer is possibly justified in resorting to chemicals, and it seems incumbent on the profession to study carefully the progress which has been made abroad and in the States with the improved methods of sterilisation based upon the technical application of increased knowledge in the modern sciences of electricity and bacteriology.

Everything depends upon local circumstances; with reasonable care sand filtration is ordinarily a sufficient safeguard against the distribution of filtered water. Again, the economy of working and efficiency of slow sand filters can be greatly enhanced by preliminary treatment in mechanical roughing filters, as at Weardale, York, Reading, West Hampshire, &c., for the removal of the grosser impurities.

On the other hand, where initial expense is a consideration, where space is limited, and sand scanty, pressure filters have advantages. Triple filtration has been purposely dealt with at some length because many leading authorities (Dr. Kemna, of Antwerp, among the number) state that "It is rather by the improvement of existing methods than by the introduction of new processes that the science of water purification should be advanced, and by which a reduction of the death-rate may be secured." The most important question is, of course, that of safety. Drinking water, says Dr. Rideal, has got to be wholesome, not sterile; what we have to do is (1) To prevent the entrance of disease organisms; (2) To kill them if they do enter. In both objects the engineer and the chemist must collaborate, and the bacteriologist must keep watch.

"STUDS" FOR LOCOMOTIVES.

NEW LOCAL GOVERNMENT BOARD ORDER FOR TRAFFIC ON FROST-BOUND ROADS.

The following circular and Order, dated February 6th, has been addressed by the Local Government Board to the clerks of county councils and other local authorities:—

I am directed by the President of the Local Government Board to state that his attention has been drawn to the restrictive effect of the requirements of sub-section (4) of section 28 of the Highways and Locomotives (Amendment) Act, 1878, upon the movement of agricultural locomotives during the present severe weather, when the roads being frost-bound are slippery.

In view of the representations which have been made to him as to the importance of securing that agricultural operations should, as far as possible, be facilitated during the present national crisis, Lord Rhondda has decided, as a temporary war measure, to issue an Order varying the statutory requirements in question so as to enable the driving wheels of an agricultural locomotive, whilst it is being used on a frost-bound road, to be provided with studs. In any other condition of the road the statutory provisions will apply.

THE ORDER.

Whereas by section 28 of the Highways and Locomotives (Amendment) Act, 1878, it is enacted that it shall not be lawful to use on any highway a locomotive constructed otherwise than in accordance with the provisions therein set forth, including sub-section (4) thereof, which relates to the driving wheels of a locomotive:—

Now, therefore, in pursuance of the powers given to us by section 9 of the Locomotives on Highways Act, 1896, we do hereby order as follows:—

Article I.—In this Order the expression "agricultural locomotive" has the meaning assigned to it by section 17 of the Locomotives Act, 1898.

Article II.—Notwithstanding anything in sub-section (4) of section 28 of the Highways and Locomotives (Amendment) Act, 1878, the driving wheels of an agricultural locomotive which are shod with diagonal cross-bars may, while the locomotive is being used on a frost-bound road, be provided with studs constructed and attached as follows:—

1.—The studs shall be fixed securely in the diagonal cross-bars of the driving wheels of the locomotive at regular intervals and not more than 9 in. apart.

2.—The studs shall be not less than 1 in. nor more than 2 in. in diameter, and shall have a well-rounded and approximately semi-circular head.

3.—The studs shall not project more than 1½ in. from the diagonal cross-bars of the wheels.

Article III.—This Order may be cited as "The Locomotives on Highways (Agricultural Locomotives) Regulations, 1917," and shall have effect during the continuance of the present war.

L.C.C. Tramcars for Sheffield.—The London County Council are selling ten tramway cars to the Sheffield Corporation, who have been unable to get from the Ministry of Munitions a permit to purchase twenty-five new cars.

Rosyth Housing Contract.—The contract for the housing of the workers at Rosyth has been entrusted to Messrs. Holloway Brothers, London. It is understood that from 700 to 1,000 houses are to be erected during the present year.

Institution of Civil Engineers.—At a meeting of the Institution to be held on Tuesday next further discussion will take place on the paper on the main drainage system of London, which Mr. G. W. Humphreys, the chief engineer to the London County Council, read on Tuesday of last week. An abstract of the paper will be found in our issue of the 9th inst.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Did not Mr. Humphreys' paper on the main drainage system of London show us what gigantic works of sewerage were necessary and have been carried out by the Metropolitan Board of Works and their successors the London County Council? Do not these works, so skilfully designed and so well executed, redound to the credit of the engineering staffs of these bodies, and does it not show how man's ingenuity and labour can counteract the dangers inherent upon the crowding together of large populations upon small areas, a tendency which is one of comparatively modern growth? When we reflect on the sanitary condition of London only seventy years ago and what it is now, are we not afforded an idea of the vast amount of sanitary works which has been carried out in this comparatively short period?

* * * *

Do not the "Notes from Ireland" in last week's issue of THE SURVEYOR show a very lamentable want of sanitation in some of the rural districts of that country? Does it not point to the need of appointing medical officers of health for each county in order to grapple with a condition of things which ought no longer to exist in this the twentieth century? What will be the result some day if an epidemic "happens" to break out?

* * * *

Is it not rather an indication that pedestrians are becoming more careful in the darkened streets when we read in a report by the Commissioner of the City of London Police that, whereas in the last quarter of 1916 there were 258 street accidents arising from vehicular traffic, of which five were fatal, in the corresponding quarter of 1915 there were 350, of which seven were fatal?

* * * *

When we see in a recent advertisement for an important municipal appointment that the officer must not give professional evidence in any legal proceedings, or before a Parliamentary Committee, without first obtaining the consent of the Health Committee, and that all fees received by him, for any purpose whatever, must be paid into the public funds, is not one reminded of ancient Rome, where the nobles compelled their slaves to write poetry, the proceeds of the sale thereof being pouched by the owner of the slave?

* * * *

Is the addition of salt for the purpose of melting snow the right principle to adopt? Does it not cause great trouble with the electric current on conduit tramway systems? Does it not seriously affect horses' hoofs and fetlocks, and does it not form a freezing mixture which affects poorly shod pedestrians?

* * * *

Is it not a great compliment to Mr. Brodie, the eminent city engineer of Liverpool, and to English road engineers generally, that the *Canadian Engineer*, in its issue of January 4th last, made the suggestion "that it would be of distinct interest to highway engineers and road contractors in Canada if the Canadian and Industrial Good Roads Congress, which is to meet this year at Winnipeg, could induce Mr. Brodie to attend the convention and deliver an address on the subject of his bituminous sand-grout pavements laid in Liverpool"?

* * * *

What is meant by "best hand-picked and broken granite and grouce"? which appears in an advertisement issued on behalf of the town council of Banbury asking for tenders for the supply of the above materials. What is "grouce"? And does this term appear in Mr. Brodie's "Glossary of Road Terms"? Also, for the matter of that, what is meant by "hand-picked and broken granite"?

* * * *

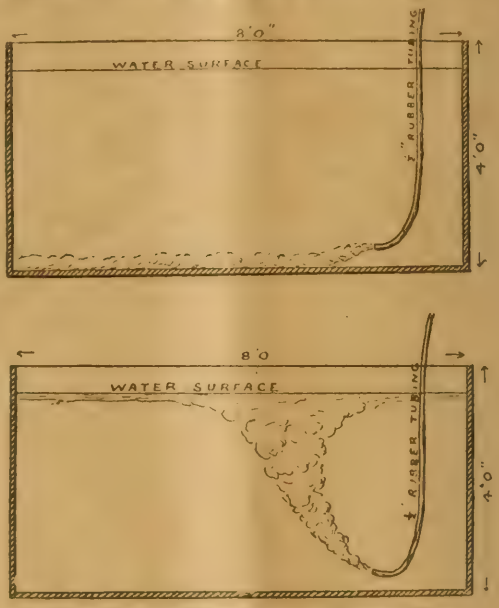
Would it not rather a novel suggestion, recently made in America, in order to prevent excessive speeds of motor cars, that each car should be fitted with a Government seal or receptacle in which should be placed cards bearing the name of the owner of the car and his photograph and address, and that by an ingenious mechanical arrangement one of these cards should be liberated and fall on the road if a certain speed were exceeded, and thus lead to the prosecution of the owner? What next?

DIFFUSION OF SEWAGE IN WATER.

[In a paper before the Connecticut Society of Civil Engineers, in which he discussed the pollution of New York Harbour and the remedies proposed, Mr. Kenneth Allen, engineer of sewage disposal of the Board of Estimate and Apportionment, described some interesting and instructive experiments dealing with the diffusion of sewage in water. We reproduce this part of his paper from the "Municipal Journal" of New York.]

Experiments were made to observe the diffusion of sewage in harbour water, first with thirty-one experiments on a small scale in the laboratory, then with twelve in a tank about 8 ft. long and 4 ft. deep in the New York Aquarium, and finally with thirty in the harbour itself.

Either tap water or sewage coloured with uranine or some other dye was injected at different depths and in different volumes into water of different degrees of salinity. As observed in the laboratory by dropping from a pipette or a fine drawn glass nozzle, some of the forms assumed were very beautiful. The form was usually an inverted cone, but circles resembling smoke rings, vertical columns of cumulus appearance, similar to the dense smoke rising from



JET OF SEWAGE ISSUING IN FRESH WATER (UPPER SKETCH) AND IN BRACKISH WATER (LOWER SKETCH).

a burning oil tank on a still day, were noted. The form depended, of course, on the velocity of the jet and the relative density of the two liquids.

To show the relative rapidity of diffusion in waters of different degrees of salinity 30 c.c. of sewage coloured with 1/10000 part of uranine was discharged gently from a pipette on the surface of 3,000 c.c. of the water in a Mason jar. When the jar held tap water only, diffusion began in a few minutes and was complete in an hour; when it contained 25 per cent of sea water diffusion was not complete until forty-eight hours, with 50 per cent sea water not until fifty-six hours, and with 75 per cent sea water and 25 per cent tap water diffusion remained incomplete at the end of a week. The experiment brought out the great advantage, so far as diffusion is concerned, in a discharge of sewage into fresh water.

One of the most interesting of the aquarium experiments consisted in the discharge of coloured sewage into tap water from a ¼-in. jet under a head of 0·15 ft. in a horizontal direction at a depth of 3·4 ft.—that is, at the bottom of the tank. The sewage first spread out in the form of a blanket about 2 in. thick over the bottom of the tank and then, after about three minutes, began gradually to diffuse. Within about a half-hour, diffusion was complete throughout the tank. When, however, the discharge was into salt or brackish water, the sewage rose in a cone to the surface, where it spread out in a thin

layer and then diffused. This illustrated clearly the tendency of sewage to remain near the bottom if discharged horizontally into fresh water until diffusion takes place.

OUTDOOR EXPERIMENTS.

In the thirty outdoor experiments the coloured liquid was pumped to different depths at different points in the harbour and the appearance of the dye on the surface noted. When three and one-third pounds of uranine was dissolved and dumped in the harbour water it could usually be readily detected after flowing one and one-quarter miles in a current of two and one-half miles per hour. Two and one-half pounds could likewise be detected at this distance if the current were 1·6 miles per hour. If conditions of light were good, and unless greatly diffused, the field of colour was readily visible from the deck of a launch at a distance of 2,000 ft.

Most of these experiments were made by pumping a dilution of one-part uranine in about 2,000 of tap water or sewage from large casks, holding in all about 1,000 gallons, through a 1¼ in. hose to different depths with a velocity of 6½ ft. per second and noting the result at the surface.

At the proposed location of the Passaic Valley sewer outlet near Robbins Reef when the specific gravity of the harbour water was 1·020, a 1:500 solution of uranine pumped to a depth of 40 ft. was discovered at the surface.

On another occasion 16,500 gallons, having a dilution of 1:2750, was pumped through a 2½ in. hose to a depth of 40 ft. with a velocity of 14 ft. per second. The specific gravity of the harbour water at this time was 1·0125. No sign of the dye was, however, noted at the surface.

In a yet larger test 56,000 gallons of tap water, containing 290 lb. of uranine were pumped from a pontoon through an 8-inch pipe to a depth of 40 ft. at a rate of 2,320 gallons per minute. The velocity of the current at a depth of 3 ft. was 0·45 ft. per second; at a depth of 20 ft., 1·03 ft. per second, and at a depth of 50 ft., 2·85 ft. per second. At the point of discharge, 40 ft. below the surface, it was estimated at 2·2 ft. per second. The specific gravity of the harbour water ranged from 1·015 at the surface to 1·018 at a depth of 50 ft., and the temperature was 72 deg. F. In spite of the large volume discharged this was not detected on the surface.

CONCLUSIONS.

Several important conclusions are drawn from these seventy-nine experiments relative to the discharge of sewage into bodies of water.

In the first place, the effluent will rise in still water towards the surface or fall, depending solely on the relative specific gravity of the two liquids. In sea or harbour water it will rise, while in upland water of considerable purity it will remain at the level of discharge or fall toward the bottom.

Immediately after its discharge sewage begins to diffuse and commingle with the surrounding water. This diffusion will take place more rapidly the less the salinity, and probably bears some relation to the volume, or exposed surface, of the effluent; but at this stage diffusion is of less importance than the mixing action or dispersion. The latter depends largely on the relative velocity of the sewage effluent and the stream into which it is discharged. If the current is rapid or with turbulent eddies the mixing will be rapid and may obliterate any buoyant effect due to the original specific gravity of the sewage. In equal mixtures of sea and upland water, however, sewage will rise, and may be expected to reach the surface so as to be detected from depths up to 30 ft. From depths of from 30 ft. to 40 ft. it is uncertain whether it will make its appearance. Much depends upon sub-surface currents. But at depths greater than 40 ft. it is not likely to be seen at the surface unless discharged in very large volumes.

In still water of from ·004 to ·016 greater specific gravity, sewage will rise at the rate of from 0·10 to 0·17 ft. per second.

THE PURIFICATION OF WATER IN WAR TIME.

The wisdom of all the ages, concentrated in this question of purifying water for use in a military campaign, has now (says Captain J. C. McWalter, M.D., LL.D., D.P.H., R.A.M.C., Mediterranean Expeditionary Force, writing in the *Journal of State Medicine* for February) reduced itself to adding a few grains of common chloride of lime to each 100 gallons—to be meticulously exact, 30 grains to 100 gallons of water. This minute proportion effectively kills off organisms of the coli group and renders the water perfectly potable—that is, if it were a fairly sound water before the chlorinating process.

It must be admitted that the chlorination process is distinctly satisfactory. It is simple, it is cheap, it is safe and effectual. Like all earthly things, it has its drawbacks, but many of these are imaginary. The crude honesty which prevails of calling this purified water (wherein there is scarcely one part of chlorine in 1,000,000) "chlorinated water" has rather played on the nerves of the sensitive Tommy and still more of the susceptible officer. If an Army order went forth deciding that it should be called "purified" rather than "chlorinated," very much of the prejudice against it would vanish. If just a little care were taken that neither too much nor too little of the chloride of lime were added, then another source of complaint would disappear.

The chloride of lime is a constant source of trouble. It is supposed to contain about 33 per cent of available chlorine when fresh, and most calculations are made on the basis that it contains 30 per cent, but in tropical countries, far away from home, where the supply is probably from six to nine months old, it was found that the proportion varied from 8 to 24 per cent. It is now usually sent out in well-corked glass bottles, but when a bottle has been opened several times its strength rapidly diminishes, and even with an absolutely new bottle it will be found that the top is far weaker than the centre portion.

When chlorinated water lies in a tank for a few days, I have found the percentage of free chlorine diminish by about 25 per cent, and the bacteriological test shows a more unfavourable result. This is apparently due to the formation of hydrochloric acid in minute amounts, as well as to the natural evaporation of the chlorine. If therefore a tank has to lie for many days before being consumed, it may be necessary to test its strength again and to rechlorinate it.

When used for cooking purposes it is well to boil the chlorinated water for a couple of minutes, so as to drive off as much as possible of the chlorine.

Urban Authorities and Pig-keeping.—Halifax Corporation have announced that they are willing to waive the local by-laws, so far as they prohibit the keeping of pigs within 100 ft. from any dwelling, in cases where it is not likely to be detrimental to public health or cause a nuisance. Ossett Town Council have decided on similar steps.

Law Notes.

Edited by J. B. REIGNIER CONDER, Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries which should be written legibly on foolscap paper, on one side only) should be addressed to "The Law Editor," at the Office of The Surveyor, accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary, copies of local Acts or documents referred to should be enclosed. **All explanatory diagrams must be drawn and lettered in black ink only, and in such style as to be fit for direct reproduction** i.e., **without re-drawing or amendment.** *Unless these conditions are complied with we cannot undertake to reply to queries.*

Highway Fallen Tree—Damage to Passenger Locomotive.—In *Hudson and Another* v. *Berry* (King's Bench Division, December 12th), the defendant appealed from the decision of the judge of the Bishop's Stortford County Court. The facts were as follows. On the night of December 27th a tree growing on the defendant's land was blown down, and fell across the highway, at a point where the road passed through a cutting, with its top resting on the opposite bank, some 5ft. high, and its roots on the bank on the side on which it grew, some 3 or 4 feet. At the time they viewed the road foreman of the Herts County Council and two of the defendant's men were engaged in trying to remove it, but without success. They ceased work when it became dark, and went off to fetch a light, and about a quarter of an hour later the plaintiffs drove along the road in a motor-car, and ran into the tree, damaging the car and receiving personal injuries. The county-court judge held that the defendant had been guilty of negligence in failing to light or guard the tree and gave judgment for the plaintiffs. The appeal was allowed on the ground that there was no evidence of negligence. In the course of his judgment Mr. Justice Bailhache said that in *Gadsby* v. *Smith* (12 Q.B.D. 121) it was held that an omission to remove an obstruction may be wilful obstruction of a highway under the Highway Act, 1835. The present action, however, was not for failing to remove the tree, but for failing to light and guard it. He thought there was no duty on the defendant to set a person to watch it to light the tree, and, at any rate, the accident happened while a light was being fetched. Mr. Justice Avory said that there was no culpability under the Highway Act, 1835 (either under section 65 or section 72), to light or guard the tree, although the defendant might have been guilty of wilful obstruction if he had failed to remove it after notice from the highway surveyor.

QUERIES AND REPLIES.

In order to avoid confusion queriists are requested to use distinctive words as noms de plume. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

Subscribing Banks and Trees Across Highways in Rural Districts.—"S. Y." writes: I shall be glad if you will give me your opinion on the following:—(1) Who is liable to keep away the earth of fields adjoining the highway which subsides into narrow lanes? I may say the roads are in like cuttings, with banks 9 ft. to 10 ft. high on each side, and there are signs of large quantities of earth subsiding into and blocking up the road. (2) When trees fall down across the highway, whose duty is it to remove them? Are the council liable should an accident occur, and must they protect the obstruction by lighting and watching? What precautions should be adopted in both cases?

(1) In my opinion it is the duty of the owners of the fields to keep back the earth, and if they fail to do so after notice from the council they can be summoned for contempt under sec. 72 of the Highway Act, 1835. See *Coleman* v. *Harvey* (12 J.P. 39). But if notice of the obstruction was given to the council by a justice of the peace for the county it would be the duty of the council to cause it to be removed within twenty-four hours, under sec. 65 of that Act. This is rather more doubtful, but I think that if the owners of the trees failed to remove them after notice from the council, they would probably be liable to penalties of obstruction under sec. 72 of the Act, and the council could recover from them the expenses they were put to in the case of subsiding banks. In the event of such owners being a justice of the peace for the county, under that section the council would, in my opinion, of course have to provide for the lighting and watching of the obstructions pending their removal. Otherwise they might be held liable should an accident occur. As to the procedure in both cases, notice should be given by the surveyor to the owners requiring them to remove the obstructions, and if the notices are not complied with proceedings can be taken under sec. 72.

Highway Duties to Ordinary Use of Motor Car.—"L. C." writes: A gentleman driving his motor-car over a few months ago (at not excessive speed, I am assured) carelessly knocked a lamp, though not absolutely knocking it over. I immediately had it fastened up so as not to fall on pedestrians. I then wrote to the gentleman claiming damages, and he replied saying he was not liable, as the damage was caused through the car skidding, but without prejudice he did not mind undertaking to pay 25 per cent. of the cost. I was instructed by my council to write and decline his offer, and he has now replied that if I will get the work done he will be prepared to discuss the matter afterwards, but, of course, still without prejudice. My council have instructed me, in the absence of our clerk, to take legal proceedings. I shall be glad of your opinion. Can I issue the county-court summons for the recovery of the estimated damage, or is it necessary that the work should be done first, so as to ascertain the actual cost, and then issue the summons for that amount?

A summons can be issued at once, claiming as damages a sum sufficient to cover the estimated cost of repairing the lamp.

Building By-laws: Air-space.—"B. L. A." writes: A builder has submitted a plan of a new building on a plot of land situated between two public streets. Our by-laws are similar to the Model By-laws, and the air-space provided in front of the building is in conformity therewith. The height of the building is 25 ft. The extent of the air-space at the rear of the building is 150 sq. ft., but the distance across the space to the street boundary is only 10 ft. The street is 15 ft. wide. I shall be obliged if you will let me have your opinion as to whether the rear air-space is in order.

In my opinion the rear air-space is not in conformity with No. 54 of the Model By-laws. That by-law provides that, if the height of the building is 25 ft., the distance across the open space "to the boundary of any lands or premises immediately opposite or adjoining the site of such building" shall be 20 ft. at the least. In the present case, I am of opinion that the street is "land adjoining the site of the building" within the meaning of the by-law, and that, therefore, the distance across the air-space, measured to the street boundary, should be not less than 20 ft. See *Jones* v. *Parry* (57 L.T., 192). The width of the street is not material.

Rural District Councillor: Appointment as Surveyor.—"H. H." writes: Can a member of a rural district council, on the death of the surveyor, be appointed in his place as a paid servant? I believe in the Poor Law a member of the board must resign at least two years before being appointed.

Under sec. 46 of the Local Government Act, 1894, the appointment of a rural district councillor as a paid servant of the council would disqualify him from continuing to act as a member of the council, and it would be the duty of the council to declare his seat vacant and proceed to another election. See *R.* v. *Rickards* (70 J.P., 163).

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor readers with a view to making the information given under this head as complete and accurate as possible.

APPLICATIONS FOR LOANS.

Barrow T.C. £11,255 for electricity purposes.

Derby T.C.—£29,500 for the extension of the electric power station.

Merthyr T.C. £2,000 for the construction of a drain at Troedyrhiw.

St. Helens T.C.—£12,000 for electricity extensions.

LOAN REFUSED.

Bournemouth T.C. £1,200 for a motor fire engine and motor chassis.

FORTHCOMING INQUIRIES.

FEBRUARY.	£

Freezing of Water Mains and Services.*

By WILLIAM WHITLOCK BRUSH.

The transformation of water from the liquid to the solid state known as ice, as a result of the abstraction of heat from the water, is a process familiar to all, but the exact conditions under which such transformation takes place are not so generally known. This withdrawal of heat may be by means of radiation, conduction or convection, the transfer of heat being accomplished by any one of these agencies operating singly or in combination.

Fresh water increases in density as the temperature is lowered, until a maximum is reached at 39 deg. Fahr. There is then a gradual reduction in density to the temperature of 32 deg., when the liquid changes to the solid form known as ice, with a specific gravity of 0·89. It is this transformation that is particularly interesting to waterworks men, and some of the more important features of such transformation will be briefly discussed. The temperature of water is remarkably constant while ice is forming or melting. The temperature of the air may be many degrees below zero, but the temperature of fresh water, even though it be in a rapid running stream, will not be more than 0·01 below 32 deg. Fahr. Again, as long as there is ice in the water the temperature will only be a similarly small fraction of a degree above 32 deg. Fahr., even though the temperature of the air be many degrees above the freezing point. A mixture of ice and water forms the most constant temperature known to physicists.

It is popularly believed that running water may be lowered to a temperature of several degrees Fahr. below the freezing point before ice will be formed. This is an error. Absolutely still water may be cooled to approximately 10 deg. Fahr. below the freezing point without ice forming, but as soon as there is the slightest agitation of the water an immediate formation of ice takes place and continues until the heat released by the change from water to ice warms the remaining portion of the water to the freezing point. The latent heat of the water at the freezing point is large, amounting to 80 calories per gramme, or sufficient to raise 143 pounds of water 1 deg. Fahr. for every pound of water changed to ice.

FORMS OF ICE.

Ice is divided into three kinds, based upon the manner in which it forms *i.e.*, surface ice, frazil ice, and anchor ice.

Surface ice is the common form which appears on the surface of the water when the temperature of the water is cooled to the freezing point. It appears first near the shore and gradually extends out as the deeper water is cooled, the entire surface being eventually covered after the temperature of air remains below the freezing point for a sufficient period to cool the entire surface water to just below 32 deg. Fahr. After the ice is formed, the thickness increases, mainly through the conduction of heat from the water through the ice, it being necessary to conduct not alone the heat in the water, but also the latent heat previously in the water, which is released as the water changes to ice. As the conductivity of ice is low, being only one thirty-second of that of iron, this process is relatively slow, and the thicker the ice sheet the slower the increase in depth of ice.

Frazil ice is the form which appears in running water when the temperature of the water falls below 32 deg. Fahr., and where an ice sheet cannot form due to the agitation of the water. It forms at the surface, and may be made up of flat plates, if the surface is not greatly agitated, but more frequently is in the form of minute needle crystals which join together and form a bulky mass floating lower in the water than the ordinary surface ice.

Anchor ice is ice which is found attached or anchored to the bottom of a river or a stream, and results from the cooling of the material at the bottom of the river by radiation, and the resultant freezing of the water which comes in contact with the surfaces, which have been cooled below the freezing point. It will only occur under a clear sky and where there is nothing to interfere with the process of radiation. As dark objects radiate heat more rapidly than light-coloured ones, anchor ice will form more rapidly on a dark stone than on a light one. It will not be formed under a bridge where radiation is interfered with, nor under ice, which also prevents radiation. When the sun's rays strike the masses of ice, earth and stone, they are absorbed, and frequently the whole mass will become loosened and float to the surface. Large rocks are thus raised and carried down stream with the ice.

These three forms of ice are all of interest to the waterworks engineer, not alone as affecting the problems to be met at the source of supply, when such source may be a reservoir or stream, but also in the distribution of water, as will be shown later.

It is generally considered that ice is a poorer conductor than water. This belief is probably founded upon the very material protection which ice or snow gives against frost penetration. Such protection is mainly due to the resistance of ice and snow to the transmission of the heat waves of radiation. Clear water offers little resistance to the radiation of heat, but is a very poor conductor of heat. Due to the difference in density of water at different temperatures, water will transmit heat through convection, or the movement of the molecules, much more rapidly than will ice, by conduction. The molecules of ice are unable to move freely, and transmission of heat through ice, by convection, is therefore negligible.

Pressure lowers the temperature at which water changes to ice, but its effect is very slight; thus, a pressure of 1 lb. per sq. inch will lower the freezing point 0·009 deg. Fahr. Assuming the normal pressure in a water main to be 40 lb. per sq. inch, the lowering of the freezing point by such pressure would amount to less than 0·01 deg. Fahr.

The introduction of certain chemicals into the water lowers the freezing point. The most common chemical found is salt, and all are familiar with the lowering of the freezing point caused by the presence of salt. The volume of salt determines the temperature at which the ice forms, the salt being thrown out by the crystallisation of the water, so that ice formed in salt water is fresh. The ordinary sea water will freeze at about 27 deg. Fahr., and the temperature of the water is therefore well below the freezing point of fresh water. As the percentage of salt in the water decreases, the freezing point rises, but this freezing point is probably below 30 deg. Fahr. in the tidal waters surrounding our sea-bound cities.

FORMATION OF ICE IN WATER MAINS.

The formation of ice in water mains is dependent upon the temperature of the water in the main and the velocity of current, the pressure being of negligible effect, as has previously been shown.

It is probable that the water as drawn from a reservoir or stream is seldom below 33 deg. Fahr., as the formation of ice and the density of the water generally prevent the cooling of the water below this temperature. If the water in passing through the main is not reduced in temperature to below 32 deg. Fahr. there will be no danger of freezing. If it is reduced below 32 deg. Fahr. ice will begin to form, the ice forming a coating on the inside of the pipe, due to the high conductivity of the iron. As the ice film thickens, the transmission of the heat of the water to the surrounding earth and thence to the air is greatly retarded, the conductivity of ice being such a small fraction of the conductivity of the iron. If the velocity in the main is reduced through a lowering of the rate of draft, the water in the main is more readily cooled, and the rate of ice formation correspondingly increases.

This ice formation may be properly classified as surface ice. It is probable that in a main where the velocity is high the water is cooled slightly below the freezing point and a form of frazil ice created. Such ice might eventually clog the main, stopping the flow and the whole mass of water in the main quickly change to solid ice. A stoppage of flow may also occur after a thaw due to the loosening of the film of ice which has formed during the cold spell, and which may break up and float through

*From a paper read before the American Waterworks Association.

the water until it reaches a point in the main where the ice may not have broken loose and where the flow may be wholly packed in such a manner as to completely stop the flow.

While this might account for the stoppage of flow in mains, especially in house services, after a thaw, which is at times not uncommon to waterworks superintendents, there is a record of an actual reduction in temperature of soil below 32 deg. Fahr. following a thaw, and such reduction would be ample reason for the freezing up of water mains coincident with a thaw.

PREVENTION OF FORMATION OF ICE IN SUBAQUEOUS MAINS.

Where a main is laid in salt water it is common practice to lay the main without any earth cover. The iron is therefore exposed directly to the salt water, which is usually in motion, and heat may be rapidly abstracted from the water in the main through the three agencies of transmission—*i.e.*, radiation, conduction and convection. Radiation is active in clear water, and especially so from the black pipe. The iron is also an excellent medium for conduction, with the heat being absorbed from the surface of the iron by the water flowing over the pipe. Convection will readily do its part within the pipe. The temperature of the salt water during a period of severe cold may be lowered several degrees below the freezing point, and under such conditions ice will form in the water main, and the main will be completely clogged, unless the rate of flow is sufficient to maintain the temperature at the discharge end of the main at or above 32 deg. Fahr.

If a main is laid in a body of fresh water, there is little danger of freezing except at the point where the main enters the water, as the temperature of the water will be above 32 deg. Fahr., and a covering of surface ice will prevent excessive radiation. If the main is laid in the bottom of a rapidly-flowing fresh-water stream, it is possible that, through radiation and the cooling of the water in the stream, ice might form in the main, but it is improbable that such ice would be of sufficient thickness to interfere with the delivery of water through such main.

FROST PENETRATION ON LAND.

The committee of the New England Waterworks Association, which reported in 1909 on freezing of water mains, stated in their report that they had received ninety replies from 320 circulars sent out to waterworks engineers and superintendents, fifty-three communities had had trouble with freezing of mains, 50 per cent of the freezing had occurred at dead ends, and in all cases there had been little or no velocity.

In all but three cases the mains were smaller than 10 in. in diameter, and only seven as large as 8 in. in diameter. In every case the ground was frozen below the axis of the pipe; 40 per cent of pipe was laid in clay, 48·6 per cent in gravel, 5·7 per cent in sand, and 5·7 per cent in rock. The depth of penetration of frost was found to be 1 ft. greater in the streets than in the fields, and 1 ft. 5 in. deeper in gravel than in clay, the depth in sand being about midway between the depth in clay and in gravel. The ice was found at times in concentric rings in pipe as large as 24 in. in diameter, and no stoppage of the pipe had occurred. The ice formation was not always solid, but sometimes in the form of slush. The depth of frost penetration varied materially.

The committee called attention to a belief or tradition that existed in the minds of many plumbers and waterworks superintendents, that most stoppages occurred during a thaw, following a period of severe cold weather, it being suggested that this might be caused by evaporation from the surface during the early stages of the thaw, producing additional evaporation at reduction of temperature at the point of a water main sufficient to cause freezing. The committee suggested that the reports received did not support the theory.

PREVENTION OF FORMATION OF ICE IN MAINS AND SERVICES.

Where frost penetration has extended to and possibly beyond, the level at which a water main or service has been installed, the water in the main or service will freeze unless the temperature of the water in such mains is kept at or above 32 deg. Fahr. This can only be accomplished by having such quantity of water pass through the main that the rate of abstraction of heat will not be sufficiently rapid to cause the temperature of the water to fall below 32 deg.

By testing the temperature of the water as it is drawn from a hydrant, it can be determined whether there is or is not likelihood of the main freezing. No rule can be formulated which would answer the question as to whether a main will freeze under given conditions. A protecting covering is certainly a great aid in reducing the danger of freezing, and snow on the ground is an almost sure preventive.

THAWING ICE IN MAINS AND SERVICES.

The problem of thawing out frozen mains and services has been greatly simplified through the utilisation of the electric current at low tension. While it was found that this method was not of much value when applied to a main laid in water, where the heat generated through the passage of the electric current would be rapidly dissipated by the flowing current of water, the condition where the pipe is covered with soil is entirely different and much more favourable to the thawing of the main. As the electric current passes through the metal, the heat generated will thaw both the ice which is formed within the main and the ice which is formed in the soil outside of the main. The transmission of this heat to the surrounding earth and thence to the surface is very slow, and a comparatively small amount of current is required to make the necessary change from ice to water. It is not necessary to describe the actual application of electricity to the mains, as this has been set forth in detail many times.

CORRESPONDENCE.

Εἷς ἀνὴρ οὐ πάντ' ὁρᾷ

—Euripides.

THE CIVIC SURVEY OF SOUTH-EAST LANCASHIRE.

To the Editor of The Surveyor.

Sir,—I am sorry Prof. Abercrombie feels that the town planning article in your Annual Issue does him and the architects associated with him on the Civic Survey of South-East Lancashire an injustice, for that was far from the intention of the writer of the article. From the tone of his letter he appears to be more piqued at the shortness of the notice than at any lack of accuracy in the criticism; but as your readers were referred to the very full description and discussion of this survey in your columns of October 27th last, I do not think he could reasonably expect much space to be devoted to it in your Annual Issue.

I think Prof. Abercrombie hardly does the writer justice in merely quoting the damnatory part of the sentence, and omitting the laudatory portion. Speaking of the plans, I said, "while they came in for a good deal of admiration for their novelty and artistic character, they, unfortunately, showed the lack of practical requirements which is so often associated with fine artistic qualities." I see no reason to alter this opinion, and I am somewhat surprised that Prof. Abercrombie should take exception to so mild a criticism after the admissions he made at the meeting in Manchester. He said the committee of architects responsible for this survey were practically experimenting, had made several mistakes which they hoped to avoid in the future, and invited suggestions from the municipal engineers present for the improvement of the plans.

The writer of the article was present at the Manchester meeting, and he certainly got the impression that the admiration for the industry and artistic ability shown in the production of these plans was largely discounted by the disappointment felt at the want of grip of practical requirements that they displayed. When architects undertake to do engineering work mistakes are almost bound to be made, and the Professor's letter shows how dangerous it is for municipal engineers to ally themselves with such undertakings, for he practically saddles them with the responsibility for its failure.

To deal with the principal exhibit first—the traffic plan of the roads in the Manchester district. The idea of this plan was admirable; but for it to possess any practical value it should have been complete and accurate, and, unfortunately, it could not claim to be either. A census of traffic which makes no distinction between a motor bicycle and a steam lorry is of no value, as it affords little assistance to those who have to decide on the necessary width of

the road, not to speak of a matter of equal importance to councils and their surveyors, the wear and tear of the roads. When this census is restricted to one hour in the day, and produces the astonishing results shown on this plan, one is certainly justified in saying it has little practical value.

Although the architects engaged on this work had local experience to guide them, they did not realise that a census for one hour only would probably give a very misleading idea as to the maximum traffic, if the outgoing and incoming traffic maximums were required. The plans showed that the traffic on one side of the road was twice as great as that on the other, and it remained for a local municipal engineer to point out that this lop-sided result was due to the traffic leaving the docks early in the day, and returning from other towns at a later hour than that at which the census was taken.

The Professor defends this action by saying that "if it took one year of the work of the staff to obtain the traffic counts of one hour each, it would take twelve years on the basis of twelve hours." The sensible way of looking at it appears to me to be that if they had not got the staff to do the work properly they should not have spent time and money in obtaining a census which could only be inadequate and misleading. The work which seems so stupendous to Prof. Abercrombie was being done by municipal engineers all over the country when the war broke out. Nearly every county and borough surveyor in this country was engaged in taking a census of traffic in August, 1914, and was taking it not for one hour only, but from twelve to twenty-four hours in the day, for a fortnight. Not only did they do the work for this greater length of time, but they also took much fuller and more accurate particulars; for it is evident to the merest tyro in municipal engineering that the mere number of vehicles using a road is of little value for practical purposes, and that the character and approximate weight and speed of the vehicles is also necessary.

Another matter to which reference was made in the discussion was the attempt to show on one plan, by over twenty different colours, the various classes of buildings and lands. The result was, as might easily have been anticipated, that we found a riot of colour which might find favour in futurist art circles, but to most men it simply represented confusion and chaos.

One other remarkable feature of the exhibition was the large scale hill-shaded contour plans, which had been produced to assist water engineers with their water supply schemes. Without questioning the industry and artistic qualities of the draughtsman who prepared this and the smaller scale contour plans, one may ask where a water engineer needs a 1/2500 coloured contoured plan for a preliminary watershed scheme? The scale of tone values on the large and small scale plans were dissimilar, and one could not help feeling that they had been prepared more with the view of offering scope for the colourist than of being of any great service to the engineer. Prof. Abercrombie said in his opening remarks that they had hoped at first to revise the Ordnance plans, but found that their architectural training was not of the character required for making an accurate revision of these plans. They have probably found that this is not the only direction in which their limitations have put a stop to their good intentions, and one can only wonder at the assurance they display in tackling the levelling necessary for the preparation of a contour plan to so large a scale as that exhibited at Manchester.—Yours, &c.,

THE WRITER OF YOUR TOWN PLANNING ARTICLE.

BUILDING BY-LAWS.

To the Editor of THE SURVEYOR.

SIR,—I was very glad to see your note this week about by-laws. If your practical journal continues, as it has in the past, to help these regulations to evolve into something more efficient, it will indeed be doing valuable work.

But why not be "light-hearted" about the matter in these drab days? Up to now we have treated the by-laws far too reverently, perhaps on account of their age. As they grow older they hardly—as Alice would say—become "betterer and betterer." Some of them, although over military age, certainly ought to go!

And have the existing by-laws effectively checked "the gentle art of jerry-building"? An inspection of suburban property built around London during the last fifteen years makes one wonder.

I fail to see inconsistency between my two statements that "the abolition of many of these out-of-date and inconsistent enactments is now a matter of national importance," and "to keep up a high sanitary standard, and to prevent flimsy construction, is essential." The differentiation, according to district, is, of course, most necessary, and in itself presents a first-class problem.

In many neighbourhoods the present system has absurd results. At the moment I have in front of me a pile of by-laws, all relating to districts in which the local conditions are almost alike. The varying requirements insisted on by the different authorities is extraordinary.

Lately, and since the publication of my book, "The Cheap Cottage and Small House," which contains a chapter on by-laws, I have received a good deal of correspondence from landowners, council officers, and others, confirming my assertion as to the cottage famine being partly due to the harsh building regulations in force in rural parts. Never before has this lamentable shortage in the supply of country dwellings been so serious. The old cottages, picturesque certainly, but usually in irremediable disrepair, have not been renewed; to build in accordance with urban by-laws, or those based on urban requirements, is too expensive. The detached rural dwelling, especially, has almost ceased to be. Our countryside is becoming depopulated.

Take, as an example, a tiny cottage I am now carrying out for the use of an agricultural worker. From the site—which is seven acres in extent, and "miles from nowhere"—not a house is to be seen. The by-laws allow a shed to be built in 4½ in. brickwork, but an inside wall between the cottage and this shed (over which the main roof is continued) has unnecessarily to be 9 in. thick. The drainage consists merely of a sink waste. But the local authority insists on a cesspool being built at least 60 ft. away from the building. So my client is put to the expense of excavating for and laying over 75 ft. of 4-inch glazed stoneware pipes. Each end of the system has to be ventilated, as does the cesspool, which must be built of brickwork surrounded with concrete.

And this in War-loan days, when labour and building material have never been so scarce and costly!—Yours, &c.,

GORDON ALLEN, F.R.I.B.A.

Holmdale-road, Hampstead,
Feb. 10th, 1917.

DECIMAL WEIGHTS, MEASURES, AND COINAGE.

To the Editor of THE SURVEYOR.

SIR,—I venture to point out that Mr. Barton's reply to my letter (in your issue of February 2, 1917) is really no answer at all. Will you allow me to put him the following questions:—

(*a*) Is it true, or not true, that a metre of 39·6 in. exists in British weights and measures (see "The Encyclopædia Britannica," Vol. xxiv., page 484, paragraphs 13-3?

(*b*) Is it true, or not true, that this metre is still to be found in our rod, pole, perch, chain, furlong, square rod, rood, and acre?

(*c*) Is it true, or not true, that our British ton is metric, with reference to the ancient Belgic yard, which goes back to the third century, in this island's history, and which can be traced back to ancient Egypt?

(*d*) Is it true, or not true, that this Belgic yard is within one-thousandth part of accuracy as an earth metre, while the French metre is over ¼ inch short?

(*e*) Is it true, or not true, that the adoption by us of the metric system would benefit the Central European Powers, most of all European metric countries?

(*f*) Is it true, or not true, that the re-establishment of our ancient metric system would cause us no inconvenience at all?

(*g*) Is it true, or not true, that the compulsory adoption of the metric system would cause us immense inconvenience and loss? If not, why not?

I think, Sir, that is enough to begin with. I sincerely trust I have not been called a prophet in vain, though I expect little honour in my own country and in my "father's house"! I am consoled by recollecting that metric advocates have prophesied the "coming of the metre," so may share my disgrace!—Yours, &c.,

E. A. W. PHILLIPS, M.INST.C.E

Hove, February 12, 1917.

Municipal Work in Progress and Projected.

In addition to the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars have reached us during the present week. Other reports will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Bedford T.C. The town council have adopted a recommendation of the Public Works Committee instructing the borough surveyor to intimate to owners, occupiers and agents of property that, where desired, the work of making good defective fittings could be done by corporation plumbers at the cost of the persons giving the orders.

Bournemouth T.C.—The borough engineer, Mr. F. P. Delaney, has received instructions to prepare plans and estimates for a timber groyne at Portman Ravine; the two timber groynes near the western and eastern ends of the sea wall at Fisherman's walk; for a kiosk at Fisherman's walk, and for a lavatory at Fisherman's walk.

Swansea T.C. During consideration of plans at a meeting of the Highways Committee, the borough surveyor, Mr. J. R. Heath, objected to a certain plan on the ground that the light of the back window was obstructed by the proposed new building in the back portion of the house, and the by-laws were therefore contravened. The chairman (Alderman T. Merrells): Many are doing this kind of thing in ignorance. I do not want to suggest that we should take proceedings, but they are all liable to be prosecuted. It is only by chance that we find this out. The plan was not passed and the warning was ordered to be sent out that any similar contraventions in future would result in a prosecution.

HOUSING AND TOWN PLANNING.

Chesterfield T.C. A scheme involving the erection of 200 houses is in course of preparation.

Coventry T.C. The erection of 200 houses off Park Street is being considered.

MOTOR TRANSPORT.

Birmingham T.C. The corporation have purchased from Messrs. Clayton & Shuttleworth, of Lincoln, a 5-ton steam wagon with end tipping body, for the use of the water department.

Bolton T.C. It has been decided to purchase a battery-equipped tipping wagon.

Cheltenham T.C.—An Orwell battery-equipped van has been purchased from Messrs. Ransomes, Sims & Jefferies for £721.

Cork T.C. The chairman of the Public Works Committee, Mr. D. Horgan, asked the committee to consider the question of adopting motor vehicles. He read a report of the adoption of motor vehicles for scavenging by the Brighton Corporation. One motor vehicle would do the work of six horses. Their streets were good and the channels were worse. They had been subjected to much criticism and should take steps to remedy things. The matter will probably receive attention at a conference which it is proposed to hold with the Public Health Committee with respect to street cleansing.

Hetton U.D.C.—Estimates are being obtained of motor and other lorries for scavenging work.

Leyton U.D.C. A battery-equipped van has been purchased for refuse collection for £1,075.

Manchester T.C. A 5-ton steam wagon has been purchased for use in connection with street paving work.

Morley T.C. The purchase of a motor wagon is being considered by the Sewage Purification Committee.

Rotherham T.C. It is intended to purchase a motor van for the gas and lighting and tramways department.

St. Helens T.C.—The Gas and Lighting Committee propose to purchase a steam motor wagon.

Walsall T.C.—The Public Works Committee recommend the purchase of a motor lorry at a cost not exceeding £361.

Wolverhampton T.C.—The manager of the motor omnibus department has received authority to purchase two Tilling-Stevens petrol-electric chassis, together with two bodies, at an estimated cost of £1,016 each.

REFUSE COLLECTION AND DISPOSAL.

Camberwell B.C. The borough engineer, Mr. W. Oxtoby, in his annual statement on the estimates, says he thinks that from a public health point of view it is madvisable to reduce the estimate for the removal of house refuse.

Edinburgh T.C.—The prices obtained for the waste paper after it has been sorted vary from 31s. 3d. per ton for the "mixed" to 90s. for the "white." During the six months ending December the quantity of paper sold amounted to 497 tons 4½ cwts., and the price realised was £1,188. The cost of sorting is approximately 10s. per ton.

Hove T.C. The town council have confirmed the recommendation of the Sanitary Committee with respect to the removal of house refuse for the half-year ending September next. The present contract is £5,860 per annum, and the committee recommended that the terms of the same contractor be accepted for the next half-year, his price being £3,600, with a reduction of £60 per month for any month on which it should be arranged that the collection should only be once a week and the twice-weekly collection waived.

Newport (Mon.) T.C.—The Refuse Destructor Committee are considering the question of putting down plant for the manufacture of fertilisers in order to assist in the cultivation of the land.

ROADS AND MATERIALS.

Axminster R.D.C.—The council have written to the county council stating that the council were of opinion that no tarring of roads should be done this year in any part of the county. However, if a grant was made to other councils, the council felt they should be equally treated.

Birmingham T.C.—The general manager of the tramways undertaking has been instructed to prepare a scheme of subways for the central districts.

Broadstairs U.D.C.—The council have approved the plan and estimate of the surveyor, Mr. H. Hurd, for the diversion of the promenade footpath at the Western Esplanade, opposite Leybourn-road, at an estimated cost of £125.

Cambs C.C. The council have adopted an estimate of £21,771 for road maintenance, to be apportioned as follows: Patching with granite and tarred slag, with steam rolling, £12,818; ditto, with the addition of further coating: Between Foxton and Royston (tarred slag), £1,189; between Fowlmere and Flint House, £972; between Newmarket and Fordham, £394; between Burwell and Fordham, £306; between Newmarket and Thetford, £1,154; between Horseheath and Haverhill, £199; on Huntingdon road, near New Inn, £238; between Eltisley and Whitehall, on St. Neots road, £485; at foot of Arrington Hill, on Old North Road, £212; near Arrington Bridge, on ditto, £165; between Orwell and Tadlow, on Potton road, £188. The council have also approved a provisional estimate of £6,000 for tarring. The complete provisionally estimated expenditure upon rural roads for the year is £32,376, and for the borough of Cambridge £7,401, making a total of £39,777.

Colchester T.C.—With reference to the proposal of the Road Board to construct a road across the Abbey Field, the Parliamentary and Footpaths Committee express the opinion that a proper footpath should also be made.

Dublin T.C.—The city council on Friday last passed a resolution in favour of widening Earl-street by 14 ft.

East Grinstead R.D.C.—The surveyor, Mr. C. Turton, has been instructed to obtain an estimate for converting a steam roller into a traction engine, and also the cost of two carts, for the purpose of hauling road materials.

East Molesey U.D.C.—The surveyor, Mr. J. Stevenson, has been instructed to offer the council's tumbler cart for the Army in France, provided the council are repaid the cost of replacing it. With reference to a request for the council's men to take up

road service in France, it was reported that all the workmen are over military age.

Felixstowe U.D.C.—It has been agreed to purchase 20,000 gallons of tar from the gas company for road tarring, with the option of a further 5,000 gallons at 49s. 6d. per ton nett.

Folkestone T.C.—The repair of Canterbury-road has been the subject of a conference between the borough surveyor and the county surveyor.

Littlehampton U.D.C.—The purchase of 85 tons of flints at a price not to exceed 5s. 9d. per ton has been approved, the material to be used in Selborne-road and Church-street. The council have concurred in the surveyor's suggestions as to control and hours of the men, as the council had now left the management and control of the workmen in his hands.

Luton T.C.—The county council will be asked to contribute to the cost of the proposed widening and improvement at Amen-corner, Church-street.

Manchester T.C.—The cleansing department, the *Manchester Guardian* states, has been handicapped by the absence of labour in dealing with the snow. In ordinary times there are 500 men employed on the streets; to-day only half that number are on the books, and many of these are new and elderly men. Casual labour used to be abundant at the time of a snowfall, the number of applicants often reaching a thousand. On one day not a single man applied for work. The department before the war employed seventy orderly boys for collecting litter, tram tickets, and rubbish. Only one boy is left, and he is partly a cripple. So it is then that the squeegee for cleaning the pavement is now seldom seen.

Paddington B.C.—The annual estimates include a proposed expenditure of £8,400 for repaving Eastbourne-terrace from Bishop's-road to Praed-street.

Scarborough R.D.C.—The surveyor, Mr. J. A. Iveson, has been instructed to arrange a conference with representatives of the Sherbur Rural District Council on the subject of the proposed new road between Cayton and Folkton.

Teddington U.D.C.—Mr. M. Hainsworth, the surveyor to the council, has been authorised to whiten the bases of all the electric street standards, the consent of the tramway company having been obtained.

Westhampnett R.D.C.—The council have approved a report by the Highways Committee stating that, from particulars furnished by the surveyors, it was found that approximately 4,150 cub. yds. of material which the council had agreed to purchase under the estimates approved for the year ending March 31, 1917, remained undelivered at date, and that of the material already delivered to the council's depots the surveyors estimated that upwards of 5,000 cub. yds. would remain unused at the close of the present season's repairs owing to the difficulties experienced in obtaining the necessary labour. Having regard to existing labour conditions, and the probability of further restrictions, the committee were of opinion that the estimates for the ensuing year should be strictly limited to the actual amount to be expended by the council in respect of the year ending on March 31st next, and therefore recommended that the surveyors be directed to prepare and limit their estimates accordingly. The committee further recommended that, provided the necessary arrangements could be made, the whole of the highways previously treated with tar should again be so treated during the ensuing summer.

West Sussex C.C.—The Roads and Bridges Committee have been authorised to purchase a portable tar-macadam mixing plant at a cost not exceeding £220, and a grit-distributing machine at a cost not exceeding £30.

Winchester R.D.C.—The council have received £1,000 from the Road Board towards the cost of road maintenance.

SEWERAGE AND SEWAGE DISPOSAL.

Herts C.C.—It has been decided to construct a culvert at Clapgate Ford, at an estimated cost of £200.

Lincoln T.C.—The borough surveyor, Mr. R. A. MacBrair, has received instructions to submit particulars of any sewerage works that may be included among the schemes to be carried out after the war.

Whitefield U.D.C.—The Local Government Board have intimated that one of their inspectors will visit the district in connection with the application of the council for a loan of £960 for an ejector pit and electrical machinery.

WATER, GAS, AND ELECTRICITY.

Keighley T.C.—The Electricity Committee recommend the town council to make application for a loan of £2,000 for an extra high-tension cable.

Leeds T.C.—The Electricity Committee recommend that a loan of £17,128 should be obtained for electricity plant.

Newport (Mon.) T.C.—A report is being prepared on the sinking of the trial holes at Talybont, where it is proposed to construct a new reservoir.

Perth T.C.—The effort to obtain an augmented supply by the sinking of artesian wells has not, thus far, been successful. A well has been sunk at the waterworks to a depth of fully 200 ft., but rock has not yet been reached. The contractor has been asked to submit an offer for boring an additional 50 ft.

Swindon T.C.—The town council have approved a number of proposals submitted by the borough engineer, Mr. H. J. Hamp, for the improvement of the water supply.

Torquay T.C.—The units generated at the electricity undertaking during the past year showed an increase of 6·47 per cent on the previous year's output.

MISCELLANEOUS.

Holywell R.D.C.—There was submitted recently a joint report of the Holywell inspector and medical officer as to the effect upon the sanitation of Greenfield valley, through which the stream from St. Winefride's Well used to run, of the drying up of the waters of that famous shrine. It was pointed out that when the pools in the valley became stagnant in dry weather a nuisance might arise, and it was suggested that there should be a joint conference between the council and the Holywell Urban Council, which would be productive of more good than separate action of the two authorities. It was decided to defer the matter until the arrival of the report of Dr. Manley, of the Local Government Board, who recently made an inspection of the district.

Newhaven R.D.C.—Delegates have been appointed to attend a conference called by the Rottingdean Parish Council to inquire into and deal with the question of coast erosion between Rottingdean and Brighton.

FOR OTHER ADVERTISEMENTS
See End of Paper.

TWICKENHAM URBAN DISTRICT COUNCIL.

CONTRACTS.

The above-named Council hereby invite Tenders for the undermentioned Goods or Materials for a period of one year from the 1st April next:—

(1) Broken Granite; (2) Shingle, Flints, Gravel and Sand; (3) Granite Kerb, Channel and Quadrants; (4) Granite Cubes and Setts; (5) Portland Cement; (6) Steam Coal and Rough Slack; (7) House Coal and Coke; (8) Forage; (9) Oil and Colourman's Goods; (10) Iron Castings; (11) Street Gullies and Drain Pipes; (12) Tar-slag Macadam; (13) Tar-paving.

Forms of Tender and Specification for the whole of the above may be obtained upon application to Mr. Fred. W. Pearce, F.S.I., Surveyor to the Council, Town Hall, Twickenham.

Sealed Tenders, endorsed "Tender for ——," are to be delivered to me by hand, or by registered post, on or before noon on the 2nd day of March, 1917.

The Council do not bind themselves to accept the lowest or any Tender, and any person whose Tender may be accepted may be required to enter into a proper Contract, with, if required, two sureties to be approved by the Council.

The Tenderer whose offer is accepted shall be held to have bound himself to an agreement, and may be compelled to carry out the obligations arising from his Tender, even though he may not have signed a formal Contract.

(By order)

H. JASON SAUNDERS,
Clerk to the Council.

Town Hall,
Twickenham.
February 14, 1917. (3,312)

PERSONAL.

Mr W H Matthews Jones, city surveyor of Chester, has been elected a member of the Institution of Civil Engineers.

Mr J S Pickering, borough surveyor and water engineer of Cheltenham, has had his salary increased from £600 to £700 per annum.

Mr R E H Heenan, of the firm of Heenan and Froude, Limited, Worcester, has been elected an associate member of the Institution of Civil Engineers.

Mr S Hutton, surveyor to the Exmouth Urban District Council, is to receive £150 a year from the council while on military service, with a corresponding reduction in the event of his Army pay being increased.

Mr W P Robinson, one of the county surveyors of Devonshire, has received a commission in the Army, and Mr. W. J. Simpson, formerly surveyor at Honiton, has been appointed to act during Mr. Robinson's absence.

Lieut.-Col. Blackwell, county surveyor of Cambs, has received the hearty congratulations of the county council upon the honour conferred upon him by His Majesty the King in his appointment to be a companion of the Distinguished Service Order.

Dennis Hallinan, a workman in the borough engineer's department, Camberwell, who is now a sergeant in the 6th Royal Irish Regiment, serving in France, has been awarded the Military Medal. Hallinan has received the congratulations of the borough council upon achieving this distinction.

Mr Lansdown, assistant surveyor to the Hinckley Urban District Council, has been called up for Army service. The surveyor, Captain E. H. Crump, is also away on military service. Meanwhile the business of the department will be kept going by Mr. W. Johnson and Mr. A. Jeffcoate, members of the council.

Mr. E. R. L. Henderson has been appointed acting engineer, surveyor and waterworks manager to the Abertillery Urban District Council during the absence of Mr. Lionel D. Lewis, who has taken up road construction work in France. Mr. Henderson has for the past four years been deputy surveyor at Abertillery.

Mr. Moynihan, assistant borough surveyor of Dublin, and his staff, are warmly complimented by the *Freeman's Journal* upon their efforts to maintain the regular water services during the recent frost. "No matter what the hour," the writer states, "they have responded readily, and but for their prompt steps the wastage of water would have been greater."

Mr Fred. C. Uren, the surveyor to the Aldershot Urban District Council, has contributed largely to the literature of waterworks engineering, and his recent paper before the Institution of Civil Engineers of Ireland is a notable addition to his writings on the subject. He is the author of "Waterworks Engineering," a book of incalculable value to students in acquiring the all-important knowledge of details of actual construction. Too often the writers of such books are content to assume that their readers already have some acquaintance with the subject, and fundamental principles and points of daily practice that can only be acquired from actual experience are not mentioned. In his book Mr. Uren has endeavoured—and with a considerable amount of success—to repair this omission, and gives in detail, from his own practice and that of other engineers, numerous illustrations and examples of small and large undertakings, from their incipient stages to the completed work.

Colonel Brotherton, of Leeds, chairman of Messrs. Joseph Crosfield and Sons, Limited, chemical manufacturers, who have works at Leeds, Birmingham, Liverpool, Warrington, Widnes, Sunderland, Middlesbrough and Glasgow, has invested £500,000 in the War Loan. Colonel Brotherton was Lord Mayor of Leeds when war broke out, and his large subscription to the War Loan may be regarded as a fulfilment of a promise he made to the City Council to give all the financial support in his power to the Government in the prosecution of the war. The son of a Lancashire cotton manufacturer, he was born at Manchester, educated at Owens College, and began his commercial business career at Wakefield nearly forty years ago. He was elected as representative of Wakefield in Parliament in 1902 when his opponent was Mr. Philip Snowden, and at the December election of 1910 he was defeated by Mr. A. H. Marshall. He was Mayor of Wakefield in 1902. He is honorary colonel of a Leeds battalion, in the raising of which he took a leading part during his Lord Mayoralty, and has been a generous supporter of the various war funds which he opened in 1914.

Mr. Stephen A. Bennett, whose appointment as county surveyor of Monmouthshire has now been confirmed, is a native of that county, and is thirty-eight years of age. He has been rejected for active service in the Army. He has passed the examination of the Associate Membership of the Institution of Civil Engineers, also the Professional Associate and Fellowship diploma examinations of the Surveyors' Institution. He has been in the service of the county council for ten years, and was appointed deputy surveyor in 1913. His professional training commenced at Pontypool, in 1895, where he spent a period of four years as pupil to Mr. D. J. Lougher, architect, surveyor and civil engineer. At the close of his pupilage he joined, as surveyor, the engineering staff of the Lancashire and Yorkshire Railway, under Mr. W. B. Worthington, B.SC., M.INST.C.E., chief engineer, and was appointed

Mr. Stephen A. Bennett,
New County Surveyor of Monmouthshire.

assistant resident engineer for the Brighouse, Heaton Lodge and Mirfield contracts. His subsequent position, in 1903, was that of chief assistant to Major H. F. Stephens, ASSOC.M.INST.C.E., of Tonbridge, for whom he prepared Parliamentary schemes for new railways and bridges in Kent, Devon and Cornwall. He was engaged as engineer to Messrs. Gates & Hogg (public works contractors), Doncaster, in 1904, for the Dearne Valley new railway, from Thurnscoe and Denaby, Yorkshire. His London experience was gained in 1905, under Messrs. R. W. Blackwell & Co., who were at that time contractors for the new conduit tramway and street widenings from Camberwell Green to Crystal Palace-road, London, S.E. In this contract was included the lowering and reconstructing of Dog-kennel-hill, Dulwich.

OBITUARY.

Mr. Thos. Salmond, ex-chief engineer of Belfast Harbour, and formerly assistant engineer to the Clyde Navigation Trust, died at Belfast on Saturday.

We regret to learn from the *Hereford Times* that the worst fears of his friends have been fulfilled in regard to Sapper R. Dunkeld, Royal Engineers, who up to the time he joined the Army was surveyor for the Dore district of Herefordshire. He was very seriously wounded in action on the Western front some four weeks ago, but the doctors had hope of his recovery, even though his condition was precarious. Our contemporary has, however, since received from his friend Corporal F. Britten, his predecessor at Dore, the sad tidings that Mr Dunkeld succumbed to his injuries on January 26th; complications arose necessitating a further operation, after which he sank. The deceased soldier, who is a Scotsman was only 26 years of age. He was appointed surveyor of Dore district just over two years ago.

PUBLIC AUTHORITIES AND THE CONTROL OF STREET ARCHITECTURE.

By Arthur F. Wickenden, A.R.I.B.A., P.A.S.I.,
Deputy City Building Surveyor, Birmingham.

The artistic development of our cities and towns was, at a period not so very remote, a question which appeared to be only of interest to those intimately connected with the practice of the arts, and the subject rarely advanced beyond the limitations of an excellent topic for endless papers and discussions at architectural conferences and similar gatherings. To-day the lay criticisms of architectural works so frequently heard expressed or met with in newspapers are conclusive evidence that we, as a nation, are at least beginning to show a greater appreciation of beauty in our surroundings. This welcome indication is doubtless one of the first fruits of the artistic education now brought within the reach of the masses by our art and technical schools, and if zealously fostered is full of promise for the future.

The man in the street, instead of being content to gaze upon pictures or read about the architectural beauties of other lands, is becoming desirous of realising them in his own home and country.

The Housing and Town Planning Act of 1909, whatever else can be urged for or against it, has certainly made it possible for future towns to be developed upon artistic principles, but under the present state of affairs the improvement of our existing cities and towns not within town-planning areas is greatly hindered by the lack of any authoritative artistic jurisdiction. The question of public control of street architecture is bristling with difficulties, but, in spite of the fact that we are essentially a freedom-loving people, and like to feel at liberty to do what we please with our own property, the need of some form of control is now admitted by the majority of those qualified to express an opinion in the matter. We have Acts of Parliament and by-laws enough and to spare in the judgment of many who come into collision with them to ensure the safe construction and sanitation of all buildings, but no legislative protection against flagrant violation of recognised canons of good taste or architectural principles, so that the work of incompetent and untrained designers may go practically unchallenged, excepting in the case of the limited powers exercised by certain landowners and corporations acting as freeholders of surplus lands acquired in carrying out street improvements. Even these powers are often not used to the utmost, owing to a keen desire to dispose of awkward-shaped sites.

That an intelligent supervision should be exercised over civic design would therefore appear evident, but the confronting problem is as to the extent and nature of such control.

GOOD AND BAD ARCHITECTURE.

While it is quite impossible to give a definite reply to the question, "What constitutes good or bad taste?" at the same time the answer certainly is not that it is entirely a matter of opinion. There are laws in art.

Ruskin, in his "Stones of Venice," writes: "No man can speak with rational decision of the merits or demerits of buildings: he may with obstinacy; he may with resolved adherence to previous prejudices; but never as if the matter could be otherwise decided than by majority of votes, or pertinacity of partisanship. I had always, however, a clear conviction that there was a law in this matter; that good architecture might be indisputably discerned and divided from the bad; that the opposition in their very nature and essence was clearly visible; and that we were all of us just as unwise in disputing about the matter without reference to principle as we should be for debating about the genuineness of a coin without ringing it."

It is quite obvious that to place any hard and fast restrictions upon the details of the design of individual buildings would be absolutely fatal to the development of architectural character or to the hope of ever producing a work of genius.

The extent of any artistic control vested in public authorities should be strictly limited to the general problems of street arrangement, collective architecture, scale, alignment and environment of buildings, and the preparation of the setting to receive the separate works designed only by properly-trained and qualified architects. For example, the controlling authority should determine whether in a street picturesque charm should be gained by the random irregularity of building line and façades, or whether dignity should be attained by deliberate symmetrical planning and the due uniformity in the design of elevations.

NATURE OF JURISDICTION.

The subject of the nature of the jurisdiction largely resolves itself into the question of whether the controlling power should be in the hands of an individual or of a committee or board of control.

The chief argument in favour of the former is that true art is the product of an individual rather than of a committee. Those who advocate corporate power insist that any scheme involving the control of one man, however brilliant he might be, would lead to an undesirable uniformity of style.

I am of opinion that the most likely successful solution of the problem would be the appointment by the various local authorities of consultative committees composed of architects and artists of repute, and presided over by a chairman who was neither an architect nor artist, and who would thus be comparatively free from narrow prejudices in favour of any particular style or school of design, but who should be a man of recognised education and refined taste, and of sufficient business ability to weigh the different opinions of his expert colleagues. A schedule of the principal streets of the city or town should be prepared, and plans and elevations for all buildings which it was proposed to erect in any of these streets should be submitted for the consideration of this advisory committee, who should, after conferring with the architects concerned, report to the city or town council as to any suggested modifications in the design.

The local authorities should be empowered, if necessary, to enforce any of the amendments thus recommended before sanctioning the erection of the building.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

SOUTH WALES DISTRICT.

A general meeting of the members of the South Wales District will be held at the Gwyn Hall, Neath, at 4 p.m. on Saturday, February 24th.

AGENDA.

1. To read minutes of previous meeting.
2. To nominate district representative, district chairman, and hon. district secretary for the ensuing year.
3. To make arrangements for spring and summer meetings.
4. To consider circular from Mr. O. Claude Robson in reference to the Orphan Fund.
5. An informal statement of work required for initial stage of a town planning scheme, by Mr. D. M. Jenkins, Assoc.M.Inst.C.E., borough engineer, Neath.
6. Any other business.

H. Alex. Clarke.
Hon. District Secretary.

Briton Ferry.

A Glossary of Road Terms. By H. Percy Boulnois, M.Inst.C.E. St. Bride's Press, Limited, 24 Bride-lane, Fleet-street, E.C. Price 2s.—Mr. Boulnois has achieved far more than he may imagine by this production of his pen. He set out to standardise the nomenclature of road terms; in addition he has made a valuable addition to English literature. To the untutored it is like reading a new language; Mr. Boulnois says it isn't anything like "complete." At any rate, it is a valuable *vade mecum* which no one has attempted before.—*Portsmouth Times.*

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

INSPECTOR OF NUISANCES.—February 17th.—Chatham Town Council. £200—£250.—Mr. J. Holgate, medical officer of health, Town Hall.

CHARGE ENGINEER.—February 19th.—Hood Urban District Council. £120-£150 a year.—Mr. A. H. Shaw, engineer and manager, Electricity Works, Ilford.

SURVEYOR.—February 19th.—Dartford Urban District Council. £120 per annum. Mr. W. Robinson clerk, 17 Regent-street, Barnsley.

ENGINEER.—For road-making, water supplies, drainage, and buildings.—Box No. 7,996, care of A. J. Wilson & Co., Limited, 154 Clerkenwell-road, London, E.C.

STOREKEEPER.—Sheffield Corporation Water Department.—Mr. William Terney, general manager, Water Department, Town Hall, Sheffield.

DESTRUCTOR WORKS FOREMAN.—Beeston Urban District Council.—Mr. G. F. Grimwood, engineer and surveyor, Public Offices, Beeston, Notts.

MUNICIPAL CONTRACTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

Buildings.

BOURNEMOUTH.—February 19th.—For taking off existing roof and constructing new roof and other works at Branksome Lodge, for the corporation.—Mr. F. P. Delamore, borough engineer and surveyor, Municipal Offices.

DERBY.—February 20th.—For an extension to the electric power station, for the corporation.—Mr. J. Ward, borough surveyor, Babington-lane, Derby.

MANCHESTER.—February 21st.—For the excavation of foundations for cooling tower tanks, for the Electricity Committee.—Mr. F. E. Hughes, secretary Electricity Department, Town Hall, Manchester.

OLDHAM.—February 21st.—For the erection of a verandah and other works, for the Tramways Committee.—The Borough Surveyor.

HAMMERSMITH.—February 23rd.—For alterations to certain properties in Scrubb's-lane, for the borough council.—Mr. H. Mair, borough surveyor, Town Hall.

LOUTH.—February 28th.—For the erection of bathrooms at the county infirmary.—Mr. V. J. O'Connell, architect, Earl-street, Dundalk.

TETBURY.—February 28th.—For the erection of an engine-house, pump-house, gas-producer house, and other works, for the urban district council.—Mr. H. J. Weaver, superintending engineer, Northgate Mansions, Gloucester.

NORWICH.—March 1st.—For general repairs to a certain property, for the corporation.—Mr. A. E. Collins, city engineer, Guildhall, Norwich.

SHEERNESS.—March 14th.—For the construction of pumping station buildings and other works, for the urban district council.—The Water Engineer, Trinity-road, Sheerness.

Engineering: Iron and Steel.

GLASGOW.—February 19th.—For the supply of gas-coolers and grease pot for the corporation.—Mr. A. Wilson, 45 Johnstone-street, Glasgow.

PONTYPRIDD.—February 26th.—For the supply of cast-iron pipes, and specials, stopcocks, and fire hydrants, for the joint water board.—Waterworks Superintendent, Waterworks Engineering Office, 27, Gelliwastad-road, Pontypridd.

HARROGATE.—March 5th.—For the supply at the electricity works of a by-product steam boiler, overhead coal bunker, coal conveyer, and structural steelwork, for the corporation.—Mr. G. Wilkinson, borough electrical engineer, 33 Swan-road, Harrogate.

MANCHESTER.—March 7th.—For the supply and erection of a coal-conveying plant and suction ash plant, for the electricity committee.—Mr. F. E. Hughes, secretary Electricity Department, Town Hall, Manchester.

Mechanically Propelled Vehicles.

MANCHESTER.—February 19th.—For the supply of one or more motor street-sweeping machines, for the Cleansing Committee.—Mr. R. Williamson, superintendent, Cleansing Department, Town Hall.

Roads.

SOUTHAM.—February 19th.—For the supply of about 3,000 tons of granite and 250 tons of best blue broken slag, for the rural district council.—Mr. H. Pickering, surveyor, Pickering, Southam, Warwickshire.

TOWCESTER.—February 19th.—For the supply of granite, for the rural district council.—Mr. W. Sheppard, surveyor, The Workhouse, Towcester.

POOLE.—February 20th.—For the supply of granite and basalt for the corporation.—Mr. S. J. Newman, borough surveyor, Municipal Offices, Poole.

WANSTEAD.—February 21st.—For the supply of cartage and team labour, for the urban district council.—Mr. B. Blewitt, clerk.

BOLSOVER.—February 21st.—For the supply of granite, limestone, slag, basalt, tarred limestone, tarred slag, refined tar, pitch, kerb, channel, sand, and stoneware pipes, for the urban district council.—Mr. J. E. Wardle, town surveyor, Council Offices, Bolsover, near Chesterfield.

SPALDING.—February 21st.—For the supply of granite and slag for the rural district council.—Mr. H. S. Maples, clerk, Spalding.

SALE.—February 21st.—For the supply of flags (including concrete), kerbs, grit setts, macadam, granite chippings, lime and limestone chippings, earthenware pipes, junctions, bends and gullies, for the urban district council.—Mr. W. Holt, engineer and surveyor, Town Hall, Sale.

HODDESDON.—February 21st.—For the execution of street watering for the urban district council.—Mr. W. H. Flood, surveyor, High-street, Hoddesdon, Herts.

ADWICK-LE-STREET.—February 21st.—For scavenging and emptying privy middens, for the urban district council.—Mr. G. Gledhill, surveyor, Council Offices, Adwick-le-Street, Yorks.

KETTERING.—February 22nd.—For the supply of granite, slag, and tar macadam for the rural district council.—The Surveyor, Market-street, Kettering.

WHEATENHURST.—February 22nd.—For the supply of stone and hauling, for the rural district council.—Mr. R. E. Stuart, clerk, Bedford-street, Stroud.

BRIDGNORTH.—February 22nd.—For the supply of granite and slag, for the rural district council.—Mr. F. Richards, surveyor, Council Offices, Bridgnorth.

MARPLE.—February 23rd.—For the supply of granite macadam and chippings, Macclesfield macadam and chippings, 6-in. grit stone setts, and sanitary pipes, for the urban district council.—Mr. D. J. Diver, surveyor, Council Offices, Marple.

DENBIGHSHIRE.—February 24th.—For the supply of roadstone, tar-macadam, and tar-topping, for the county council.—Mr. E. W. Jones, county surveyor, Wrexham.

ROTHERHAM.—February 24th.—For the supply of granite slag and tarred macadam, for the rural district council.—Mr. R. Bradbury, district surveyor, Imperial Buildings, Rotherham.

KEYNSHAM.—February 26th.—For the supply of granite slag, tarred macadam, and limestone, for the rural district council.—Mr. J. Johnson, district surveyor, Surveyor's Office, Keynsham, Somerset.

BREDBURY AND ROMILEY.—February 26th.—For the supply of setts, macadam, and other highway materials, for the urban district council.—Mr. Albert Plunkett, surveyor, Council Offices, Schoolbrow, Romiley.

EAST RETFORD.—February 26th.—For the supply of granite, slag, tar macadam, and refined tar, for the rural district council.—Mr. Thomas Henry, surveyor, Market-square, Retford.

LICHFIELD.—February 26th.—For the supply of granite, slag, chippings, carting, tools, and oils, for the rural district council.—The Surveyor, Council Offices, Station-road, Lichfield.

MARYLEBONE.—February 26th.—For slopping for the year, commencing April 1st, for the borough council.—Mr. J. P. Waddington, borough surveyor, Town Hall, Marylebone, London, W.

LEYTON.—February 27th.—For watering, cartage, and horse hire, for the urban district council.—Mr. L. H. Essex, surveyor, Town Hall, Leyton, Essex.

BARTON-UPON-IRWELL.—February 27th.—For the supply of setts, kerbs, macadam, flags, limestone chipping, sanitary pipes, and road brushes, for the rural district council.—Mr. A. H. Mountain, surveyor, Council Offices, Patricroft, Lancs.

CHESHIRE.—February 28th.—For the supply of macadam, tar-macadam, and chippings, for the county council.—Mr. W. Holland, county surveyor, The Castle, Chester.

CHESHIRE.—February 28th.—For the supply of refined tar, Tarvia, or Tarco, for the county council. —Mr. W. Holland, county surveyor, The Castle, Chester.

CAMBS.—February 28th. For the hire of steam rollers, for the county council.—Mr. H. H. Dunn, acting county surveyor, County Hall, Cambridge.

DISS.—February 28th.—For the supply of 530 tons of 2-in. and 2½-in. granite, 90 tons of 1½-in. and 1¾-in. granite, 70 tons of ¼-in. clean chippings, and 65 tons of ¾-in. dust, for the urban district council.—Mr. Alfred Cooper, surveyor, The Terrace, Diss.

BURNLEY.—February 28th.—For the supply of broken granite, limestone, macadam, shovels, spades, brushes, earthenware pipes, flags, kerbs, channels, grit setts, cast-iron gully grates, and manhole covers, for the rural district council.—Mr. H. Pritchard, surveyor, 18 Nicholas-street, Burnley.

EXETER.—February 28th.—For the construction of 1,000 super. yards of pitch grout macadam road, for the corporation.—Mr. T. Moulding, city engineer and surveyor, Exeter.

EASINGTON.—February 28th.—For making up and paving with slag certain private roads for the rural district council.—Mr. J. G. Heslop, highway surveyor, Castle Eden, Durham.

LONDON.—March 1st.—For the supply of Channel Island granite, Channel Island granite siftings, Farnham gravel, Kentish flints, cockle-shells, red-pit sand, screened Thames sand, and Kentish rag, for the Commissioners of Works.—The secretary, H.M. Office of Works, Storey's-gate, London, S.W.

WARDLE.—March 1st.—For the supply of granite macadam, tar macadam, flags, setts, kerbs, sanitary pipes, brushes, and team labour, for the urban district council.—Mr. J. D. Hurst, clerk, Council Offices, Wardle, Lancs.

BARNSLEY.—March 1st.—For scavenging and bell cart work, for the rural district council.—Mr. D. Thompson, sanitary inspector, 17 Regent-street, Barnsley.

DORCHESTER.—March 2nd. For the repair of the district roads for one year, for the rural district council.—Mr. J. J. Estridge, highway surveyor, Bleak House, Maumbury Way, Dorchester.

BEDWAS AND MACHEN.—March 2nd.—For the supply of ballast, metalling, and lamp oil, for the urban district council.—Mr. A. S. V. Taylor, Council Offices, Bedwas.

DURHAM.—March 3rd.—Tenders are invited for a second-hand No. 1 Smith hot-mixer plant for the making of tar-macadam.—Mr. Albert E. Brookes, county surveyor, Shire Hall, Durham.

SIBSEY.—March 3rd.—For the supply of granite, slag, slag dust and chips, for the rural district council.—Mr. J. M. Simpson, clerk, 28 Wide Bargate, Boston, Lincs.

NEWMARKET.—March 5th.—For the supply of 3,000 tons of 2½-in. best broken Leicestershire granite, 3,750 tons of 1½-in., and 170 tons of granite chippings, for the rural district council.—Mr. F. J. Blackbourn, acting clerk, Deva-chambers, Newmarket.

SUNBURY-ON-THAMES.—March 5th.—For the supply of 500 tons of Guernsey, Clee Hill, Burdon Hill, or Charnwood granite, and 300 tons of slag tar macadam, for the urban district council.—Mr. H. F. Coales, surveyor, Council Offices.

STROOD.—March 7th.—For the supply of Guernsey granite spalls, broken Guernsey and other granites, quartzite, and basalt, Kentish rag, surface-picked and grubbed flints, local pit flints, and dehydrated tar, for the rural district council.—Mr. J. E. Povey, clerk, Council Offices, Stroud.

DURHAM.—March 10th.—For the supply of broken whinstone, broken limestone, broken slag, rough slag, tarred slag, tarred limestone, distilled and prepared tar, tools, team labour, cartage, and sanitary pipes, for the county council.—Mr. A. E. Brookes, county surveyor, Shire Hall, Durham.

WALSALL.—March 13th.—For the supply of broken furnace slag, broken granite, and stoneware pipes, for the rural district council.—Mr. W. P. Young, district surveyor, Council Offices, Daw End, Rushall, Walsall.

CHAILEY.—March 22nd.—For the supply of about 2,980 yds. of flints, 2,550 yds. of granite or other stone, and 60 yds. of gravel, for the rural district council.—Mr. C. Patrick, clerk, Union Offices, West-street, Lewes.

Sanitary.

LEWISHAM.—February 20th.—For the supply of horse hire and removal of house refuse, for the borough council.—Borough Surveyor, Town Hall, Lewisham, London, S.E.

FULHAM.—February 21st.—For the supply of drain pipes and scavengers' brooms, for the borough council.—Mr. J. P. Shuter, town clerk.

WAKEFIELD.—February 26th.—For work of public scavenging, for the rural district council.—Mr. W. Druce, clerk, Tetley House, Wakefield.

SMALLTHORNE.—February 28th.—For scavenging the Packmoor area, for the urban district council.—The Sanitary Inspector, Smallthorne, Staffs.

LLANDAFF.—March 1st.—For the construction of 400 yds. of 9-in. and 18-in. earthenware and cast-iron pipe sewers, with manholes, for the rural district council.—Mr. J. Holden, engineer, Park House, 20 Park-place, Cardiff.

GAINSBOROUGH.—March 3rd.—For the supply of stoneware and earthenware pipes, gullies and cast-iron pipes, for the urban district council.—Mr. S. W. Parker, engineer and surveyor, 6 Lord-street, Gainsborough.

CAERPHILLY.—March 20th.—For scavenging various districts, for the urban district council.—Mr. T. H. Richards, surveyor.

Stores.

BETHNAL GREEN.—February 19th.—For the execution of works and the supply of ballast, sand, broomheads, disinfectants, horse hire, and ironmongery, for the borough council.—Mr. A. E. Darby, borough engineer and surveyor, Town Hall, Cambridge-road, Bethnal Green, E.

DONCASTER.—February 19th.—For the supply of roadstone and setts, kerbstone, flags, slag or furnace dross, tarred slag and limestone, pitch, creosote oil and refined tar, sand and gravel, drainage pipes, blue channel bricks, bricks, cement, brooms, paints, picks and shovels, oils, paraffin, cotton wastes, and disinfectants, for the corporation.—Mr. R. E. Ford, acting borough surveyor, Mansion House, Doncaster.

WIGAN.—February 21st.—For the supply of brooms and brushes, Portland cement and lime, common bricks, stoneware pipes and gullies, pitch, creosote oil, tar, manhole and gully grates, oils, paints, grit, setts, kerbstones, channel stones, flags, gravel, chippings, macadam, granite setts, kerbs, channels and crossings, floorcloths and dusters, for the corporation.—Mr. A. T. Gooseman, borough engineer and surveyor, Municipal Offices, King-street West, Wigan.

LLANDAFF AND DINAS POWIS.—February 25th.—For the supply of mountain limestone, team labour, Clee Hill stone, tools, castings, ironmongery, earthenware pipes, and street watering for the rural district council.—Mr. James Holden, surveyor, 20, Park-place, Cardiff.

MALDENS AND COOMBE.—February 26th.—For the supply of broken flints, granite, fine gravel, tar-macadam, tar paving, Portland cement, brooms, brushes, manhole covers, gully gratings, pitch, creosote oil, distilled tar, paints, colours, leads, varnishes, oils, and sundries, for the urban district council.—Mr. James W. Johnson, clerk, Council Offices, New Malden, Surrey.

WHITEFIELD.—February 26th.—For the supply of granite macadam, setts, chippings, kerbs, flags, disinfectants, earthenware pipes, and ironwork, for the urban district council.—Mr. G. M. Denton, engineer and surveyor, Whitefield.

CLITHEROE.—March 3rd.—For the supply of wrought iron, steam tubes and fittings, ironmongery, lime, team labour, disinfectants, limestone, earthenware pipes, street gates, brushes, mortar, granite, flags, setts, pitch, and oil, for the corporation.—The Borough Surveyor.

SOUTH SHIELDS.—March 3rd. For the supply of Northumberland whinstone, Fifeshire whinstone, Aberdeen and Norwegian granite, slag, granite chippings, Caithness flags, Portland cement, cement concrete flags, cast ironwork, shovels, scavenger brooms and machine brooms, coal, coke, disinfectants, leather hose, sewer boots, jackets, sanitary pipes, paints, paint oils, glass, timber, iron, horseshoe nails, cart axles, springs, tar, pitch, oils, and general stores, for the corporation.—The Borough Engineer, Municipal Buildings, South Shields.

COLCHESTER.—March 7th. For the supply of Derbyshire stone, lime, granite kerbing, granite setts, broken granite, Kettering iron slag, tar-macadam, broken Kentish ragstone, Kentish sifted red flints, Portland cement, glazed stoneware sewer pipes, junctions, bends, traps, taper pipes and gullies, for the corporation.—Mr. H. Collins, borough engineer and surveyor, Town Hall, Colchester.

DURHAM.—March 10th.—For the supply of broken whinstone, broken limestone, broken slag, rough slag, tarred slag, tarred limestone, distilled and prepared tar, tools, team labour and cartage, and sanitary pipes, for the county council.—Mr. Albert E. Brookes, county surveyor, Shire Hall, Durham.

HEYWOOD.—March 17th.—For the supply of setts, kerbs (local stone), flags (local stone), earthenware pipes, bends, junctions, taper pipes, traps, gullies, pitch, creosote oil, limestone chippings (white), hand-broken granite and granite chippings, and Portland cement (British standard specification) for the corporation.—Mr. J. B. Nuttall, borough surveyor, Municipal Offices, Heywood.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

* Accepted. † Recommended for acceptance.

CAISTOR.—For the supply of about 5,000 tons of granite, about 5,400 tons of slag, about 550 tons of slag chips, and 200 tons of tar-macadam, for the rural district council.—Mr. J. Surfleet, district surveyor:—

GRANITE.

Ellis & Everard, Bardon Hall; M. Jackson & Son, Louth; Ord & Maddison, Darlington; Mountsorrel Granite Company, Mountsorrel, from 14s. to 15s. 6d. per ton at different stations.

SLAG.

Atkinson & Sons, North Kelsey, 6s. 4d. to 7s. 6d. per ton.

TAR-MACADAM.

Atkinson & Sons, North Kelsey, 14s. 7d. to 15s. 7d. per ton.

CANNOCK.—For tars-spraying and the supply of refined tar, for the urban district council.—Mr. R. Blanchard, engineer and surveyor:—

Tars-spraying.—W. Bullock, Stoke-on-Trent.
Refined Tar.—Kempson & Co., Limited, Alfreton.

DERBY.—The following tenders have been accepted:

Steam Turbine, Alternator, and Condensing Plant.—C. A. Parsons, Limited, Newcastle-on-Tyne, £12,600.
Boiler Plant.—Babcock & Wilcox, Limited, London, £6,513.
Buckets and Elevators.—Chain Belt Engineering Company, and Eastwood & Swingler, Limited, £2,500.

EASINGWOLD.—For the supply of whinstone and slag, for the rural district council:—

G. Hodgman & Sons, Limited, York
Cranlock, Allison & Co., Eaglescliffe.
Ord and Maddison, Limited, Darlington.
Monkhouse & Peart, Wearhead
F. Summerson & Co., Darlington
J. L. Smith & Co., Leeds
W. C. Clarke, Limited, Darlington.
Slag and Tar Macadam Company, Limited, Darlington
J. F. Shackleton & Co., Goole.

GRAYS THURROCK.—For the supply of 400 tons, or thereabouts, of basalt or granite chippings, for the urban district council.—Mr. A. C. James, surveyor:—

	Per ton. £ s. d
Brooks, Limited, Westminster	1 0 0
Lancaster & Bateman, Sutton Bridge	0 13 3
Ludgate and Stones, Stanton Granite Company, Ludgate	0 12 8

LEATHERHEAD.—For the supply of about 400 barrels of refined tar for the urban district council.—Mr. Sidney R. Drake, surveyor:—

TAR.

	Per gallon d.
Georgelee & Co., London	3½
F. G. Holmes & Co., Sandhurst, Kent	4¼
Gas Light and Coke Company, London	3¾
Forbes, Abbott & Lemon, Limited, Shoreham, Sussex	3½
E. Cockbeck & Sons, London	3
Leatherhead Gas Company, Leatherhead †	3½

COATING.

Hall & Co., Epsom (per ton)	7 0
Farnham Gravel Company, Farnham, Surrey (per ton)	5 10
T. Patterson, Farnham, Surrey (per ton)	4 10

LITTLEHAMPTON.—Accepted for the supply of 14,000 gallons of tar, for the urban district council:—

Road Supply Company, 3 11/16d. per gallon.

NORFOLK.—For the supply of various articles, for the Eastern Highways Committee.—Mr. W. W. Gladwell, county surveyor:—

Tools.—Bird & Co., West Drayton; E. Langford, King's Lynn; W. R. Pollard, East Harling.
Gully Grates and Frames.—Youngs & Co., Diss.
Roadmen's Barrows.—Smith & Co., Besthorpe; C. W. Clarke, Fakenham.
Navvy Barrows.—C. W. Clarke, Fakenham; W. S. Walker, Grimston.
Hand Carts.—R. A. Dodman, North Walsham; W. S. Walker, Grimston; C. W. Clarke, Fakenham.

FORTHCOMING MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

FEBRUARY.

16.—Institution of Municipal and County Engineers: South-Eastern District Meeting. 92 Victoria-street, Westminster. 4 p.m.

16.—Institution of Mechanical Engineers: Annual General Meeting, Institution of Civil Engineers, 6 p.m.

19.—Junior Institution of Engineers: Mr. R. D. West on "Some Improvements in Dealing with Trade Wastes." 7.30 p.m.

24.—Institution of Municipal and County Engineers: South Wales District Meeting at Neath.

MARCH.

23.—Town Planning Institute: Mr. W. Rees Jeffreys on "Road Construction and Improvements by Means of Town Planning Schemes." 6 p.m.

TENDERS WANTED.

CAMBRIDGESHIRE COUNTY COUNCIL.

TENDERS FOR STEAM ROLLING.

The above Council invite Tenders for the Hire of Steam Rollers for use on the main roads during the year ending March 31, 1917.

Particulars and Forms of Tender may be obtained from, and Tenders are to be delivered on or before year ending March 31, 1917.

H. H. DUNN,
Acting County Surveyor.

County Hall, Cambridge. (3,310)

ROAD MATERIALS.

The Commissioners of H.M. Works, &c., are prepared to receive Tenders for the Supply of Road Materials (Channel Island Granite, Channel Island Granite Siftings, Screened, Pea and Farnham Gravel, Kentish Flints, Cockle Shells, Red Pit Sand, Screened Thames Sand and Kentish Rag) during a period of one year from the 1st April, 1917.

Forms of Tender and all particulars may be obtained on application at the undermentioned address.

Tenders may be submitted for all the materials or for one or more kinds to be supplied at one or more of the depots.

The Commissioners do not bind themselves to accept the lowest or any Tender.

Tenders must be delivered before 11 a.m. on Thursday, the 1st March, 1917, addressed to the Secretary, H.M. Office of Works, Storey's Gate, London, S.W., and endorsed "Tender for Road Materials."

H.M. Office of Works, &c.,
13th February, 1917. (3,311)

APPOINTMENTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

SHEFFIELD CORPORATION WATER DEPARTMENT.

EWDEN VALLEY WORKS.

Storekeeper wanted at once. Practical experience on public works essential. Must be over military age. Apply, stating age, experience, and wages required.

WILLIAM TERREY,
General Manager, Water Department.

Town Hall, Sheffield. (3,299)

The Surveyor

And Municipal and County Engineer.

Vol. LI. FEBRUARY 23, 1917. No. 1,310.

Minutes of Proceedings.

The Vesting of Streets in Urban Districts.

It is a curious fact that the simplest expression in an Act of Parliament will sometimes give rise to complicated questions. An apt illustration is to be found in sec. 149 of the Public Health Act, 1875, which, it will be remembered, provides that all streets being, or which at any time become, highways repairable by the inhabitants at large within any urban district shall "vest in" and be under the control of the urban authority. It appears to have been assumed at first that the effect of this enactment was to make the urban authority the absolute owners of the soil of the public streets within their district, with the ordinary rights incidental to the ownership of the soil of a public highway. It is well established that a landowner who dedicates part of his land to the public as a highway retains all rights which are not inconsistent with the public right of passage. He may, for instance, deal with the subsoil in any manner which does not interfere with the use of the land for the purpose of a highway, and he is entitled to the space above it (in the quaint old phrase, *usque ad cælum*), and can prevent anyone from carrying telegraph or telephone wires across it without his consent. But as soon as urban authorities, assuming that they possessed similar rights with respect to streets "vested" in them by the statute, began to act accordingly, litigation ensued, with the result that the courts, interpreting the expression "vest" in a much more restricted sense, rejected this assumption as unwarranted. With regard to the subsoil, it has been decided that the urban authority cannot legally construct lavatories or subways under a street (*Tunbridge Wells Corporation* v. *Baird*, [1896], A.C., 434; *London and North Western Railway Company* v. *Westminster Corporation*, [1904], 1 Ch., 759); nor can they grant a licence to traders to lay pipes for trading purposes (*Salt Union, Limited*, v. *Harvey*, [1897], 13 T.L.R., 297); nor do they acquire any right to minerals below the street. And even where an electric lighting company illegally broke up a street and laid wires about 2 ft. below the surface, the court refused to grant a mandatory injunction to compel their removal (*Battersea Vestry* v. *County of London, &c., Electric Lighting Company*, 1899, 1 Ch., 474). And as to the space above the street, although the urban authority have the right themselves to erect posts in, and to carry electric wires across, the street for the purpose of lighting their district (*Fareham Local Board* v. *Smith*, 1891, 7 T.L.R., 443), they cannot prevent telephone or telegraph companies from carrying wires across it, provided they are at such a height as to cause no appreciable danger to the traffic (*Wandsworth Board of Works* v. *United Telephone Company*, 1884, 13 Q.B.D., 904; *Finchley Electric Light Company* v. *Finchley Urban District Council*, 1903, 1 Ch., 437).

What then is the effect of the provision that the streets shall "vest in" the urban authority? Perhaps it cannot be expressed more tersely than in the following *dictum* of Lord Herschell in the Tunbridge Wells case: "It seems to me that the vesting of the street vests in the urban authority such property, and such property only, as is necessary for the control, protection, and maintenance of the street as a highway for public use." It has been put in more amplified forms in other judicial *dicta*, by collating which it appears that what is vested in the authority is what is called "the user of user"—*i.e.*, the surface of the street and so much of the subsoil and of the stratum of air above the surface as can, in any reasonable sense, be required for the purposes of the street, and considered as essential to the purposes referred to by Lord Herschell. It is true that his interpretation does not altogether shut the door upon the possibility of disputes, since cases may still arise in which opinions will differ as to what is and what is not "reasonable" or "essential." Such cases, however, will probably be rare.

* * *

Highways and Byways.

At the last meeting of the Royal Society of Arts, Mr. Lawrence W. Chubb read a paper of great interest on the subject of "Highways and Byways," with special reference to the work of the Commons and Footpaths Preservation Society, of which he is the secretary. The earlier part of the paper consisted of a statement of the main principles of the law in regard to dedication, and an account of the origin and development of our present system of highway administration. All this, however, was introductory to the main theme—namely, the protection of public rights of way (and particularly from whist from obstruction. Our readers are, of course, familiar with the principle that when once a [illegible] has been dedicated to the public it cannot lawfully be closed by Act of Parliament or by an Order of the justices made under the Highways Act, 1835. Long experience has shown however that illegal obstructions usually be [illegible] use of common prudence. These infringements of the public right can be combated in two ways, namely, by action

[illegible] part of a highway authority under [illegible] 20 of the Local Government Act, 1894, to [illegible] section of the public [illegible] one or more individuals [illegible] The Commons and Footpaths Preservation Society has a long and honourable record of work in assisting in both these directions, and as the result of its experience has met with almost every form of difficulty which can retard the growth of an effective association of public [illegible]. Chief among these difficulties is undoubtedly the [illegible] of legal proof of the right in view of the present state of the law as to dedication, and the conflicting views taken by different judges in cases raising similar questions of fact. The law as to implied dedication does not rest upon any prescriptive title acquired by the public after a definite period of user. On the contrary, any period of user is sufficient, so long as in all the circumstances it is sufficient to enable a judge or jury to infer from it an intention to dedicate. Apart from the rule that there can, generally speaking, be no dedication except by a freehold owner often operates very hardly as against the public, for if it can be shown that for the whole period of public user, no matter how long it may have been, the land over which an alleged highway passes has been in strict settlement, no dedication can be implied during that period. Many judges have felt themselves to be rigidly bound by this rule, while [illegible] others, however, have got over the difficulty by presuming dedication [illegible] period of settlement. This want of uniformity is very deplorable, and there is little doubt that the uncertainty thereby created has prevented many an attempt to establish a public [illegible] which might otherwise have been made.

It is not surprising, therefore, that there is a widespread feeling among those who are chiefly interested that the proof of public rights of way should be placed upon a more equitable and sure basis. For some years past the Commons and Footpaths Preservation Society has been pressing for the passage through Parliament of a Bill which provides that, where an estate is in the hands of an actual freeholder, open and notorious public user as a path for twenty years shall be sufficient to raise the presumption of dedication. If, however, the land is entailed, or subject to any other restrictive disposition, it is proposed that the period of user shall be forty years. The Bill has met with little opposition and has passed through the House of Lords in the Legislature on more than one occasion. Up to the present, however, it has not succeeded in passing both Houses in the same session and so has never become law. We join in the hope expressed by Mr. Chamb[illegible] that, with the return of more normal times, Government facilities may be given for the passing into law of a measure on the lines indicated.

* * *

Edinburgh Water Trustees and the Aggrieved Plumbers.

That municipal trading has a [illegible] both as regards financial aspect and responsibility has just been illustrated in a case that was heard recently in the Scottish Court of Session. Certain master plumbers in Edinburgh brought the action to have it declared that the Edinburgh and District Water Trustees were not entitled to engage in the trade or business of plumbing and in particular, either by themselves or their agents, were not entitled to furnish, or to contract to furnish any pipes or other articles connected with the supply of water to the dwelling-houses or premises within the district of the Trustees. It appeared that the Trustees were requested by the military authorities to provide a water supply to huts erected on the Castle Esplanade for the accommodation of troops. In connection with the work [illegible] the War Office [illegible] for the execution of the whole plumbing work, this being, of course, work ordinarily performed by plumbers. The defence was that the work was done at the order of the War Office in the national interest, and that in respect of the Defence of the Realm Regulations the pursuers (plaintiffs) were not entitled to the interdict sought for. The decision of Lord Ormidale left no room for doubt with respect to the legal rights or wrongs of the point at issue, though it is clear that his lordship entertained the opinion that morally the trustees were justified in what they had done. With the exception of houses of an annual value not exceeding £10, the trustees, it was laid down, neither explicitly nor inferentially were entitled to engage in ordinary and original or initial plumbing work at or inside the premises which were being supplied with water. The powers of the trustees, moreover, were not to any extent enlarged by the provisions of the Defence of the Realm Regulations. Their duty concluded when they brought the water up to the premises, "and they could not, as an authority supplying water, be compelled or agree to provide and fit the apparatus necessary for its distribution and disposal within the premises." His lordship sympathised with the view that such work could be done by the trustees with greater dispatch and convenience to the military authorities than by any one else, "and it was to be regretted that in existing circumstances the pursuers should have deemed it expedient to take exception on technical grounds to work which appeared to have been in the public interest, and without any possibility of material detriment to the interests of the pursuers either in the present or in the future.

It would seem that the trustees interpreted their duty in the imperial and imperative sense, and if so they will receive the sympathy of the ordinary citizen, to whom expedition and public convenience would appeal strongly in these abnormal times. Technically, however, they are placed out of court, and must, of course, bear the consequences.

* * *

L.C.C. Tramways Reorganisation.

At the last meeting of the London County Council some very remarkable figures were given in regard to the development of the tramway undertaking since the first complete year—1871, the year ending March 31, 1900. Between that date and March 31, 1914, the track mileage had increased from 24 miles to rather over 144; the number of car miles run had increased fivefold; the number of passengers carried annually had reached the colossal total of 523,000,000; and the annual revenue had reached a total considerably in excess of £2,250,000 sterling. These figures were stated in a report of the Highways Committee, in which specific proposals were put forward for a reorganisation of the department. The present organisation, it was pointed out, had grown naturally with successive additions to the system, and the necessity for some review had become manifest in consequence of the growth in working costs and the increasing complexity of Metropolitan passenger traffic operations. The principle recommended by the committee for reorganisation was that of devolution, and, in view of the magnitude of the undertaking, this certainly seems to be the right line to take. Hitherto the chief officer has been compelled to devote much time and attention to ordinary executive business, while the division of the department into ten sections has also rendered necessary great efforts in co-ordination. For these reasons he has been hampered in dealing with such important matters as the development and improvement of the system, and the consideration of larger questions of tramway working and policy. Under the proposed new scheme the department will be

divided into five branches—viz.: (1) Traffic branch; (2) electrical branch; (3) rolling-stock branch; (4) permanent way branch; (5) general branch, and the devolution by the chief officer of tramways of duties and responsibilities to the higher subordinate officers upon general lines will thus become possible. The reorganisation will involve a number of new appointments, particulars of which will be found in another column. Criticism will no doubt be made in certain quarters that the salaries to be paid are excessive, but in view of the magnitude of the interests that are involved and the responsible nature of the duties to be discharged, we are confident that the line of true economy lies in attracting the best men available.

* * *

Municipal Officers and Military Service.

It appears from enquiries that we continue to receive that the question of the exemption of certain members of the staffs of officers of local authorities from military service is still the subject of some doubt in the minds of those concerned. As an example of the kind of question that is being asked, we may perhaps mention the following, which was put to us: An official holding the joint appointments of engineer and sanitary inspector had a staff before the war of three assistants; two of these joined the Colours in 1914, and the remaining one has, up to the present, been the subject of conditional exemption. He has now, however, been given a final two months, at the expiration of which he will have to join up. It is pointed out to us in this case that in the official list of certified occupations appears an entry "officials on the administrative or technical staffs of Local Government authorities." As we pointed out, however, some time ago, the entry in the list of certified occupations to which we have just referred is qualified by a statement that only those men to whose reservation the military representative agrees are to be treated as in a certified occupation. Further, from a circular of instructions which was issued in March of last year for the guidance of tribunals, it is clear that "administrative staff" is intended to include persons holding responsible administrative positions (not, for instance, ordinary clerks), and "technical staff" is intended to include officials such as surveyors who hold their positions in virtue of definite professional qualifications.

* * *

The Orphan Fund.

It appears from the letter which has been addressed by Mr. O. Claude Robson to the district secretaries that the Orphan Fund Committee of the Institution of Municipal and County Engineers has had under consideration the question of devolution with a view to securing a more widespread interest in the fund and an increase in the number of subscribers. The subject was broached by Mr. Massie at the annual meeting at Blackpool, when it was felt that some strenuous effort should be made to render the fund more worthy of the association by endeavouring to secure the sympathy and assistance of the various districts by utilising the machinery of the district committees for the purpose of increasing the number of subscribers to the fund. The Orphan Fund Committee have now decided that one or more Orphan Fund stewards be appointed in each district to advocate the claims of the fund, to promulgate its work, to solicit and collect subscriptions and donations, to investigate cases needing assistance, and to report to the secretary on all questions relating to the work of the fund. There can be little doubt that, as a result of the war, the demands on the fund will be greater than ever, and we sincerely hope that the new method of working will secure the desired results. At last Friday's South-Eastern District meeting it was suggested that a subscription might be given from the funds of the institution. If the funds would permit, this might be a desirable course, but we cannot help thinking that there might be some legal technical difficulty to prevent such a contribution being made.

* * *

A Surveyor's Salary.

At a recent meeting of the Godmanchester Urban District Council a letter was read from the surveyor applying for some temporary addition to his salary on the ground that, owing to the increased cost of living, the remuneration is not now sufficient for his needs. Upon the application a general discussion ensued, which illustrated very well the views which are taken by different types of members of local authorities upon a question of this kind. More than one member took the view that in making his application the surveyor was trying to obtain some advantage for himself at the expense of members of the community who were probably worse off. Another view that was expressed was that every one ought to feel the war, and that the surveyor would only be "doing his bit" if he withdrew his application. It is a relief to find that one member at least took a broader view of the situation, and expressed surprise that similar applications had not been received long before, not only from the surveyor, but also from other officials. For our part, we can never understand upon what ground a bonus is granted, usually without question, to workmen in receipt of a weekly wage, when as soon as an official receiving very little, if any, more ventures to ask for consideration, a storm of protest is immediately raised. In the case of which we have been speaking, not only was the application refused, but objection was taken by the member who moved the refusal to the surveyor making a statement in support of his application. The whole proceeding is hardly creditable to the authority concerned.

* * *

The Shortage of Labour.

There can be no doubt that at the present moment many of the highways in this country are suffering severely from the present shortage of labour and difficulty in obtaining material. A case in point arose recently at Shepton Mallet. At the last meeting of the rural district council the surveyor had to report that he had been unable to obtain the stone necessary for carrying out certain main road repairs, owing to the fact that the whole of the output of the local quarries was being commandeered by the War Office. Arising out of the surveyor's report on the subject, there was a general discussion, which was not without interest. Various complaints appear to have been made about the condition of the roads, and, in spite of the acknowledged difficulty in obtaining labour and material, an attempt was made to fix some blame upon the surveyor, on the ground that the roadmen ought to have more supervision. To this the very pertinent reply was made that in present circumstances it was physically impossible for the surveyor to do more work than he was doing, but that if he were provided with a motor much of the difficulty would be removed. Ultimately a special sub-committee was appointed to carry out an inspection of the roads, but it is a little difficult to see what practical result can flow from their labours unless they can make some suggestions for obtaining more readily than at present the necessary labour and material for the efficient maintenance of the roads in the district.

c*

Standard Specifications for Road Materials.

CRUSHED STONE, SAND, GRAVEL AND ASPHALTIC OILS.

[A committee of the Canadian Society of Civil Engineers consisting of Messrs. W. A. McLean (chairman), W. P. Brereton, F. W. Doane, Jules Duchastel, J. E. Griffith, G. Henry, Edgar James, A. F. Macallum, A. J. McPherson, Paul Mercier, W. P. Near, George Powell and C. H. Rust, have been engaged in collecting data concerning the construction of various types of roads and streets, and formulating tentative standard specifications for the guidance of engineers in the purchase of road materials. Appended is an abstract of the committee's draft of proposed specifications for crushed stone, sand, gravel and asphaltic road oils.]

The formulating of specifications for natural products such as crushed stone, gravel, and sand, which can be directly used in all localities, is impossible. In many localities the greater portion of the cost of these materials is that paid for transportation. Hence material of high quality which can be procured within short distance of the work in one locality would reach a prohibitive cost in another.

The committee has therefore endeavoured to draw up specifications which cover materials of good quality under normal commercial and natural conditions. It is recognised that in some districts these specifications as they stand will not be applicable, but the ideal striven for has been to secure a specification that may be a guide, from which specifications best suited to local conditions can be drafted.

The classifying of materials into different grades according to qualities reduces the necessity of redrafting the specifications. In localities where materials of certain grades cannot be secured economically and the nature of the work permits the use of material of inferior qualities, it will only be necessary to specify the particular grade required when the specifications for work are drafted.

The extensive use of laboratory test results may be considered inadvisable by some engineers. At the present time laboratories are not available in all municipalities, but resort to laboratory tests is rapidly growing and even at the present time tests are being conducted by some of the universities in the Dominion. It is felt that it is only a matter of time till every large municipality will submit all materials to laboratory test prior to accepting them.

The properties assigned to the different grades have been selected from the study of results of tests made under the direction of the chairman of the committee as well as from the study of the results of tests conducted by various highway organisations.

In reading the specifications it must be borne in mind that tests are for the supply of materials only. The classes of work in which the materials are to be used (unless such materials are confined only to such classes of work) are not here stated. The specifications for the construction of various types of pavements will state definitely the class, size, &c., of the materials which are to enter into the construction of the pavement.

Drafts of the specifications as considered by the members of the committee residing in Toronto were sent to all members. Where suggestions regarding changes in certain points were made these have been incorporated, but where changes of importance have been suggested these are indicated at the end of each specification in order that they may receive the consideration of the society.

The committee reports progress in the drafting of specifications for the supply of bituminous materials. The rapidly increasing use of these materials for the protection of road surfaces renders it advisable that a suitable specification be in the hands of engineers at the earliest moment.

Work has commenced on three grades of a penetration road oil, but at the same time it was realised that some work should be done on other grades of this material as well as on refined tars, &c., favoured by engineers for certain classes of work. Specifications for bituminous materials have not been issued, as it is felt by all the members of the committee, and so therefore to be considered as a provisional report only.

It is the intention of the committee that a series of annual reports be drawn up which will take into consideration the various types of pavements suggested, systems of payment and methods of inspection of materials. Following are the proposed tentative specifications:

CRUSHED STONE.

Definition.—1-1.—Crushed stone shall be bedded rock or boulders which have been broken by mechanical means into fragments of varying shapes and sizes. It shall not contain more than 10 per cent by weight of soft or friable material. Material of which the particles are coated with dirt or have the edges worn off will not be accepted.

Weathered Stone.—1-2. No crushed stone shall be accepted which shows signs of being disintegrated or reduced in quality by the action of the weather.

Crusher Run.—1-3. Crusher run shall be the product of the crusher, of which not more than 8 per cent by weight shall pass at ¼-inch opening.

Sizes of Stone.—1-4. The following schedule of sizes shall be used, with the percentages of material larger than the maximum and smaller than the minimum openings respectively, as shown. The sizes of opening shall mean the diameter of circular openings in steel or iron plates. The percentages shall be determined by weight.

The sizes of stone with the openings by which they are obtained are as follows:—

Name of size.	Max. size of opening in inches.	Max. % retained by max. size of opening.	Min. size of opening in inches.	Max. % passing minimum size of opening.
5 inch	5	3	4	8
4 „	4	3	3	8
3 „	3	3	2½	8
2½ „	2½	5	2	10
2 „	2	5	1½	10
1½ „	1½	5	1	15
1 „	1	5	½	15
½ „	½	7	¼	15

Screenings.—Screenings shall be material all of which shall pass a ¼-inch screen.

Mineral Dust.—Mineral dust shall be finely pulverised stone of which not less than 80 per cent by weight shall pass a 200-mesh screen.

Tests on Stone.—1-5. In addition to fulfilling the foregoing requirements, crushed stone shall be classed into three grades, according to qualities which shall be determined by tests conducted in a properly-equipped laboratory. The properties determined shall be: Co-efficient of wear, toughness and absorption. Material meeting the requirements of any of the grades with respect to coefficient of wear and toughness, but failing to meet the requirement with respect to absorption may, on consideration of the engineer, be classed with the higher grade.

Grades of Crushed Stone.—Crushed stone shall be classed under one of the following grades:

1-6.—Grade "A" is a rock which has a toughness of not less than 18, a coefficient of wear of not less than 14, and an absorption of not more than 0·6 pound per cubic foot.

1-7.—Grade "B" is a rock which has a toughness of not less than 10, a coefficient of wear of not less than 7, and an absorption of not more than 1·5 pounds per cubic foot.

1-8.—Grade "C" is a rock which has a toughness of not less than 7, a coefficient of wear of not less than 5, and an absorption of not more than 4·5 pounds per cubic foot.

1-9.—Grade "D" is a rock that does not meet the requirements of any of the above grades and which may be used only on consideration by the engineer.

GRAVEL.

Definition.—2-1. Gravel shall consist of naturally formed fragments of tough durable rock, well graded in size from the smallest to the largest, free from flat, elongated particles, and shall not contain more than 15 per cent by weight of soft friable material. It shall not contain an excess of clay nor

an excess of loose or adhering dust, vegetable loam or other deleterious matter. It shall be satisfactory to the engineer in all respects.

Screened Gravel.—2-2.—"Screened gravel" is gravel fulfilling the above requirements, which is screened into one or more of the sizes defined in Section 1-4 of the "Specifications for Crushed Stone."

2-3.—"Run of bank gravel" is gravel fulfilling the requirements of Section 2-1 of this specification, which shall be classed under one of the three grades shown below according to qualities determined in a properly-equipped laboratory. The properties determined shall be the coefficient of wear and the proportions of the various sizes of particles present.

The coefficient of wear shall be determined on material passing a screen having circular openings 2 in. in diameter and retained by a screen having circular opening ½ in. in diameter. The test shall be conducted in the same manner as that for determining the coefficient of wear of crushed stone. Run of bank gravel shall be classed according to the following grades:—

2-4.—Grade "A" is a run of bank gravel containing a large percentage of pebbles of igneous rocks. It shall not contain more than 5 per cent by weight of material which shall be retained on a screen having 4-in. circular openings, and not more than 45 per cent by weight of material, which shall pass a screen having ¼-in. square openings. It shall not contain more than 3 per cent by weight of clay or loam nor have a coefficient of wear of less than 14.

2-5.—Grade "B" is a run of bank gravel containing a smaller percentage of igneous rock pebbles. It shall not contain more than 5 per cent by weight of material which is retained by a screen having 4-inch circular openings nor more than 60 per cent by weight of material retained by a screen having ¼-in. square openings. It shall not contain more than 9 per cent by weight of clay or loam nor have a coefficient of wear of less than 11.

2-6.—Grade "C" is a run of bank gravel composed chiefly of pebbles of sedimentary rock. It shall not contain more than 5 per cent by weight of material which is retained on a screen having 4-in. circular openings, and not more than 80 per cent by weight of material which passes a screen having ¼-in. square openings. It shall not contain more than 12 per cent by weight of clay or loam nor have a coefficient of wear of less than 7.

2-7.—Grade "D" is a run of bank gravel which does not meet the requirements of any of the above grades, and which may be used only by written permission of the engineer.

2-8.—When so directed by the engineer, gravel shall be crushed. The material so produced shall conform to the requirements of "screened gravel" or "Run of bank gravel" as directed by the engineer.

SAND.

Concrete Sand.—3-1. Fine aggregate for concrete shall consist of natural sand, composed of hard, tough, durable particles, graded from fine to coarse. When dry, not more than 5 per cent shall be retained on a sieve having 4 meshes per lineal inch; not more than 20 per cent by weight shall pass a sieve having 50 meshes per lineal inch, and not more than 4 per cent shall pass a sieve having 100 meshes per lineal inch. It shall not contain more than 3 per cent by weight of clay or loam.

Mortar Tests.—3-2. Sand in addition to meeting the above requirements shall give a mortar strength equal to or higher than the minimum value at any of the ages shown in the following table:

Age at test.	Minimum strength of 1:3 mortar.
72 hours	1·25 times A
7 days	1·10 times A
28 days	1·00 times A

Where "A" is the strength of 1:3 standard Ottawa sand mortar specimens of same form and size made by the same operator using the same cement and the same amount of water.

The tests shall be made on mortars composed of one part Portland cement and three parts of fine aggregate or standard Ottawa sand by weight. The test specimens shall be made, stored and tested in the same manner, under approved laboratory conditions and according to recognised standards of practice. Each value shall be the average from tests of no fewer than three specimens.

Cement.—3-3. The cement used in all tests shall meet the requirements of the specifications for Portland cement of the Canadian Society of Civil Engineers, as revised in 1916.

Stone Screenings.—3-4.—Stone screenings from a hard, tough, durable rock may be used as fine aggregate by written permission of the engineer and provided it meets the requirements of mortar strength.

Sand for Bituminous Construction.—3-5.—Sand for use in bituminous pavement construction shall consist of hard, tough, durable particles. It shall not contain more than 1 per cent of clay or loam. When dry, not more than 8 per cent shall be retained on a sieve having eight meshes per lineal inch, and shall not vary more than 5 per cent from the following:—

Screen mesh per lineal inch.	Percentage by weight retained.
8	10
30	20
50	27
80	20
100	15
200	7
	1
	100 pass.

Cushion Sand.—3-6.—Cushion sand shall be clean and sharp, and not more than 10 per cent by weight shall be retained on an 8-mesh sieve. It shall not contain more than 10 per cent by weight of clay or loam.

Grout Sand.—3-7.—Grout sand shall be clean, sharp and well graded. Not more than 8 per cent by weight shall be retained on a 20-mesh sieve, and not more than 30 per cent on a 100-mesh sieve. It shall not contain more than 5 per cent of clay or loam.

Mortar made in the proportion of 1 part of cement to 3 parts of sand by weight shall show a tensile strength at least equal to 40 per cent of a similar mortar made of standard Ottawa sand, mixed in the same proportions and stored and tested in the same manner.

ASPHALTIC ROAD OILS.

General.—Asphaltic oils shall be classed into three grades, each containing the minimum percentage by weight of asphalt, of 50 deg. penetration, as follows:—

Light oil shall not contain less than 40 per centum asphalt.

Medium oil shall not contain less than 60 per centum asphalt.

Heavy oil shall not contain less than 80 per centum asphalt.

All oil, in addition to meeting the requirements of one of the above grades, shall have the following characteristics as determined in the laboratory. All tests shall be conducted according to the latest methods recommended by the American Society for Testing Materials.

The requirements are as follows:—

1. It shall be obtained by the refining of asphaltic or semi-asphaltic petroleum or by the combination of solid or semi-solid native asphalts with asphaltic petroleums or derivatives thereof, which melt on the application of heat.

2. The various hydrocarbons composing it shall be present in a homogeneous solution.

3. It shall be free from water and sediment.

4. It shall not contain acid nor sulphur in sufficiently large quantities to attack rubber or rubber compositions.

Light Oil.—Light oil shall have the following characteristics:—

1. It shall have a specific gravity of not less than 0·92 at 77 deg. Fahr. (25 degrees C.).

2. When evaporated in an open vessel at a temperature between 450 and 500 deg. Fahr. until the residue remaining has a penetration (5 seconds, 77 deg. Fahr., No. 2 needle, 100 grams) of 50 degs., the residue shall meet the following requirements:—

(a) It shall amount to not less than 40 per centum and not more than 50 per centum of the original oil by weight.

(b) It shall have a ductility at 77 deg. Fahr. of not less than 25 centimetres (Dow mould).

(c) It shall have a melting point of not more than 160 deg. Fahr. and not less than 130 deg. Fahr. when tested by the ball and ring method.

3. Fifty grams of the oil upon being maintained at a temperature of 325 deg. Fahr. for five hours in a cylindrical vessel 2½ in. in diameter and 1½ in. deep

shall not lose more than 25 per centum nor less than 10 per centum by weight.

4. It shall be soluble at air temperature in pure carbon bisulphide to the extent of not less than 99·0 per centum.

5. It shall be soluble at air temperature in 76 deg. Beaume paraffin petroleum naphtha distilling between 140 and 190 deg. Fahr. to the extent of not less than 80 per centum and not more than 95 per centum.

6. It shall yield not more than 8 per centum by weight of fixed carbon on ignition.

7. It shall show a flash point of not less than 120 deg. Fahr. when tested in an open cup.

8. It shall not contain more than 5 per centum by weight of paraffin scale.

MEDIUM OIL.—Medium oil shall have the following characteristics:—

1. It shall have a specific gravity of not less than 0·94 at 77 deg. Fahr.

2. When evaporated in an open vessel at a temperature between 450 and 500 deg. Fahr. until the residue has a penetration (5 sec., 77 deg. Fahr., No. 2 needle, 100 grams) of 30 deg., the residue shall meet the following requirements:—

(*a*) It shall amount to not less than 60 per centum and not more than 70 per centum by weight of the original oil.

(*b*) It shall have a ductility at 77 deg. Fahr. of not less than 25 centimetres (Dow mould).

(*c*) It shall have a melting point of not more than 190 and not less than 130 deg. Fahr., when tested by the ball and ring method.

3. Fifty grams of the oil upon being maintained at a temperature of 325 deg. Fahr. for five hours in a cylindrical dish 2¼ in. in diameter and 1½ in. deep, shall not lose more than 12 per centum nor less than 7 per centum by weight.

4. It shall be soluble at air temperature in pure carbon bisulphide to the extent of not less than 99·0 per centum by weight.

5. (*a*) It shall be soluble at air temperature in 76 deg. Beaume paraffin petroleum naphtha to the extent of not less than 83 per centum and not more than 90 per centum.

(*b*) When 20 c.c.'s of naphtha solution, obtained by treating 1 gram of oil with 100 c.c.'s of 76 deg. Beaume petroleum paraffin naphtha at air temperature, is evaporated upon a glass plate, the residue shall be adhesive and sticky, but not oily.

6. It shall yield between 8 per centum and 12 per centum by weight of fixed carbon on ignition.

7. It shall show a flash point of not less than 150 deg. Fahr. when tested in an open cup.

8. It shall not contain more than 5 per centum by weight of paraffin scale.

HEAVY OIL.—Heavy oil shall have the following characteristics:—

1. It shall have a specific gravity of not less than 0·96 at 77 deg. Fahr. (25 deg. cent.).

2. When evaporated in an open vessel at a temperature between 450 and 500 deg. Fahr. until the residue has a penetration (5 seconds, 77 deg. Fahr., No. 2 needle, 100 grams) of 50 deg. the residue shall have the following requirements:—

(*a*) It shall amount to not less than 80 per centum by weight of the original oil.

(*b*) It shall have a ductility of 77 deg. Fahr. of not less than 40 centimetres.

(*c*) It shall have a melting point of not more than 160 and not less than 130 deg. Fahr. when tested by the ball and ring method.

3. Fifty grams of the oil upon being maintained at a uniform temperature of 325 deg. Fahr. for five hours in a cylindrical vessel 2¼ in. in diameter by 1½ in. deep, shall lose not more than 5 per centum by weight.

4. It shall be soluble at air temperature in pure carbon bisulphide to the extent of not less than 99·0 per centum by weight.

5. (*a*) It shall be soluble at air temperature in 76 deg. Beaume paraffin petroleum naphtha to the extent of not less than 75 per centum and not more than 90 per centum by weight.

(*b*) When 20 c.c.'s of naphtha solution, obtained by treating 1 gram of oil with 100 c.c.'s of 76 deg. Beaume petroleum paraffin naphtha at air temperature is evaporated upon a glass plate, the residue shall be adhesive and sticky, but not oily.

6. It shall yield between 8 per centum and 14 per centum by weight of fixed carbon on ignition.

7. It shall have a flash point of not less than 290 degs. Fahr. when tested in an open cup.

8. It shall not contain more than 5 per centum by weight of paraffin scale.

LONDON COUNTY COUNCIL TRAMWAYS.

SCHEME OF REORGANISATION.

Proposals for the reorganisation of the London County Council tramways system were submitted at Tuesday's meeting of that authority by the Highways Committee, and adopted.

The growth in working costs and the increasing complexity of passenger traffic operation in London would alone, it was stated, justify a review of the organisation of the department, and compel attention to the necessity for a most careful scrutiny of every part of the departmental machinery. The present organisation, it was added, had resulted largely from the natural growth of the undertaking, which from time to time absorbed the staffs of purchased companies' undertakings, and subsequently expanded with the development of the system. The following figures, from the accounts of the first complete year (to March 31, 1900), after the council commenced the working of the tramways, compared with similar information for the year ended March 31, 1914:—

	1900.	1914.
Miles of track open	21·375	144·85
Car miles run	10,208,161	59,209,289
Passengers carried	117,992,713	522,952,640
Total revenue	£170,098	£2,268,668
Total number of employees	2,750	12,232

During the same period the capital expenditure on the undertaking increased from £1,710,056 to £13,028,120.

Owing to departmental conditions the chief officer had, the report stated, hitherto been compelled to devote much time and attention to ordinary executive business, while the division of the department into ten sections had also rendered necessary great efforts in co-ordination. For these reasons he had been hampered in dealing with such important matters as the development and improvement of the system, and the consideration of larger questions of tramway working and policy. The committee were satisfied that the remedy lay in devolution, and they recommended, *inter alia*: That the tramways department be reorganised on the basis of the allocation of the work of the department among five branches—viz.: (1) Traffic branch; (2) electrical branch; (3) rolling-stock branch; (4) permanent-way branch; (5) general branch, and the devolution by the chief officer of tramways of duties and responsibilities to the higher subordinate officers upon general lines. That a traffic manager be appointed; and that the salary assigned to the position be from £1,200 by annual increments of £50 to £1,500 a year. That an electrical engineer be appointed; and that the salary assigned to the position be from £1,200 by annual increments of £50 to £1,500 a year. That a rolling-stock engineer be appointed, and the salary assigned to the position be from £1,000 by annual increments of £50 to £1,200 a year, and that the position be not filled at present. That in the ultimate organisation the salary assigned to the position of permanent-way engineer in the tramways department be from £800 by annual increments of £50 to £1,000 a year. The committee also recommended that positions as follows be established in the traffic branch, at the yearly salaries specified; Development superintendent (from £500 by four annual increments of £25 and four of £50 to £800 a year); publicity assistant (from £300 by annual increments of £25 to £400 a year); an officer in charge of matters relating to fares and independent traffic check (designation to be determined) (from £200 by annual increments of £25 to £400 a year); time-tables assistant (from £250 by annual increments of £12 10s. to £300 a year). That an operation superintendent (from £500 by four annual increments of £25 and two of £50 to £700 a year) be appointed in the traffic branch. That the designation of the two district traffic superintendents be altered to divisional superintendents; and that the salary assigned to each position in the ultimate organisation be from £300 by annual increments of £25 to £400 a year.

For the post of traffic manager the appointment of Mr. J. K. Bruce, the deputy chief officer, was suggested. Upon his transfer the position of deputy chief officer of tramways would be abolished.

Institution of Municipal and County Engineers.

SOUTH-EASTERN DISTRICT MEETING AT WESTMINSTER.

Mr. H. T. Chapman, district chairman, presided on Friday last at a meeting of members of the South-Eastern District of the Institution of Municipal and County Engineers, held at the institution offices, the attendance including Messrs. E. Annett (Gillingham), W. L. Bradley (Tonbridge), A. Dryland (Surrey), W. H. Grieves (Sutton, Surrey), J. L. Redfern (Gillingham), hon. district secretary, and F. J. Wood (East Sussex).

DISTRICT OFFICERS.

In the course of the proceedings Mr. A. Dryland (Surrey) was nominated for re-election as district representative, Mr. H. T. Chapman (Kent) as district chairman, and Mr. J. L. Redfern (Gillingham) as hon. district secretary.

The re-nomination of the following as members of the executive committee was also agreed to: Kent—Messrs. W. L. Bradley (Tonbridge), H. W. Longdin (Penge), F. Harris (Tonbridge Rural), and A. E. Nichols (Folkestone). Surrey—Messrs. J. H. Brierley (Richmond), W. H. Grieves (Sutton), R. Chart, junr. (Coulsdon), and F. Grove (Surrey). Sussex—Messrs. A. E. Prescott (Eastbourne), H. W. Bowen (West Sussex), F. J. Wood (East Sussex), and O. A. Bridges (Bognor).

A SPRING MEETING.

The district secretary reported that efforts had been made to arrange for a meeting of the district at Maidstone. It had been necessary, however, to abandon the idea of this gathering for the present, but he was hopeful that it would be possible to hold a meeting in a district nearer London, probably in April next.

ELECTION OF ASSOCIATE MEMBERS ON THE COUNCIL.

Mr. Grieves recalled the fact that at the annual meeting of the institution at Blackpool last June it was unanimously decided, on his proposition, to recommend the council to take into consideration the question of amending the by-law which limited the choice of members in the above matter by compelling them to vote for two associate members. Greatly to his surprise, the council, at their meeting in October, passed a resolution in the following terms: "That after years of consideration it is the opinion of the council that the method adopted is the best for securing the representation of the associate members on the council, and that therefore no action be taken." Mr. Grieves complained that he had had no intimation of any sort as to the decision of the council, and he considered that the treatment which had been accorded him could scarcely be described as fair, having regard to the Blackpool resolutions. Neither was it fair that they should be compelled to vote for two associate members whom they probably knew nothing about. His view was that election should be open as for other members of the council, and he moved that the council be asked to receive a deputation from the district on the matter.

The motion was agreed to, and Messrs. Chapman, Redfern, Dryland, and Grieves were appointed to form the deputation.

THE ORPHAN FUND.

The hon. district secretary reported the receipt of the following communication, dated November 11th last, from Mr. O. Claude Robson, hon. secretary and hon. treasurer of the institution's Orphan Fund:—

DEAR MR. REDFERN,—At a meeting of the Orphan Fund Committee on the 3rd inst., consideration was given to the question of enlisting closer co-operation with the various districts which it was thought would tend to augment the income of the Orphan Fund of the institution, which at the present time numbers but 217 subscribers from a total of 1,797 members, forming the muster roll of the institution. You will perhaps remember that the subject was broached by Mr. Massie at the annual meeting at Blackpool, when it was felt that some strenuous effort should be made to render the fund more worthy of the association by endeavouring to secure the sympathy and assistance of the various districts by utilising the machinery of the district committee for the purpose of increasing the number of subscribers to the fund. At the meeting of the Orphan Fund Committee before mentioned the matter was earnestly considered, and the following resolution was carried, viz.:—

"That one or more Orphan Fund stewards be appointed in each district to advocate the claims of the fund, to promulgate its work, to solicit and collect subscriptions and donations, to investigate cases needing assistance, and to report to the secretary on all questions relating to the work of the fund.

In the hope that some practical result may accrue from the foregoing resolution I was instructed to communicate with the secretaries and representatives of the various districts to nominate one or more members who would be willing to take in hand the office of steward as suggested in their respective districts, and thereby enable the committee to cope more generously with the distressful cases already being dealt with, and likewise afford sufficient funds for future cases which are most likely to occur these strenuous times. It is intended that the stewards should be "ex-officio" members of the committee of the fund, where their special knowledge of their particular districts would greatly assist in dealing with cases that come within their knowledge.

I should, therefore, be greatly favoured if you would kindly give the resolution your earnest consideration, and let me know at as early a date as possible as to the name or names of the members that are willing to act as stewards, in order that I may present the result of this appeal to the next meeting of the committee in December. I am also writing the chairman and representative of the district, with whom you will probably confer upon the matter.

Personally, I have endeavoured upon more than one occasion, by appeal to all members of the institution, to secure additional interest and assistance for the fund, but I feel sure if these appeals are made by one especially associated both professionally and socially with neighbouring members, that a better result may ensue.

I must apologise for the length of this communication, but sincerely hope that it may result in an initiative towards a brisker life for the Orphan Fund and corresponding advantage to the little ones of our friends who have been called away.

Faithfully yours,

O. CLAUDE ROBSON,

Hon. Secretary and Hon. Treasurer.

The CHAIRMAN said he thought those present would agree as to the urgency and necessity of augmenting the fund in view of the heavy demands which were certain to be made on it as a result of the war. One means of effecting the desired end would be to allocate to the fund a portion of the subscriptions of the whole body of members.

Mr. DRYLAND: Would the finances stand it?

Mr. REDFERN: Yes; it would be interesting to know whether there is any surplus on the present subscriptions. There is no doubt a good many subscriptions have been lost owing to the war.

The CHAIRMAN: Of course, whatever was allocated from the funds of the institution would not wholly meet the necessities of the case.

Mr. REDFERN: Does the institution itself contribute anything to the fund?

Mr. DRYLAND: I do not think it does.

Mr. REDFERN: Well, I think it ought to.

Mr. DRYLAND: The answer, I suppose, would be that the funds would not permit it.

The CHAIRMAN said there was no doubt Mr. Robson was an excellent secretary and treasurer, but it was obviously impossible for him to get into personal touch with all the members of the institution, and if arrangements could be made by which someone in each county could make appeals on behalf of the fund it would be more effectual than the present system.

It was agreed to appoint representatives in the several counties comprising the district, to act in the capacity of stewards, and it was further resolved that as the county surveyors had frequent opportunities of meeting the members, they should be asked to undertake the work in their respective areas.

STUDS ON AGRICULTURAL LOCOMOTIVE WHEELS.

The order, issued recently as a temporary war measure, making it permissible for the wheels of agricultural locomotives to be fitted with studs for use on frostbound roads, was referred to by Mr. Grieves, who stated that his council had on the previous night decided to forward a protest to the Local Government Board against the order. The effect of these studs was, he observed, particularly destructive on roads just getting free of frost.

Mr. CHAPMAN remarked that he had been asked for advice by several districts in Kent; but they had to remember the country was at war, and it was important that these vehicles should not be prevented from working.

It was pointed out that the damage would have been done before any effective steps could be taken to prevent it. What was of the greatest importance, however, was to see that the order was not allowed to continue in operation after the war.

After further discussion it was decided to ask the council to urge upon the authorities the desirability

of consulting the institution before such orders were issued.

A SANDGATE APPOINTMENT.

The Chairman drew attention to a recent advertisement of the Sandgate Urban District Council inviting applications for the temporary office of surveyor, water engineer, inspector of nuisances, &c., at a salary of £200.

Mr. Chapman stated that a letter had been sent by the Institution pointing out the inadequacy of the salary offered, and suggesting that the remuneration should be increased to £250 per annum.

Mr. Redfern observed that the institution ought to give their members hint not to apply for such positions.

Following further discussion, it was moved that it should be part of the duties of the council to deal with such matters in the interests of the members.

The resolution was agreed to, and the meeting shortly afterwards terminated.

NEWPORT (MON.) WATER SUPPLY.

THE CAERFANELL SCHEME.

In view of the probable development of Newport after the war, the corporation of the *South Wales Daily News* states, is making inquiries for a further water supply. Already they have provision for 675,000,000 gallons in their present reservoirs, but, according to a report submitted by Mr. J. F. Jupp, M.Inst.C.E., and Mr. H. Tremelling, the borough engineer, there will be a deficiency of 10,000 gallons per day in 1925. This will go on increasing, and in 1930 they estimate a daily deficiency of 1,359,478 gallons. The Henllys Reservoir scheme would only provide 1,000,000 gallons per day. They add that there is no site in Monmouthshire capable of yielding any large quantity of water by gravitation to Newport. They had inspected several sites on the borders of Breconshire—Cwmdu, near Talgarth; the Grwyne Fechan, in the Black Mountains; the Honddu, above Llanthony; and the Caerfanell, above Talybont. The latter had many advantages over the other sites for a large reservoir, and they considered it was the most suitable area they had seen to augment the supply.

THE SITE RECOMMENDED.

The Caerfanell was a tributary of the Usk, and the valley adjoined those of the Taff Vawr and Taff Vechan, which supplied Cardiff and Merthyr. There was an excellent site for a reservoir at Pont Rhydybine, 2¼ miles from Talybont. The reservoir would be 1¼ miles long, with 220 acres water area, with a capacity of over 2,000,000,000 gallons. The waters were part of those proposed to be utilised in the Welsh water scheme for London some years ago. The drainage area of 5,510 acres would yield 7,000,000 gallons per day. Mr. G. R. Thompson, the analyst, had reported it to be an excellent water for domestic supply. The distance of the site from Newport was 32 miles. The pipe line would proceed down the valley to Talybont, thence on the west side of the Usk past Llangynidr, Llangattock, Gilwern, Llanfoist, Llanover, Pontypool Road, Llantarnam, and Malpas, when they would connect with the present mains. Other than for one mile the whole of the 32 miles of pipe line would be in public roads, thus avoiding cost of easements.

ESTIMATED COST.

The following was an estimate of the cost of the works based on the 1916 prices:—

Reservoir at Caerfanell Valley	£200,000
Measurement Sluices	6,000
32 miles of pipe to Newport	151,000
Purchase of land and easements	30,000
Intervening reservoir at Malpas	1,000
Contingencies 15 per cent.	38,000
	£422,000

At the request of Alderman T. Parry, chairman of the Corporation Waterworks Committee, the borough engineer is to prepare a report on the cost to the rates if the scheme is adopted.

Change of Address.—Messrs. Siemens Brothers and Co., Limited, and Siemens Brothers Dynamo Works, Limited, have removed from Caxton House, Westminster, to Palace-plain-mansions, Kensington-court, London, W.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Is it a fact, as recently stated in an Irish paper, that a scheme for allotments which had been formulated by the Birr, Ireland, Urban District Council has been "killed" by the action of the Local Government Board of Ireland, who decline to allow to be taken by one tenant any allotment of an area exceeding one-eighth of an acre, whereas agreements had been entered into with several tenants to cultivate two or even three acres, at rentals that would cover all expenses? Does it not seem to be a curious anomaly—if the facts are correct—that, whereas, on the one hand, the Government are crying out for more land to be put under cultivation, the hide-bound, red-tape rules of a Government Department should seek to nullify this most desirable and essential movement?

* * * *

Is it not "a feather in the cap" of ferro-concrete construction when in a description in the February issue of *Fire* of the damage caused by the recent great explosion in the East of London it is stated that "not only have such structures withstood the effect of the air-wave, but they came through the ordeal of fire successfully"? The description also refers to the partial elasticity of such structures, which were able to "give" slightly to the shock, whereas "brick structures collapsed ignominiously, being pulled inward by the floor and roof joists and girders." When we know also that a reinforced-concrete roof is the best protection from a falling bomb, is it not evident that this form of construction has many merits over ordinary construction?

* * * *

Is it not fairly evident that one of the results of this terrible war will be to impress the people of this country, and perhaps those of other countries, that the man of the future will be the one who can do things, and not the orator—or political spouter? Will not science and practical knowledge take the place of so-called oratory, and the engineer be reckoned of more value than the politician, the lawyer, or the agitator? Is it not about time that those who make for the progress of the world should be properly recognised?

* * * *

Should not the war also be the means of furnishing names for new streets and roads, and is there not a good deal to be said in favour of the critics of a committee at Dudley for their want of originality in regard to street nomenclature in recommending that several new roads in a recently developed building estate should be named after local public men, "including several members of the committee," whereas the critics justly suggest that the streets should be named after our Army generals or places where our gallant fighters have achieved renown?

* * * *

Has the question ever been seriously considered in this country as to the time which should be taken in mixing a batch of concrete in order to produce the best result? In this connection is it not interesting to see that the chief engineer of the Pennsylvania State Highway Department has been recently carrying out some experiments in this direction with the following results:—

Time of mixing.	Number of revolutions of mixing machine.	Compressive strength of concrete. lb. per sq. in.
¼ minute	9	1,400
1 ,,	17	1,587
1½ minutes	20	1,926
2 ,,	36	1,661
3 ,,	51	1,673

The concrete blocks were all based on an age of eight days. Is it not evident from the excellent result obtained with the 1½-minute mixing test that this period seems to be about the right time to give?

* * * *

Is there any practical remedy for the enormous waste of water which occurs during periods of frost owing to the practice of consumers letting all their taps run so as to prevent the water freezing in the pipes? But if the pipes were allowed to freeze and burst, would there not be an enormous waste of water when the thaw occurred, and would it not be better if powers under an Act could be sought whereby the "undertakers" could refuse to supply water to any premises unless all the pipes were sufficiently protected by lagging or otherwise against the action of frost?

Highways and Byways.*

By LAWRENCE W. CHUBB, Secretary to the Commons and Footpaths Preservation Society.

The story of the King's highway has the rare merit of being able to arouse the interest and quicken the imagination of all sections of the community. It appeals to the historian and to the student of sociology, because each great era of road construction or improvement in this country has synchronised with vital changes in the social life and environment of the people, and in the economic development of the land. It was, for instance, due to the vast network of roads constructed during the period of Roman occupation that Britain was finally subjugated and the door was opened to the forces of civilisation as well as to the effective use of military power. Again, the coming of the Turnpike Trusts and "Macadam the Magician" contributed largely to the enormous expansion in industry and commerce which took place in the Georgian period. It will be the task of the future historian to appraise the services rendered by highways in these days when the fate of nations is in the melting-pot. In the meantime none will deny that problems of vital importance in connection with the rapid transit of troops and supplies have only been rendered possible of solution by practical experience gained on highways in connection with the development of the motor car.

The romantic and picturesque incidents associated with ancient and modern methods of travelling have, since the time of Chaucer, exercised a striking influence upon literature, and the subject of highways has, for mundane and other reasons, a great attraction for the lawyer and engineer. It makes its strongest appeal, however, to the imagination of the man in the street, for the word "highway" symbolises public rights and freedom—

"Fair and free, night and day,
Fair and free is the King's highway."

It is to this aspect of the subject that I desire mainly to draw attention, because, while every individual is personally concerned in the preservation of highways, few realise the limitations of public rights and the difficulty of maintaining them, or appreciate the ceaseless and bitter struggle which the Commons and Footpaths Preservation Society has found it necessary to wage on their behalf in order that those rights may be maintained.

A public highway may be defined as a strip of land over which every subject of the King is lawfully entitled to pass. The extent of his rights is another matter. If he is merely entitled to passage on foot, the way is a highway for foot-passengers only; if he is entitled to ride a horse over a track, the way is a bridle-path or horseway, and a footpath as well. If carriages may lawfully be driven by the public over the way, it is a carriage road and also a bridle-path and footpath.

EXTENT OF PUBLIC RIGHT.

The public right is confined to an easement of passage; it does not embrace the ownership of the soil, which, in most instances, remains vested in the adjoining owner or owners by whom, in normal cases, is owned the freehold to the centre of the metalled portion of the carriageway. That is why the timber growing on the open wastes at the sides of roads belongs to the adjoining owners. So jealously do the Courts preserve the landowner's interests that it has been held that a man is not entitled to walk backwards and forwards along a public path over a Yorkshire moor in such a way as to intertere with a grouse drive (*Harrison* v. *Duke of Rutland* (1893), 1 Q.B., 142). In delivering judgment in this case, Lord Justice Lopes enunciated the legal principle involved. He said: "If a person uses the soil of the highway for any purposes other than that in respect of which the dedication was made and the easement acquired, he is a trespasser. The easement acquired by the public is a right to pass and repass at their pleasure for the purpose of legitimate travel, and the use of the soil for any other purpose, whether lawful or unlawful, is an infringement of the rights of the owner of the soil, who has, subject to this easement, precisely the same estate in the soil as he had previously to any easement being acquired by the public." In another case (*Hickman* v. *Maisey* (1900), 1 Q.B., 752) the defendant was held to be a trespasser because he walked backwards and forwards along a public carriage road in order to observe the form of horses under training on adjacent downland. In this case, however, Lord Justice Smith held out a crumb of comfort to the weary wayfarer, for he said: "If a man while using a highway for passage sat down for a time to rest himself by the side of the road, to call that a trespass would be unreasonable. Similarly, if a man took a sketch from the highway I should say that no reasonable person would treat that as an act of trespass." In another dispute (*Fielden* v. *Cox* (1906), 22 T.L.R., 411) the Court declined to grant an injunction to restrain persons from trespassing on a highway by using it for the purpose of catching moths by means of lamps and other appliances, on the ground that the trespasses were merely technical.

Nevertheless, the strict legal view is that a pedestrian is not entitled to a general right to stray over land not dedicated to the public use and enjoyment, although that land is unenclosed common or open down, and so accustomed are we to speak with pride of an Englishman's rights that it comes almost as a shock when we first realise that his most comprehensive right—a right of way—is confined within exceedingly narrow limits, and that it is possible that a man may be a trespasser upon a public highway.

DEDICATION.

Having thus considered the nature of a public highway, it becomes necessary to make some inquiry into the origin and history of such ways. Theoretically every highway must have originated either by the operation of an Act of Parliament or by dedication—express or presumed—by some owner of the land over which it passes. Although, as we shall see, a number of carriage roads and fewer footpaths have been created by statutory authority, the vast majority are deemed to have come into existence by means of dedication. "Dedication" is the expression used to describe a convenient legal fiction devised to account for the existence of a public interest in highways. The word connotes the grant to the public, by some past or present freeholder of a perpetual right of passage over his land. On rare occasions dedication may be proved by the production of an actual grant, or it may be implied by special acts clearly indicating the intention of the owner to give to the public an inalienable right of passage. This form of dedication is known as "express" dedication, but it is not often possible to establish it. All that can be proved in normal cases is that, throughout living memory, a path or road has been publicly used as a thoroughfare, freely, openly, and without interruption. Where this is possible it is presumed that dedication has taken place, although no actual grant can be produced.

It is obvious that the percentage of rights of way which have been dedicated in a literal sense must be infinitesimal, for few owners would be inclined voluntarily to burden their property with an easement which, once existing, could only be lawfully extinguished by Act of Parliament, or by an elaborate and expensive process involving a Justices' Certificate and the consent of Quarter Sessions, or by the utter destruction of the way through some act of God.

When it is remembered that the antiquity of highways in general cannot be gainsaid, the doctrine of presumed dedication, and all that it involves, appears to the lay mind to be not far removed from the ridiculous. Some deeply-scored by-roads in use to-day probably existed as footpaths and pack-ways in the time of the early Britons for the conveyance of tin and furs in pre-Roman days. Yet each of them is deemed to have originated in dedication.

ORIGIN AND DEVELOPMENT OF OUR HIGHWAY SYSTEM.

Before asking you to consider the difficulties which the public encounter in maintaining their rights-of-way in consequence of the far-reaching effect of the theory of dedication and all that it implies, it may be convenient that I should outline the origin and development of our highway system, and the manner in which ways have been created by Act of Parlia-

*Paper read before the Royal Society of Arts on the 14th inst.

[illegible]. We owe the foundation of that system to the Romans. Those wonderful road-makers were worried by no [illegible] to deforestation or the sacred rights of property, but drove their ways over hill and dale, through marshes and dense woodlands, with a relentless purpose and patient industry which we can only admire with amazement.

The main Roman roads certainly extended for an aggregate distance of 2,500 miles, and some scholars of repute believe that their total length in Britain [illegible], with their connections, to over 4,566 miles. When it is remembered that the flint, gravel, and other material required for the high causeways in which the roads were formed sometimes had to be carried for great distances, it is possible to realise something of the marvellous achievement of the Romans.

The construction of important trunk roads must have led to the opening of many cross tracks, but there is no evidence of efforts to maintain any of the Roman roads after the departure of the legions. They endured in spite of neglect, because they were well built. Indeed, the four great routes, Watling-street, the Icknield Way, the Foss Way and Ermin-street came to be regarded as of value for a reason quite unconnected with traffic. They gave the King's peace or sanctuary to any man who fled to [illegible] success. While on them he was safe from pursuit or molestation.

With the imposition of the rule of the Norman and the organisation of the manor as a unit of local government, the maintenance of the King's highway was imposed as a theoretical duty upon the lord of the manor and his tenants subject to the adjustment and control of the Court Leet. Wheeled traffic was almost unknown, save for the rough carts [illegible] to carry home the crops, and the customary highways were for centuries almost exclusively traversed by pedestrians and horsemen. Until the dawn of the nineteenth century the principal part of the [illegible] in remote districts was conveyed to market by packhorses, although in some places common carriers were prepared even in the fourteenth century to convey grain by cart at the rate of one penny per ton per mile.

First Highway Acts.

The Statute of Winchester, passed in 1285, was the first Act of Parliament which purported to deal with roads. It did not go far, for it merely ordered that "highways leading from one market town to another shall be enlarged where as bushes, woods, or dykes be, so that there be neither dyke nor bush whereby a man may lurk to do hurt within 200 ft. of the one side and 200 ft. of the other side of the way." No attempt at actual maintenance of the surface of the highway was made, or was considered necessary, until the growth of vehicular traffic rendered repair an imperative necessity. If the way became foundrous or impassable, the traveller might deviate upon the adjoining land, even if cultivated, for the judges decided that it was "the good passage" that constituted the highway and not merely "the beaten track." Where the land on either side of a public way remains unenclosed this rule still obtains, and [illegible] are entitled to separate the highway from [illegible] and the burden of repair, *prima facie*, [illegible] on the adjoining occupier, as long as his [illegible] debar the public from their common law [illegible].

It is not until [illegible] another Highways Act [illegible] Mending of Highways Act, 2 & 3, Philip & Mary (1555), and this once and for all cast upon the inhabitants the obligation to maintain the highways in their parishes. Surveyors of highways were ordained to be appointed by the parishioners and were authorised and required to direct the performance of statute labour upon the roads. This was a form of "[illegible]" which no man might lawfully evade, but which imposed a burden from which all [illegible] themselves. Roads became more neglected than ever, and were more polluted by large droves of cattle, sheep and pigs [illegible] usually tramped their way along the [illegible] from Norfolk to the markets of London. Many new highways, too, came into existence with the passage [illegible] Acts authorising the inclosure of commons. The general result of the Acts [illegible] the setting out of [illegible] and the question of repair remained unsolved. Turnpike trusts were therefore destined to remedy the deplorable state of neglect into which the King's highways had fallen. Certain individuals, with a view to the repair of particular roads, subscribed among themselves for that purpose, and erected gates upon the roads, taking tolls from those who passed through them.

The Turnpike Trusts.

The first scheme of this kind received the consent of Parliament in 1663, and dealt with ways in Herts, Cambs, and Hunts. It was not, however, until 1706 that the first Turnpike Act proper was passed. This proved so successful that, altogether, over 1,100 turnpike trusts were created in England and Wales, having under their control 23,000 miles of road and enjoying and spending a gross annual revenue of £1,500,000. Each trust was empowered to construct and maintain a specified piece of road and to levy tolls for a limited period of years, usually twenty-one. The powers were renewed from time to time, and Parliament further permitted the Surveyor of Turnpike Trusts to require the performance on the roads under his charge of the unpopular and personal obligation of Statute Duty and Team Labour first sanctioned in 1555.

(To be continued.)

MOTOR MACHINE BROOMS AT SHOREDITCH.

RESULTS OF TWELVE MONTHS' WORKING.

In a report to his Highways Committee on the working of two "Laffly" motor machine brooms at Shoreditch during the past twelve months, Mr. C. T. Fulcher, the acting borough surveyor, directs attention to the excellent financial results obtained and to the efficiency achieved by their use.

The particulars are briefly as follows, while the details are as per statements attached:

Machine No. 1 commenced work on January 24, 1916.

Machine No. 2 commenced work on April 15, 1916.

Actual car mileage 31,339 miles, as against 23,920 miles worked by old horse machines, or 31 per cent more than was ever scavenged by the old horse machines, and therefore 31 per cent more than estimated for.

Actual cost of running, including depreciation, £838 5s. 2d., to which should be added £100 for tyre renewals and overhauling, due shortly, making a total of £938 5s. 2d., as against an estimated expenditure of £1,114 15s., thereby showing a saving against the estimate of £176 9s. 10d.

In addition, their use has caused very considerable saving in other sections of the scavenging department, which has resulted in a total saving of £1,444 14s. 10d. on the expenditure which would have been incurred if the use of horse machines had been continued.

This is to be understood more exactly by the following:

	£	s.	d.
Estimated cost of horse machines on the old scale of operations, for the period during which the motors have been employed, as per Statement No. 2	1,148	4	0
Actual saving on previous method with horse machines on night scavenging, as per Statement No. 3	537	0	0
Actual saving on day orderly work, as per Statement No. 4	357	16	0
Actual saving by non-purchase of horses, taken at 3 horses only, at £80 each	240	0	0
	£2,283	0	0
Loss—Motor machine costs as per Statement No. 1	838	5	2
Net saving	£1,444	14	10

Against this saving an allowance of £100, beforementioned, for overhauling, &c., should be made.

"Also it should be remembered," says Mr. Fulcher, "that, over and above this saving, I consider the value of their assistance in the several falls of snow which have occurred resulted in a saving of at least £350, so that it may be taken that their adoption has resulted in a gross saving of £1,795 on the expenses which would have been incurred by the continued use of the horse machines.

"Regarding the actual machines themselves, they have more than fulfilled the expectations I had concerning them, and it is a matter for congratulation that no mechanical troubles have occurred, with the slight exception that for two nights, and that on one machine only, has either machine been out of service. The tooth in the driving gear which broke

off and occasioned this stoppage was speedily put right, and the machines are running as well as—in fact, really better than—when they were first purchased.

"The small quantity of petrol consumed, and the high mileage per gallon—*i.e.*, 14 miles per gallon—is in itself remarkable, and is largely accounted for by the fact that the majority of the work is performed at night, when the streets are free from traffic, and the machines obtain long, uninterrupted runs."

In Mr. Fulcher's opinion the results obtained thoroughly justify the optimism with which the committee sent their report on his proposal to the council; and, in conclusion, he expresses his appreciation of the enthusiasm and ungrudging manner in which the men, and in particular Mr. Eastop, the wharf inspector, have worked to ensure the machines proving a success.

(1) RUNNING COSTS, 24TH JANUARY, 1916, TO 20TH JANUARY, 1917.

	£ s. d.	£ s. d.
Drivers' wages		262 2 0

Cost per car mile	6·419	pence
Cost per mile of thoroughfare	38·517	pence
Cost per working hour	50·726	pence

(2) ESTIMATED COST OF RUNNING HORSE BROOMS DURING SAME PERIOD.

	£ s. d.
Wages of drivers	475 4 0
Keep of horses (including veterinary attendance and shoeing)	288 0 0
Repairs and depreciation, harness... ...	12 0 0
" " " machines ...	70 0 0
Depreciation of horses	110 0 0
Broom refills	183 0 0
Men's clothing	7 0 0
Lubricating and lamp oils	3 0 0
	£1,148 4 0
Approximate mileage...	23,920 miles

(3) ACTUAL SAVING ON NIGHT SCAVENGING OPERATIONS.

	£ s. d.
Wages, three drivers	260 0 0
Keep, three horses at £1 per week (including veterinary attendance and shoeing)	156 0 0
Repairs and depreciation, 3 water vans at £5	15 0 0
Repairs and depreciation, 3 sets harness at £2	6 0 0
Water	100 0 0
	£537 0 0

(4) ACTUAL SAVING ON DAY ORDERLY SCAVENGING.

	£ s. d.
Wages, four sweepers	332 16 0
Brooms and squeegees	25 0 0
	£357 16 0

Municipal Bills in Parliament.—The Barrow-in-Furness Corporation Water Bill, the Blackpool Improvement Bill, and the Sheffield Corporation Bill have been read a second time in the House of Commons, and sent forward to Committees for consideration.

LOCAL AUTHORITIES AND LAND CULTIVATION.

SUPPLY OF SEED POTATOES AT SOUTHALL-NORWOOD.

Mr. Reginald Brown, M.INST.C.E., the engineer and surveyor to the Southall-Norwood Council, has tackled with characteristic energy the question of the supply of seed potatoes to the amateur cultivators in his district. On the 6th inst. Mr. Brown issued, through the medium of the local Press, the following notice:—

KIND OF SEED. The classes of seed which it is hoped to supply are: Sharpe's Express, Eclipse and British Queen, King Edward, Up-to-date, and Arran Chief. The best endeavours will be made to secure these seeds, but it must be clearly understood that it may be necessary to accept other and similar classes, as there may be a difficulty in obtaining some of those mentioned, especially Eclipse and Arran Chief.

PRICE OF SEED.—The price to be paid by the cultivators for seeds delivered—as hereafter defined—will be, approximately, as follows (all at per cwt.):—

Sharpe's Express, 16s.; British Queen, 15s.; King Edward, 15s.; Up-to-date, 15s.; Arran Chief, 16s. I have no quotation yet for Eclipse, but cultivators may have to accept British Queen instead.

ALLOCATION OF SEED.—Those cultivators who have expressed a desire for seed other than those in the above list will be allotted one of the sorts named in the list in lieu thereof.

DELIVERY OF SEED.—If possible delivery will be made to the cultivators' houses in cwt. lots, and those who have ordered quantities of less than 1 cwt. will have to make arrangements to fetch their seed; but in the latter case delivery will, it is hoped, be made as near as possible to residence of the cultivators—probably with some house in the same street. The places to which the seed will be sent will be conveyed to each cultivator on "payment" day, or by public notice.

PAYMENT FOR SEEDS. So as to save correspondence and booking, all seed must be paid for before the order is placed with the merchant. For this purpose I appoint Wednesday next, the 14th inst., as "payment" day, between the hours of 10 a.m. and 12 noon, 2 p.m. and 4 p.m., and 6 p.m. and 8 p.m. All those who have placed orders for seed potatoes will be expected to attend personally at, or send a responsible representative to, my office, and deposit the estimated cost of the seed required by them. If the actual cost is less than the amount deposited, the excess will be refunded to the payee, and if the actual cost exceeds the amounted deposited, the payee will be called upon to pay the excess.

I want it to be clearly understood that all seed must be paid for on the day named, as orders will be sent for delivery of seed on the following day (15th inst.), and unless payment is made the orders will not go forward, and cultivators will be disappointed. This arrangement is absolutely necessary under the circumstances of the case.

The success which has attended Mr. Brown's efforts is apparent from the report in last week's *Southall-Norwood Gazette* that, on the appointed day, his office was besieged by applicants for seed potatoes, the amount taken during the afternoon alone being over £200. There were still more applicants in the evening, and the town hall was continually crowded with a queue waiting to enter the office, and it was well after nine o'clock before the last applicant had been attended to. The total amount of cash taken was about £400.

Salford War Bonuses.—War bonuses amounting to £23,000 per annum have been granted to all employees of Salford Corporation whose salaries or wages do not exceed £300 a year.

Linking up of Electricity Works.—Mr. Lawrence J. Kettle, M.I.E.E., deputy city electrical engineer of Dublin, gave a lecture at the Dublin College of Science on the 16th inst. on "The City of Dublin Electricity Works," in the course of which he suggested linking up the various electricity works in the Dublin district, and supplying them, as far as possible, from one station. In addition, he said, portions of the County Dublin might be taken in, and should supply a paying load. The saving in supply costs which could be effected would probably be several thousand pounds per annum, and this should justify a considerable capital expenditure and still show a profit margin. The suggestion was, at any rate, worthy of consideration.

Fires and Wide Streets.—In a paper on "Fire Insurance in its Relation to Buildings and Architecture," which he read at a meeting of the Insurance Institute of London on Monday, Sir Aston Webb, R.A., said that wide streets were a great means of protection from the spread of fire from one building to the opposite one. The City of London was a great sinner in this respect, many of the streets not being more than 20 ft. to 25 ft. wide, which enabled the buildings opposite easily to catch alight. They certainly did not want another Great Fire of London, but were it to happen he believed that as the last Great Fire changed London buildings externally in four years from wood to brick, another would change them internally from wood to concrete

VENT SHAFTS ON PRIVATE HOUSE DRAINS.

To the Editor of THE SURVEYOR.

SIR,—The illustrations on p. 166 of your issue of the 9th inst. immediately arrested my attention upon opening THE SURVEYOR. They are tasteful and wonderful, but awfully pretty. The bends, elbows, square junctions, vertical drops, traps, syphons, specials, elongated sink wastes, "two-way" pieces, fresh-air inlet, double inlets, &c., are marvellous, and the whole system appears to be incapable of further mean development.

In the absence of any special mention, the fresh-air inlet appears to be unpatented, finished flush with top of pavement, and therefore capable of emitting all the foul emanations within the confines

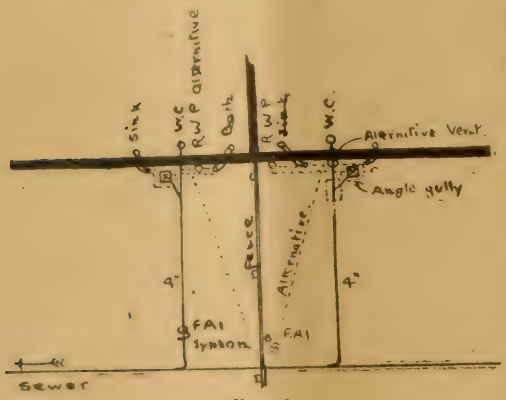

FIG. 1.

of the drains. With the exception of being able to plunge the syphons, access to any part of the drain is not available in case of obstruction without smashing this wonderful contraption. Whatever use may be made of this system in Scotland, I venture to predict that it will never be copied in England—by an expert.

It is only just that I should "stand up" to Mr. Shatto, the architects and the Dean of Guild Court.

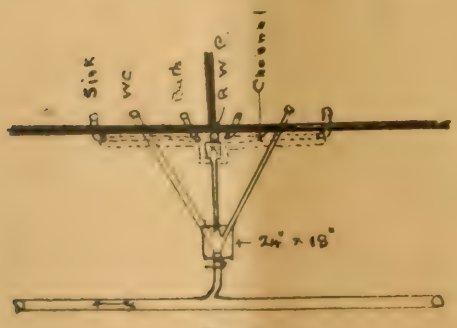

FIG. 2.

by publishing [illegible] permission alternative plans and I will take a knock-out blow with the best grace possible.

The absence of a back elevation to the house prevents one being in doubt as to the merits of the alternative suggested. A dividing fence between [illegible] would materially alter the aspects of the case. Rain-water pipes and yard gullies are abominations [illegible] to endeavour [illegible] syphonage up to "whose turn it is to clean them." [illegible] in the long run, a more way of economising [illegible] the labour.

[illegible] are decidedly the best and cheapest, although [illegible] not appear to have received [illegible] scathing scheme. Even with the [illegible] there are numerous possible variations. I would omit the yard syphon and fresh-air inlet, inserting instead a 3-in. or 4-in. cast-iron vent pipe, square off the drain up each house if windows were not in the way, thus ventilating drain and sewer. If bedroom windows were well below the level of guttering, the vent pipe, which would, of course, be properly caulked, might be used as a rain-water pipe, thus obviating duplication of stack pipe up the house. If a fresh-air inlet is imperative and a vent unnecessary, converge drains towards dividing fence (if there be one), and erect a single or joint shaft on

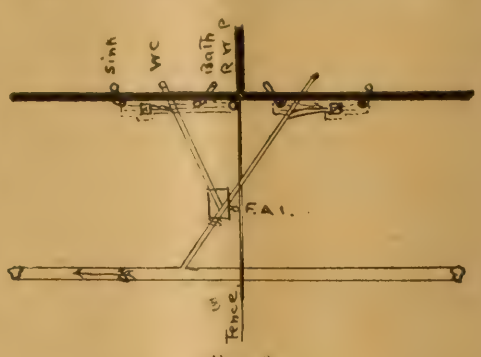

FIG. 3.

the fence, it may be 1 ft. or 6 ft. high. An extra 5os. would insert an inspection chamber 18 in. by 21 in., with rodding-arm syphon in wall, and this is a sound investment. One would naturally bring a 2-in. rain-water pipe down somewhere near the gully, unless it were imperative to bring a joint one down centre, although it would cost £1 extra. A blue brick or concrete gutter from foot of same to gully can be formed at a very slightly higher cost than plain paving. With twenty years' experience, I venture to say that a cottage sink and bath are better without traps, which are continually becoming obstructed. "Deliver the stuff on to the surface outside as soon as you can" is a sound axiom.

(2) This may be used where no dividing fence is erected, and has as many variants as No. 1.

(3) This meets the views of those who favour the drains entering the sewer with the flow, which has no particular merit in my eyes. It also has the advantage of bringing the drains from under centre of fence.—Yours, &c.,

T. H. NEGUS, M.I.M. AND CO.E.

Coleshill.

COINAGE DECIMALISATION BILL.

To the Editor of THE SURVEYOR.

SIR,—I would invite your attention to a draft of a proposed Bill for the Decimalisation of our Coinage, published for general information in the *Times* Trade Supplement of February, 1917. The draft is, apparently, to be circulated to British Chambers of Commerce only, when, if approved, the Bill will be laid before Parliament. The question concerns other people besides members of the Chambers, and the terms of the Bill are well worth consideration. Compulsion is intended for there is a clause making it illegal to use any other than the decimal "coins of account" as such, and making void any document in which, after the proposed date of the Act (1917) any other coins are mentioned.

I may add that there is a very strong feeling among engineers and manufacturers that the Decimal Association is not "playing the game." The engineering professions and working classes are straining every nerve, and devoting all their energies mental and physical, to beating the enemy in munitions, ships, plant, &c. The decimal agitators chose the awful time when their ironcrest opponents are either nearly worked to death at home or in the trenches abroad to press the passage of an Act which the engineering classes of this country think unfair, injurious, and unnecessary. Without muni-

tions, not human coinage, gold, nor credit are of avail. If any of the British deserve consideration, who but those men who have, for the *n*th time in our Island story, consecrated the British inch, the British pound weight, and the British penny with their blood and their sweat? Our export trade depends upon the engineer and the manufacturer, and financiers and merchants are willing enough, when it suits them to do so, to proclaim that our exports must at least balance our imports, yet the same commercial community cannot refrain from constant nagging at, and continual meddling with, the units the engineering classes find essential to their business.

The first schedule at the end of the draft Bill ought to be a revelation to most people. It is proposed to retain the sovereign and half-sovereign as they are. We are to have four-shilling and two-shilling pieces, and to abolish the crown and half-crown. The shilling is to be called a 50-cent piece, and the sixpence a 25-cent piece. So far, the coins seem merely to change their names; but, in spite of metric bounce that halves and quarters are permissible, we are to be deprived of the useful half-crown.

The penny and farthing (as we know them) are to be abolished, and in their place we are to get a British dime of 2·4d., a half-dime of 1·2d., a new penny of 0·96d., a new half-penny of 0·48d., and a British cent or new farthing of 0·24d. That is, 12½ pennies will make a shilling, an "awkward, vile, intolerable, clumsy" number; worse, if anything, than the "5½ yds. which metric advocates so much object as to making the British 5-metre rod, pole, or perch! Further, no dealer in his senses could possibly take 0·96d. for an existing pennyworth; so, accepting the above two practical objections as insurmountable, it seems certain that the actual new penny must be the 5-cent half-dime, valued at 1·2d.

Your readers will notice that the smaller coins only are affected, and with them every small transaction. The poor, and men and women of moderate means, will pay for the privilege of decimalisation of the British coinage. Fluctuations in prices do not affect the issue, as that great statesman, Mr. Gladstone, plainly saw. Whatever the current prices at the time of the passing of the Act may be, the new penny will NOT be accepted as the equivalent of the present penny; and the next coin is nearly a penny-farthing, in present values.

The most curious thing in the tangle is the inability of decimalists to perceive that for the purposes of accounting of all kinds, for wholesale and foreign trade, and in large transactions, they possess an invaluable decimal currency already. If the sovereign is divided into 1,000 imaginary cents of account, NOT COINED, the matter is perfectly clear. Sums can be stated, and books kept, in pounds, florins, and decimals of florins. For practical use, in home payments of all kinds, there would exist the sovereign of 1,000 cents, the half-sovereign of 500, the crown of 250, the half-crown of 125, the florin of 100, the shilling of 50, the sixpence of 25, and the three-penny bit of 12½ "cents of account." For smaller sums only, the practical equivalent for a cent would be an existing farthing. We merely divide the three-penny bit into 12 convenient instead of 12½ inconvenient parts.

There is no case at all for "decimalisation," in either British currency or weights and measures. We have everything necessary for working in tens in both systems already. The agitation is purely artificial.—Yours, &c.,

E. A. W. PHILLIPS, M.INST.C.E.

Hove.
February 15, 1917.

THE SUGGESTED IRISH CONGRESS.

To the Editor of THE SURVEYOR.

SIR,—"Notes from Ireland" in the issue of THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER for January 19th last contained some very practical suggestions for co-operation among members of the Institution of Municipal and County Engineers in Ireland, and, in fact, for members of the engineering profession in Ireland generally.

A good deal could be done to make the professional work which usually falls to the lot of the average surveyor engaged by local authorities more interesting and instructive by a broadening of ideas accomplished by frequent conferences and annual congresses. Take, for example, the amount of good which would result from, say, a discussion as to the methods, &c., adopted by the several district councils in Ireland in the carrying out of work under the Labourers' Acts. I suggest that such a national question could be solved more easily by a national congress.

In order therefore to help the project contained in the former issue of your paper, I ask that all engineers, architects and surveyors in Ireland who would be willing to assist in bringing such a congress together and help in its initial stages, communicate with Mr. Sellars, town surveyor, Dundalk. I am taking for granted that Mr. Sellars would be willing for the time being to act as secretary.—Yours, &c.,

PATRICK COUGHLAN.

Mitchelstown.
February 16, 1917.

Stockton's Proposed Municipal Piggery.—Provided the sanction of the Local Government Board is obtained, Stockton is to try the experiment of a municipal piggery.

Junior Institution of Engineers.—At a meeting of this body, to be held this (Friday) evening, at 7.30, a paper, entitled "Random Notes on Structural Design," will be presented by Mr. C. G. D. Burdett.

Rosyth Town-planning Scheme.—It was stated in the House of Commons, in answer to a question, that the Rosyth town-planning scheme had not yet been approved, for reasons already given, but that no avoidable delay would occur in proceeding with its consideration.

A War Office Gift. Esher and the Dittons Urban District Council have accepted from the War Office the gift of an 8·8 mm. field gun, which was taken in action in France. Subject to the approval of the Lady of the Manor, H.R.H. the Duchess of Albany, the gun will stand on the Esher village green, on a site overlooking the main Portsmouth road.

Building Licences. Replying to a question in the House of Commons, the Minister of Munitions stated that he was obliged to consider for the future a further limitation of building licences, and added that it would be of great assistance if applications even for small amounts were limited to those required for urgent repairs or for work of national importance.

The Metric System. The annual conference of the Association of Chambers of Commerce will be asked to approve a resolution urging the Government to introduce the metric system as early as possible, and to represent to Canada, Australia, and South Africa that it would assist the trade of the Empire if they adopted legislation on the same lines. It is also suggested that the Government should ascertain from Russia and the United States whether they can take similar steps, so that the system of weights and measures may be uniform in all the civilised countries of the world.

Causes of Cracks in Concrete Roads.*

By A. T. GOLDBECK, Engineer of Tests, Office of Public Roads and Rural Engineering, United States Department of Agriculture.

It is the intent of this paper to treat merely of the causes of cracking of concrete roads in the light of our present knowledge of the subject. There are many phases of the question of cracking that might properly be brought out in a discussion, such as the effect of cracking on the life of the road, the expense of and best methods of the maintenance of cracks, and many other allied questions. All of these, however, have been avoided, and an effort has been made to treat only that phase of the subject suggested in the title.

When the internal stress in a material reaches the ultimate strength, failure ensues and manifests itself in various ways. In a brittle material like concrete a crack indicates that the ultimate internal resisting stress, whether it is tension, compression, or shear, has been exceeded, and therefore, in order to analyse the cause of cracks in a concrete road, we must first discover the cause of the high internal stresses existing at rupture. This is a difficult task, as the internal stresses in concrete and reinforced concrete pavements are very complex, and may be caused by a number of different phenomena acting simultaneously.

A concrete road slab is attacked by many forces which slide it, in part or as a whole, along its sub-base; which bend it and warp it; which subject it to impact and shear, and may even act within its interior to exert a disrupting effect. It is little wonder that concrete roads crack, since, due to the lack of experimental data, they are constructed without sufficient knowledge of the forces to which they will be subjected.

COMPLEXITY OF STRESSES.

Let the life of a slab in the road be traced from the day it is poured in order that the complexity of stresses to which it is subjected may be studied. For about ten days or two weeks after the slab is laid and while the concrete is hardening, it is the practice, for several reasons, to keep the surface thoroughly wet. In the first place, water is necessary to hydrate the more inactive particles of cement, and, moreover, it has been discovered that as long as concrete is kept wet its length changes but very little, provided the temperature remains constant. Any slight change that does take place due to moisture is favourable to the integrity of the concrete, because moisture expands concrete, and tends to produce small compressive stresses, owing to the frictional resistance at the sub-base against this expansive movement. Should the temperature rise during this initial period, additional expansion will result with increased compressive stress in the concrete. Even this combined compressive stress, however, is seldom likely to be very large during the initial stages of hardening and may be neglected, as the concrete is generally sufficiently strong in compression to withstand the small forces then being exerted. Should there occur a large decrease in temperature during this initial period, the concrete will contract, causing it to move with respect to its sub-base. The forces of friction thereby developed produce tension, and as green concrete is weak in tension a decrease in temperature, when the pavement is only a few days old, may cause cracks.

Suppose the road survives this initial period without mishap and is thrown open to traffic. Immediately it begins to dry out and due to this cause it starts to shrink. The friction forces at the base immediately resist this shrinkage, and the result is tension in the concrete. If the tension is too great, the concrete cracks where the tensile strength of the concrete has been exceeded. As the seasons of the year succeed one another, the slab is alternately wetted and dried, and in addition subjected to a wide range of temperatures, being thus kept in constant motion over its sub-base. The forces of friction are therefore in constant action resisting this motion, and thus cause stresses, now tensile, now compressive, to exist in the concrete. Should the forces of friction be sufficiently great, the resistance of the concrete is overcome, and it fails, either in tension or compression, with one of two results, the concrete is cracked, or else bulged up or crushed. Sometimes moisture and temperature aid one another, and sometimes they counteract one another, but their activities are never ended during the existence of the road. Naturally, as friction can best be developed along the length of the road, temperature changes and moisture are promotive of transverse cracks rather than longitudinal cracks.

BENDING STRESSES IN THE SLAB.

In addition to direct compressive and tensile stresses, road slabs are subjected to bending, due to the loads of traffic and more likely to unequal settlement of the sub-base, caused by lack of homogeneity. Ununiform reaction between the slab and the sub-base due to frost may also produce cracking, the slab then being supported in some spots and not in others, thereby creating large tensile stress in bending. Frost action is more likely to cause longitudinal cracks than transverse cracks. The expanding and shrinking of the sub-base, due to varying moisture content, is also promotive of bending stresses and consequent cracking in the concrete.

In a general way the foregoing discussion treats of some of the causes of cracking of concrete pavements, and these causes can best be classified as follows:—

1. Expansion and contraction. (*a*) Change in temperature; (*b*) change in moisture content.
2. Ununiform bearing under the slab. (*a*) Frost action; (*b*) lack of homogeneity in sub-base; (*c*) moisture expansion and shrinkage of the sub-base.
3. Excessive bending stress due to heavy loads and impact.

These causes will be considered in detail so far as our present knowledge will permit.

EXPANSION AND CONTRACTION.

(*a*) Change in temperature: It has been well established by several investigators that concrete expands and contracts as the temperature changes, and the amount of movement equals 0·0000055 in. per inch of length. If a concrete road is built in the summer season when the temperature is 90 deg. Fahr. and the temperature in the following winter falls to 0 deg. Fahr., the concrete must contract an amount equal to $0{\cdot}0000055 \times 90 \times 0{\cdot}00495$ in. per inch of length. This contraction could do no harm if it were not for the resistance offered by friction between the sub-base and the slab. When the concrete contracts, the friction at the base resists the contraction and the amount of tension produced in the concrete is dependent on the amount of friction acting. Friction at the base varies with the kind of base, and the degree of roughness and tests recently made by the author throw some light on the amount of friction that can act at the sub-base when the slab expands and contracts.

Frictional Resistance of Concrete on Various Sub-bases.

Kind of base.	Movement.	Force.	Coefficient.	Movement.	Force.	Coefficient.	Movement.	Force.	Coefficient.
Level clay	0·001	480	0·55	0·01	1,130	1·3	0·05	1,800	2·07
Uneven clay	0·001	500	0·57	0·01	1,120	1·29	0·05	1,800	2·07
Loam	0·001	300	0·34	0·01	1,030	1·18	0·05	1,800	2·07
Level sand	0·001	600	0·69	0·01	1,080	1·24	0·05	1,200	1·38
Fine gravel	0·001	450	0·52	0·01	960	1·10	0·05	1,100	1·26
Fine broken stone	0·001	380	0·44	0·01	800	0·92	0·05	950	1·09
Coarse broken stone	0·001	1,060	1·84	0·01	1,550	1·78	0·05	1,900	2·18

* Paper read before the American Society for the Advancement of Science.

FRICTION AT THE SUB-BASE.

The tests referred to above were made by sliding 2-ft. × 6-ft. × 6-in. concrete slabs along previously prepared sub-bases. The sliding force was applied by means of a long lever, and the magnitude of the force was measured with a carefully calibrated dynamometer. The amount of movement of the slab was read with a Berry strain gauge while the load increased slowly and steadily.

As the load was applied, the slabs seemed to move very slightly, even at the first application, except where a sub-base of large broken stone was used. In this instance a high load was necessary to start the slab in motion, after which it required no more load than some of the other bases. Apparently there does not exist a constant value for the coefficient of friction, for the greater the displacement the greater the force of friction becomes.

The values of the frictional resistance offered at various displacements are given in the foregoing table.

When the slab on the loam base had been slid 0·035 in., the then existing load of 1,600 lb. was released to zero, and the slab recovered 0·047 in. of its motion. From this recovery behaviour it is seen that the sub-base acts in a somewhat elastic manner, and some of the resistance offered to the expansion and contraction of the slab must be that necessary to deform the sub-base. The material of the sub-base is far from being perfectly elastic, and it must, therefore, gradually yield under a slowly-applied load, such as would obtain in the expansion and contraction of concrete pavements. Hence it is not at all reasonable to assume that the maximum friction shown in the tests described actually exists in concrete pavements, even where their movement is large. The above tests were made in periods of about ten minutes each, while the corresponding movements in the road might take days.

MOISTURE SHRINKAGE.

When a specimen of concrete is permitted to harden under continually moist conditions, it expands slightly; on the other hand, shrinkage takes place when it hardens in a dry atmosphere. The amounts of expansion and contraction are dependent to some extent on the richness of the mixture and also on the thoroughness of the drying. For instance, consider the experiments on two specimens, 1:2:4 and 1:3:6 concrete, of very wet and very dry consistency. Several days after hardening they were immersed in water, and extensometer readings were made on them at frequent intervals. As long as they were wet they remained expanded, with the maximum expansion of 0·0001 in. per inch of length. After six months they were removed from the water and allowed to dry out in the warm, dry air of the laboratory, when they immediately began to contract, reaching an ultimate contraction of 0·0008 in. per inch of length. It must be emphasised, however, that these specimens became exceedingly dry in a very short time after their removal to the air of the laboratory, and probably very much dryer than they could ever become in the road.

When specimens are subjected to the every-day wet and dry weather conditions, they do not change in length very much due to change in moisture content, because their moisture content does not vary greatly under such conditions. Concrete in the road may, under exceptional conditions, be made to suffer extreme drying, but it is very probable that most concrete roads absorb much water by capillarity from the damp or wet underlying sub-base, and moreover, the water that is absorbed during a period of wet weather does not completely evaporate between successive spells of wet weather. However, there is sufficient evaporation from the surface to cause some shrinkage of concrete in the road, as evidenced by the formation of cracks when road slabs are allowed to dry out too quickly. The maximum amount of shrinkage that concrete can reach is 0·0008 in. per inch of length, but it is probable that, in general, the moisture shrinkage of concrete road slabs does not exceed more than 0·0004 in.

COMBINED MOISTURE AND TEMPERATURE CHANGES.

It is evident, therefore, that both moisture and temperature act to cause creeping of the slab in the road, and it must be realised that the relative magnitude of these two effects depends on the range of temperature, on the rainfall and on the drainage of the sub-base. In an exceptionally well-drained sub-base and in a dry climate the moisture shrinkage of the concrete will be large, and will add to the contraction due to changes of temperature. This shrinkage may amount to 0·0004 in. per inch of length, and if there is a decrease in temperature of 100 deg. Fahr. there will be an additional shrinkage of 100 × 0·0000055 = 0·00055 in. or a total shrinkage of 0·00095, or, roughly, 0·001 in. for each inch of length. On the other hand, there may be much moisture in the sub-base which will keep the concrete expanded 0·0001, and the net shrinkage will then equal 0·00055 −0·0001, or only 0·00045 in.

It has been pointed out that the sliding of concrete along the sub-base develops frictional resistance of considerable magnitude, and when the tension developed in the concrete due to the forces of friction exceeds the tensile strength of the concrete a crack must form. Let the coefficient of friction be equal to 1·0, and assume the tensile strength of the concrete to be 150 lb. per sq. in. Let L equal the distance between cracks, then, in a slab 12 in. wide and 6 in. thick, the stress at rupture equals 72 sq. in. × 150 lb. = 10,800 lb. This stress must be supplied by the forces of friction acting over the distance between cracks, or fLw = 72 sq. in. × 150 lb. per square inch where w equals the weight of the concrete per linear foot. This equation reduced to 1·0L72 = 72 × 150 or L = 150, the distance between cracks. If f = 2·0, then L = 75 ft., so that the greater the friction the closer will be the spacing between cracks.

The above calculations indicate the advisability of forming the sub-base as smoothly as possible. Of course, the tensile strength of the concrete cannot obtain unless the concrete is stretched sufficiently. When 150 lb. per square inch exists in the concrete, each inch is stretched 150/3,000,000 = 0·00005 in., and it has been shown that the shrinkage due to moisture and temperature change may amount to 0·00095 in., far in excess of the amount required to cause rupture.

The foregoing considerations are based on mature concrete. When the concrete is only a few days old, the tensile strength is very small indeed, and the modulus of elasticity is likewise low. When but two days old the tensile strength may be as low as 50 lb. per square inch, and the modulus of elasticity in tension may be only 1,000,000. The stretch required to produce rupture is then 50/1,000,000 = 0·00005. This amount of shrinkage could readily be caused by slight drying out, or by a decrease in temperature of only 0·00005/0·0000055 = approximately 9 deg. Fahr. A comparatively small decrease in temperature may thus produce cracking in the concrete pavement. If the tensile strength at two days is only 50 lb. per square inch, the distance between cracks, when the concrete contracts sufficiently, will be smaller than it is if the concrete cracks at a later period when it has attained higher strength. Assuming the same values for friction and weight of concrete as before, we have fLw = 50 × 72, or 1·0 × L × 72 = 50 × 72, whence L = 50, if the coefficient of friction equals 2·0. There may be times, due to a big fall in temperature just after the concrete has hardened and the tensile strength is exceedingly low, when the cracks will be much closer together than the above figures show. There are often cases when the sub-base contains projections and depressions that greatly add to the frictional resistance offered to sliding, and such a sub-base aids in the production of cracks at close intervals.

FIELD MEASUREMENTS.

In order to gain some idea of the actual changes in length which takes place in the road slab in place, many field measurements have been made by the Office of Public Roads and Rural Engineering. In general, the expansions and contractions were found to follow closely the temperature changes.

UNIFORM BEARING UNDER THE SLAB.

Irrespective of what may cause lack of uniformity of bearing under the slab, let it be assumed that, due to some cause, this unequal support exists. As an exaggerated case, let it be assumed that the slab is largely supported at its two sides, and acts therefore as a single beam. Assume a 16-ft. roadway 6 in. thick. The fibre stress in the section of greatest bending moment then equals—

$$S = \frac{Mc}{I} = \frac{WL}{8} \times \frac{6}{bd^2} = \frac{72 \times 16 \times 16 \times 12}{8} \times \frac{6}{12 \times 36} = 384 \text{ pounds per square inch}$$

This value is close to that of the modulus of rupture of the kind of concrete used in road construction.

The dead weight of the road alone is thus almost sufficient to cause cracking if the slab is afforded improper support. The same condition would hold if the pavement were supported at the sides but fully supported at the centre. Add the weight and impact of traffic to increase the bending moment due to dead load and it will be readily seen that, under the right conditions of improper subbase support, a longitudinal crack is likely to form.

Before considering these conditions producing improper support let the amount of deflection of the slab at rupture be figured. In a simple beam uniformly loaded the deflection at the centre

$$D = \frac{5}{384} \frac{WL^3}{EI}.$$

Assuming a beam 12 in. wide, and supported at its sides, the deflection under its own weight equals

$$\frac{5}{384} 72 \quad 16 \frac{(16 \quad 12^3}{3,000,000} \times \frac{12 \times 6}{12} = 0{\cdot}164 \text{ in.}$$

The slow yielding or "flow" of concrete acts to increase this by one and might even treble it, thereby making the possible deflection as much as 0·5 in. when the crack forms.

Regarding the causes of unequal bearing, nothing very definite may be said. It is generally recognised that unequal compaction of the sub-base, due to lack of homogeneity and to uniform rolling, may cause more settlement in some spots than in others, and many subbases built of old Telford or macadam roads are very likely to lack uniformity. Again, the well-known expansive effect of freezing can very readily act with different intensity in different parts of the road, thereby causing more than enough rise to produce cracking. The shrinkage of soils when they dry out, and their swelling when moistened, is an occurrence of every-day observation, and it is quite possible that the shrinkage of the foundation away from the concrete is sufficient in places to cause great bending stress, with the formation of cracks in the concrete. The raising of the sub-base in spots need not be more than 0·2 in. to cause cracking, and the expansive effect of the frost and the swelling and shrinkage effect of moisture on the sub-base may be considerably more than this. The writer now has some experiments in progress to show the effect of freezing and moisture on the vertical movement of the road.

IMPACT OF TRAFFIC.

The weight of traffic serves but to accentuate the stresses due to the other physical causes. Heavy loads on a thin slab, or where the bearing is not uniform may cause either transverse or longitudinal cracks, and when these loads are applied suddenly or with impact, as is the case with the modern heavy truck and steel-tyred trailer, these loads will aid the other causes of cracking, although they may not be severe enough to be effective themselves. Traffic, however, often breaks off the corners of slabs, the load then being concentrated near a point having poor bearing.

In conclusion, it must be emphasised that a great effort should be exerted to protect the concrete during its initial stages of hardening. Do not mix it any more than necessary to obtain smooth yet economical construction. Protect it from sudden losses of temperature and keep it wet for at least two weeks in order to prevent undue shrinkage while the concrete is young. Much attention should be given the subbase for as has been pointed out the friction at the base causes transverse cracks. This friction may be greatly reduced by proper care in the preparation of the subbase, and in this way the cracks may be greatly distributed if not entirely eliminated. In addition provide proper drainage to keep the moisture away as possible so that the effect of frost and the settlement due to moisture may be minimised. Finally design the slab as to thickness to carry the loads it is supposed to carry, irrespective of whether the subbase offers uniform bearing or not.

Liverpool City Engineer's Department and the War. The city engineer's department of the Liverpool Corporation has contributed a total of about £100 each to the funding loans. Of that number forty have now laid down their lives. The gallant record (the *Liverpool Post and Mercury* says) was a matter of comment recently at a meeting of the Health Committee when the deaths in action of three of the city engineer's former staff were regretfully reported.

AN URBAN SURVEYOR'S "SALARY."

HOW THE L.C.B. PAYS.

At the last meeting of the Aspatria, Cumberland, Urban District Council, Mr. Pennington (the *Whitehaven News* reports) moved they give an increase of £15 to the surveyor. At present he was paid £50 as inspector and £30 as surveyor. On looking into the salary and seeing the amount of work done, he felt it a disgrace to the council.

The chairman: Don't put it so strong. (Laughter.)

Mr. Pennington: Well, I never thought the salary was so small. The surveyor should have at least £2 per week.

The clerk pointed out they got half the inspector's salary from the Local Government Board. He thought they ought to apportion the salary, £10 for the inspector and £5 for the surveyor.

The medical officer: Better put it all on the inspector's salary. (Laughter.)

The clerk: I was thinking that.

The medical officer: They would not object.

Mr. Stoddart: What is the war bonus?

The clerk: 3s. per week.

Mr. Pennington: I did not take that into account, because it will probably cease with the war.

Mr. Ostle: Is it up to £2?

Mr. Pennington: Not yet.

Mr. Ostle: Level it up then.

Mr. Stoddart said he would not put it so strongly as Mr. Pennington, but £15 increase was not too much. He had great pleasure in seconding.

The chairman suggested £5 for the surveyor and £15 for the inspectorship.

Mr. Pennington agreed to this, and it was decided to give an advance of £20.

STATE CANALS.

BOARD OF TRADE TO TAKE POSSESSION.

A Regulation under the Defence of the Realm Act has been made enabling the Board of Trade to take possession during the war of any canals in the United Kingdom.

The Board of Trade are about to make an Order under the new Regulation taking possession of such of the non-railway-owned canals as are required for essential traffic. They propose to appoint an executive committee to control the canals on their behalf.

The expression "canal" in the new Regulation includes all buildings, barges, machinery, and plant used in the working of the canal.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

APPLICATIONS FOR LOANS.

Birmingham Tame and Rea District Drainage Board. £10,000 for the construction of additional sludge-drying beds.

Loughborough T.C. £27,225 for extensions at the electricity works, and £1,175, excess expenditure on the electricity undertaking.

Mansfield T.C. £490 for street improvement works.

LOANS SANCTIONED.

Dundalk U.D.C. - £3,000 for the electricity undertaking.

Kettering U.D.C. - £950 for the purchase of a motor fire engine.

INQUIRY HELD.

FEBRUARY.		£
27.	**Hoylake.** For the purchase of a motor fire engine (Mr. A. G. Drury) ...	1,100

Business Announcement. We are informed that the Woods-Gilbert (British) Rail Grinding and Milling Company, Limited, has been formed for the purpose of acquiring from the Woods-Gilbert Rail Planer Company, Limited, of Melbourne, all the assets, liabilities and goodwill of the business hitherto carried on by them in Great Britain, and they have accordingly taken more convenient premises at 170 Strand, London, W.C., to which all further communications should be addressed.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars have reached us during the present week. Other reports will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Bucks C.C.—Application is to be made to the Local Government Board for powers to establish a joint isolation hospital for the districts of Beaconsfield, Chesham, Marlow, Slough, Amersham, and Wycombe.

Grimsby T.C.—The Electricity Committee propose to build stores and a workshop in Moss-road, at an estimated cost of £60.

Hove T.C.—With respect to the purchase of the Hove baths and laundry premises, the Local Government Board write that they will not be in a position to sanction a loan at present. They suggest the holding of a local inquiry, so that in the event of the proposals being considered satisfactory a loan might be authorised when circumstances permitted.

Newton Abbot U.D.C.—The tender of Messrs. Hugh Mills & Son, at £385, has been accepted for the alteration of the stone depot in the Avenue.

HOUSING AND TOWN PLANNING.

Coatbridge T.C.—The Housing and Town Planning Committee have received authority to prepare a housing scheme for forty houses.

Killarney R.D.C.—The council are seeking to raise a supplemental loan of £3,800 for the completion of their housing scheme.

Rhymney U.D.C.—With respect to the finances of the council's housing scheme, a letter has been received from the Local Government Board stating that the council were not legally entitled to charge an increased rent in respect of their houses in the local garden city, and that whatever deficiency there might be in the rents to meet the repayment of the loan should be made up from the general district fund. A claim was made by one of the tenants for 13s. 9d., being the sum of the increased rent paid by him. In view of the letter from the Local Government Board it was decided to refund the amount.

Sedgley U.D.C.—The council have prepared a scheme, to be carried out after the war, for the provision of fifty houses for the working classes, at an approximate cost of £12,000.

MOTOR TRANSPORT.

Bucklow R.D.C.—The council have decided to purchase a 5-ton Yorkshire steam wagon and two side-tipping trailers.

Dumbarton T.C.—The town council have agreed to contribute £25 towards the purchase of a motor ambulance by the business firms of the town.

Dundee T.C.—The Police Committee have decided to purchase a motor tractor for the fire escape.

Glasgow T.C.—The Tramways Committee are inviting tenders for the supply of an electrically propelled vehicle for the department.

Kensington B.C.—The Highways Committee have been considering a proposition to make use of motor brooms for road sweeping, but, having regard to the difficulty of obtaining drivers and the high price of petrol, they have adjourned the matter for six months.

Manchester T.C.—The Government have given the necessary authority to the city council to obtain the equipment for the maintenance of the plant, motor vehicles and rolling stock used in the public health services.

Newton Abbot U.D.C.—The surveyor has been instructed to apply to the Ministry of Munitions for permission to obtain immediate delivery of a steam lorry for the cartage of road material.

Perth T.C.—The purchase of a motor refuse wagon for the cleansing department is being considered by the council.

Salford T.C.—The Lighting and Cleansing Committee recommend the acceptance of the tender of the Austin Motor Company, Limited, at £747, for a 2 3-ton tipping wagon.

Sheffield T.C.—The corporation have purchased two second-hand Commer cars, one for £260, the other for £278, for removing clinker. It has also been decided to buy two second-hand generating sets and condenser for £810, and two battery equipments for charging electric vehicles.

Walsall T.C.—It has been decided to purchase a second-hand chassis and fit it up as a motor parcel van, at a cost not exceeding £300.

Warrington T.C.—It is proposed to purchase a steam tipping wagon for the sanitary services.

ROADS AND MATERIALS.

Burntisland T.C.—A sum of £250 has been included in the estimates for tar-spraying work.

Caistor R.D.C.—The council have accepted the tenders of Messrs. Ellis & Everard, Messrs. M. Jackson & Son, Messrs. Ord & Maddison, and the Mountsorrel Company, for the granite required for the coming year, and the tender of Messrs. Atkinson & Son for slag and tar-macadam.

East Grinstead R.D.C.—The council have accepted the tenders of Messrs. Forbes, Abbott & Leonard, and Messrs. Catchpole & Son, at 3¾d. per gallon, for the supply of tar, delivered to the various stations. They have also accepted the tender of the Tar Road Syndicate, at 2 9/20d. per square yard, for tar-spraying.

Newton Abbot U.D.C.—The tender of Messrs. Fothergill Brothers has been accepted for tar-spraying, at 1 11/16d. per super. yard, on condition that the county council consent to contribute one-half the cost of the work.

Paignton U.D.C.—In commenting upon the half-year's estimate of £1,587 for road maintenance, the chairman of the Roads Committee stated that a lot of tar-spraying would be needed, and considerable expense incurred in street watering, in the event of a dry summer.

Pateley Bridge R.D.C.—The council have approved the action of the surveyor of highways, Mr. W. Storey, in offering four hand-scrapers to the War Office at 11s. each.

St. Thomas R.D.C.—It was reported that, owing to the large demand for German prisoners for labour, it was impossible to allocate any for work on the roads. The chairman, Mr. J. H. Ley, said they would probably have seventy German prisoners in that district. Arrangements were being made at Topsham for their reception. That meant that the St. Thomas Council must try to get their men from that group. He understood that only 275 had been allocated to Devon.

SEWERAGE AND SEWAGE DISPOSAL.

Alton U.D.C.—The council have been asked by the Local Government Board to submit their proposals as soon as possible with respect to the sewerage works for which they are seeking sanction to a loan of £37000.

Camberwell B.C.—The borough engineer, Mr. W. Oxtoby, has submitted a report with reference to a subsidence of the roadway in Camberwell-grove. It was found that the subsidence was caused by a stoppage in the sewer through several of the pipes having collapsed, the earth having washed away in small quantities until it reached the surface of the roadway, which then caved in. There is no doubt this had been going on very gradually for many years, as no abnormal deposits were discovered in the outlet sewers through which it must have passed. The defective portion of the sewer has been reconstructed, and a manhole been brought up to the surface of the roadway, so that the three pipes which meet at this spot will now be under constant inspection and control. The cost of the work will be about £250.

Mansfield T.C.—The War Office having taken two 200-gallon sludge carts from the corporation, and undertaken to replace them, the council decided to purchase two 250-gallon carts in their place.

WATER, GAS, AND ELECTRICITY.

Barnes U.D.C.—The chairman of the Electricity Committee and the electrical engineer have been appointed to attend a conference to be convened by the Ealing Corporation on the question of a bulk supply of electricity. A resolution has been passed by the council protesting against the demand made by

the Metropolitan Water Board for the payment by March 31st of £4,053, the council's share of the board's deficiency. It was stated that, as the council had received no prior information with respect to the matter no provision had been made in their estimate for such a sum.

Kirkcaldy T.C.—The manager of the gasworks recommends the council to extend the purifying plant.

Leeds T.C.—A deputation has been appointed to visit London and Nottingham in order to inspect briquetting and other plant for the utilisation of coal dust.

Llanelly R.D.C. An arrangement has been made with the Llandilo Rural District Council under which the latter authority will supply Tycroes with water by meter.

Monifieth T.C. The council have agreed to a recommendation of the Gas Committee that, commencing as from May 15th next, the price of gas for industrial purposes, including the ordinary 5 per cent discount for prompt payment, should be subject to an extra discount of 5 per cent when the annual consumption is between 20,000 ft. and 35,000 ft., 7½ per cent for annual consumption between 35,000 ft. and 50,000 ft., and 10 per cent above the latter figure. For the current year a total discount of 15 per cent will be allowed, irrespective of the amount consumed.

Penzance T.C.—A suggestion by the borough surveyor, Mr. F. Latham, that a large meter and fittings should be placed on one of the 12-in. water mains with a view of checking waste, has been referred to the town council in committee.

Sheffield T.C.—The Electricity Supply Committee have authorised the general manager to engage temporarily six draughtsmen and such technical assistance as may be required for the preparation of plans and specifications for the building and equipment of the new power-house at Blackburn Meadows. The committee also authorised the suggested extension of the drawing-office accommodation at Commercial-street to be carried out.

Stockport T.C. The Gas Committee have asked the engineer to prepare an estimate of the cost of installing a tar-distilling plant at the gasworks. A sub-committee have been requested to report upon the extensions to be made at the works after the war.

MISCELLANEOUS.

Lowestoft T.C. The borough surveyor, Mr. G. H. Hamby, has submitted a report on the damage done to the sea wall by storms, showing that a sum of £5,276 will be required for new works, and the town council have resolved to approach the Local Government Board with a view to obtaining a loan for that amount.

Monifieth T.C.—It has been agreed to offer the office of the burgh surveyor as a place of accommodation for the interviewing of recruits under the scheme of national service, and the matter of clerical assistance was referred to a committee to arrange.

Paignton U.D.C.—It was stated that considerable expenditure would have to be incurred to repair the damage to the sea wall, but that the council had £1,569 in hand for the work, which would more than meet the cost.

Torquay T.C. The corporation are about to reap advantage from their afforestation scheme on the watershed, arrangements having been made for the sale of a portion of the timber.

Surbiton's Electric Dust Vans.—The manufacturers are proceeding with the construction of one of the two electrically driven dust vans, for sanction to the purchase of which by instalments, Surbiton, Surrey, Urban District Council recently made application to the Local Government Board. At the last meeting it was reported that the board did not see its way clear to sanction the purchase of the two electric dust vans by means of instalments, and the alternative scheme had been adopted—*i.e.*, to purchase one vehicle for cash this year and to hire a second vehicle, on the understanding that it would be purchased by cash at the expiration of one year. The clerk stated that by direction of the chairman of the council he had written to the Local Government Board regretting that it was unable to grant the council's application, and adding that, in view of the very serious position in which the council was placed over its dust removal difficulty, it had no alternative but to secure the electric dust vans in any other way that was open to it.

PERSONAL.

Mr. E. Lynch has been appointed assistant county surveyor of Galway.

Mr. F. Dowling, B.E., has been unanimously appointed town surveyor of Ennis.

Mr. R. Curtis Corden, highway surveyor to the Bucklow Rural District Council, has been voted an increase of salary.

Mr. W. Davey, surveyor to the Brandon (Suffolk) Rural District Council, is leaving to take up Army road work in France.

Mr. M. W. Wickett, road surveyor to the Plympton Rural District Council, has obtained a commission in the Royal Engineers for road work in France.

Mr. J. W. B. Blackman, city engineer of New Westminster, British Columbia, has received a commission as Lieutenant in the Canadian Railway Construction Company.

Mr. Henry Stewart, assistant burgh surveyor of Aberdeen, has received a commission as Lieutenant in the road making corps, and the town council have agreed to make up his salary to its present figure.

Mr. W. F. Loveday, borough surveyor of Stoke Newington, has accepted a commission as Captain in the Road Construction Companies, Royal Engineers, and Mr. C. L. Strike, the assistant surveyor, has been appointed acting surveyor during Mr. Loveday's absence.

Mr. J. R. Sobey, surveyor for the Southern District of the Liskeard Rural District Council, was welcomed back recently to the council meeting after a serious illness, the chairman, Mr. M. West, stating that Mr. Sobey had missed a council meeting only once in thirty-four years.

Mr. E. A. Sandford Fawcett, deputy chief engineer of the Local Government Board, who acted as secretary of the Man-Power Distribution Board, has been appointed chief assistant to the Director-General of National Service. Mr. Fawcett will also act as principal private secretary to the Director-General.

Mr. J. Young, manager of the Newport (Mon.) tramways undertaking, and Mr. A. Nicholls Moore, electricity works manager, have had their salaries increased from £400 to £500; Mr. W. T. Bond, waterworks department, from £275 to £300; and Mr. T. Leveson, waterworks department, from £130 to £150.

Mr. W. W. Gladwell, who has held, at a salary of £300 a year, the office of county surveyor of Norfolk temporarily since the death of Mr. Heslop, is recommended for the permanent position by the Western Highways Committee, at a salary of £400, rising to £500. The proposition has to be confirmed by the county council.

Mr. Peter Fyfe, chief sanitary inspector of Glasgow, gave a lecture, entitled "A Tour in the Calton," at the Old Glasgow Club, last week. For sanitary and housing purposes he advocated dealing with the city in sections. This, he said, was the basic principle of the housing scheme proposed by the town clerk, Sir John Lindsay.

Mr. George Green has been appointed by the Wantage Urban District Council to carry out the duties of surveyor during the absence of Mr. T. C. Betts on military service. Mr. Green, who will be paid £70 a year, has received a vote of thanks from the council for voluntary service during the past month.

Mr. W. G. Peirce, who has for over forty years been water engineer under the Richmond (Surrey) Town Council and their predecessors the Richmond Vestry, has resigned, owing to advanced age, but his services are to be retained as consulting engineer from April 1st next at an annual salary of £250. The Water Committee recommended, in addition, "with residence," but this was not carried.

Mr. J. Siddalls, borough surveyor of Tiverton, and his staff, were congratulated recently at the town council meeting by Alderman Deering, chairman of the Streets Committee, on the manner in which they have during the past two years carried through their duties, under difficulties, with a diminished staff. The town, he said, had been well kept, and it was due to them that this testimony should go forth. Every eligible member of the borough surveyor's staff, both outdoor and office, are on active service,

no less than 80 per cent having joined up, either in the Army or in the Labour Battalions.

Mr. Charles T. Ruthen, who has been selected, in conjunction with Mr. Leonard R. Powell, J.P., to fill the position of honorary inspector to inquire into the utilisation by the Government Departments of their office accommodation, is a well-known Swansea architect and arbitrator. The appointment has been made by the Accommodation Committee, of which Sir Alfred Mond, as First Commissioner of Works, is chairman. Mr. Ruthen, who is forty-five years of age, is a native of South Shields, and after serving his articles as architect and surveyor in that town he went to Swansea in 1890 as assistant in the borough surveyor's office. Six years later he started in practice in the town, and since then has been engaged in many works of the first magnitude, including the buildings named above. He is one of the pioneers of a comprehensive, broad idea in the treatment of the important subject of housing in South Wales. During the past few years the bulk of his time has been occupied in arbitrations.

KILLED IN ACTION.

Private Frank Cross, of the Royal Fusiliers, who was articled to Mr. John Brooke, surveyor to the Northwich Urban District Council, has, we regret to state, been killed in action.

Mr. Alexander Hogg, county road surveyor, Elgin, has received intimation that his son, Second-Lieutenant David A. Hogg, Highland Light Infantry, was killed by a shrapnel bullet on the 9th inst. Second-Lieutenant Hogg was road surveyor of the County of Zetland, and joined the Sportsmen's Battalion shortly after the outbreak of war. He received a commission in the Highland Light Infantry after the capture of Delville Wood.

OBITUARY.

Mr. John R. Smart, who was for many years identified with the Dundee city water supply in the capacity of Inspector, died recently, we regret to state, aged about sixty.

The death has occurred, after a short illness, of Mr. Tom Rudd, senior partner in the well-known Carlisle firm of bowling-green experts, who have laid sea turf greens for municipal bodies and private clubs in all parts of Great Britain. He was only forty-five years of age.

See End of Paper.

SEVENOAKS RURAL DISTRICT COUNCIL.

TENDERS FOR MATERIALS, TEAM LABOUR, &c., IN CONNECTION WITH THE REPAIR OF HIGHWAYS.

YEAR ENDING 31ST MARCH, 1918.

The Rural District Council of Sevenoaks invite Tenders for

(1) The Supply of Chert, Flints and Ragstone on to the various Roads in the District. (2) The Supply of Granite, Quartz, &c., Basalt, or other approved Hardstone, to various Stations in the District. (3) Team Labour and Cartage. (4) Haulage from Stations and Quarries, for the year ending 31st March, 1918.

Specifications, Conditions of Contract, Schedule of Quantities, with Form of Tender, may be obtained on application at my Office, or from Mr. R. Bailey, Sundridge, Sevenoaks, and Mr. J. Randerson, Leigh, Kent, Surveyors to the Council. Persons applying for Form should state which they require.

The Council do not bind themselves to accept the lowest or any Tender, and they reserve to themselves the right to accept such part of any Tender as they may deem proper.

Samples of Materials to be delivered, carriage paid, at this Office, Sevenoaks, and Sealed Tenders, marked "Tenders" on the outside of the envelope, to be returned, with the conditions intact, to me, on or before Saturday, the 10th March, 1917.

(By order of the Council)
F. H. VIBERT,
Clerk to the Council.

Bank Chambers,
82 High-street, Sevenoaks.
February 21, 1917. (3,323)

HARROW-ON-THE-HILL URBAN DISTRICT COUNCIL.

The above Council invite Tenders for:—

(a) The Supply of about 30,000 gallons of Distilled Tar, delivered in barrels to the Harrow Metropolitan Station.

(b) Tar Painting about 40,000 sq. yards of Road Surface. The Tar supplied under Contract (a), and that used under Contract (b) to comply with the Road Board Specification.

Endorsed Tenders to reach me on or before Saturday, March 3, 1917.

The lowest or any Tender will not necessarily be accepted.

JOHN STRACHAN,
Clerk.

Council Offices,
Harrow,
February 20, 1917. (3,325)

AYLESBURY RURAL DISTRICT COUNCIL.

TENDERS FOR MATERIALS

The Highways Committee of the Aylesbury Rural District Council invite Tenders for the Supply of Materials for the Maintenance of their Highways during the year ending March 31, 1918, approximately as follows:—

Granite, 2,350 tons; Furnace Slag, 600 tons; and Derbyshire Limestone, 300 tons.

Also 4,000 gallons of Refined Tar (to comply with Road Board Specifications), to be delivered to Stoke Mandeville Station (G.C.R.).

Forms of Tender and particulars may be obtained upon application to the undersigned, which must be delivered not later than first post Wednesday, March 14th, 1917.

H. G. CORDON, Highway Surveyor.

Council Offices,
21 Walton-street,
Aylesbury.
February 21, 1917. (3,326)

HORSHAM RURAL DISTRICT COUNCIL.

The above Council are prepared to receive Tenders for the Supply of the following Materials, for the year ending March 31st, 1918:—

Flints, 2,000 cubic yards,
Granite, 1,500 cubic yards.
Granite Chippings, 500 cubic yards.
Sand for use in Tar-dressing Roads, 200 cubic yards.

All particulars and Forms of Tender to be obtained of the Surveyor, Mr. W. Dengate, 58, Park-street, Horsham.

The Council do not bind themselves to accept lowest or any Tender.

Tenders, endorsed "Materials," to reach me, the undersigned, not later than Saturday, March 17th.

By order,
F. FRASER HADDOCK,
Clerk.

9, Carfax,
Horsham.
February 20, 1917. (3,324)

GELLYGAER URBAN DISTRICT COUNCIL.

TEMPORARY SURVEYOR'S ASSISTANT.

The above Council require a Temporary Assistant (not being eligible for military service) in their surveyor's office during the period of the war. Candidates should be neat draughtsman, able to make accurately small surveys, and preferably have had experience in a municipal office. Salary £120 per annum. Candidates who canvass any of the members of the Council will be disqualified.

Applications, stating age and experience, and enclosing copies of three recent testimonials, should be sent to me not later than 2nd March, 1917.

FRANK T. JAMES,
Clerk.

Council Offices,
Hengoed, Glam. (3,322)

SURVEYOR will undertake the tracing of Plans and Drawings, also Colouring. Reasonable charges.—Write Box 1,603, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (3,327)

BEDWAS AND MACHEN. March 2nd.—For the supply of ballast, metalling, and lamp oil, for the urban district council.—Mr. A. S. V. Taylor, Council Offices, Bedwas.

CHESTERTON.—March 3rd.—For the supply of about 5,000 tons of broken granite, for the rural district council.—Mr. J. Dunn, surveyor, Brunswick House, Cambridge.

DRIFFIELD.—March 3rd.—For the supply of 6,500 tons of whinstone and granite, 2,000 tons of broken slag, 500 tons of sea cobbles, and 300 tons of sea gravel for the rural district council.—Mr. T. C. Beaumont, surveyor, Driffield.

DURHAM.—March 3rd.—Tenders are invited for a second-hand No. 1 Smith hot-mixer plant for the making of tar-macadam. Mr. Albert E. Brookes, county surveyor, Shire Hall, Durham.

SIBSEY. March 3rd. For the supply of granite, slag, slag dust and chips, for the rural district council.—Mr. J. M. Simpson, clerk, 28 Wide Bargate, Boston, Lincs.

SOUTHWELL. March 5th. For the supply of road materials, for the rural district council.—Mr. J. Ellis, clerk, Southwell.

HUNSLET.—March 5th.—For the supply of highway material, for the rural district council.—Mr. W. B. Pindar, clerk, Leak-street, Hunslet, Leeds.

LOUGHBOROUGH.—March 5th.—For the supply of broken granite, for the corporation.—Mr. A. H. Walker, borough surveyor, Town Hall, Loughborough.

NEWMARKET.—March 5th.—For the supply of 3,000 tons of 2½-in. best broken Leicestershire granite, 3,750 tons of 1½-in., and 170 tons of granite chippings, for the rural district council.—Mr. F. J. Blackbourn, acting clerk, Deva-chambers, Newmarket.

HORNCASTLE.—March 5th.—For the supply of 260 tons of X granite, 300 tons of XX granite, 150 tons of X slag, and 70 tons of slag or granite chips, for the urban district council.—The acting surveyor, Court House, Horncastle.

SUNBURY-ON-THAMES.—March 5th.—For the supply of 500 tons of Guernsey, Clee Hill, Burdon Hill, or Charnwood granite, and 300 tons of slag tar macadam, for the urban district council.—Mr. H. F. Coales, surveyor, Council Offices.

WEST SUFFOLK.—March 6th.—For the supply of broken material (tarred and untarred), for the county council.—Mr. T. W. Morgan, acting county surveyor, Shire Hall, Bury St. Edmunds.

BLYTHING.—March 7th.—For the supply of 5,500 tons of granite, granite chips and flints, for the rural district council.—Mr. H. A. Mullens, clerk, Council Offices, Bulcamp, Halesworth.

STROOD.—March 7th.—For the supply of Guernsey granite spalls, broken Guernsey and other granites, quartzite, and basalt, Kentish rag, surface-picked and grubbed flints, local pit flints, and dehydrated tar, for the rural district council.—Mr. J. E. Povey, clerk, Council Offices, Stroud.

DURHAM.—March 10th.—For the supply of broken whinstone, broken limestone, broken slag, rough slag, tarred slag, tarred limestone, distilled and prepared tar, tools, team labour, cartage, and sanitary pipes, for the county council.—Mr. A. E. Brookes, county surveyor, Shire Hall, Durham.

SHEPTON MALLET. March 10th. For cleansing the highways, street watering, steam rolling and scarifying, and the supply of road materials, for the urban district council.—The Acting Surveyor, Council Offices.

BUCKLOW.—March 12th.—For the supply of granite setts, grit setts, broken granite and slag, chippings, cinders, road grids, tools, and paving, for the rural district council.—Mr. R. Curtis Corden, highway surveyor, Knutsford, Cheshire.

LEAMINGTON.—March 12th.—For the supply of about 2,500 tons of road stone, for the corporation. The road surveyor, Adelaide-road Depot, Leamington.

WALSALL.—March 13th.—For the supply of broken furnace slag, broken granite, and stoneware pipes, for the rural district council.—Mr. W. P. Young, district surveyor, Council Offices, Daw End, Rushall, Walsall.

ST. HELENS.—March 17th.—For the supply of macadam, granite chippings, limestone chippings, granite setts, kerbs, channels, grit setts, concrete flags, sand and tarred macadam, for the corporation. —Borough Engineer, Town Hall, St. Helens.

KIVETON PARK. March 17th.—For the supply of broken slag, granite, and tar macadam, for the rural district council.—Mr. F. Hewitt, surveyor, council offices, Kiveton Park Station, near Sheffield.

EPSOM.—March 19th.—For the supply of granite chippings, dug flints, fine gravel, sand, stoneware pipes, and team labour, for the rural district council. —Mr. T. E. Ware, surveyor, Waterloo-road, Epsom.

CHAILEY.—March 22nd.—For the supply of about 2,980 yds. of flints, 2,550 yds. of granite or other stone, and 60 yds. of gravel, for the rural district council.—Mr. C. Patrick, clerk, Union Offices, West-street, Lewes.

GAINSBOROUGH.—For the supply of between 7,000 and 8,000 tons of whinstone and about 500 tons of slag, for the rural district council.—Mr. R. Maxwell, surveyor, Lea-road, Gainsborough.

EAST ELLOE.—For the supply of granite slag and gravel, for the rural district council.—Mr. S. S Mossop, clerk, West End, Holbeach.

Sanitary.

WAKEFIELD. — February 26th.—For work of public scavenging, for the rural district council.—Mr. W. Druce, clerk, Tetley House, Wakefield.

SMALLTHORNE.—February 28th.—For scavenging the Packmoor area, for the urban district council.—The Sanitary Inspector, Smallthorne, Staffs.

BARNSLEY.—March 1st.—For scavenging and bell cart work, for the rural district council.—Mr. D. Thompson, sanitary inspector, 17 Regent-street, Barnsley.

REPTON.—March 1st.—For emptying dustpits and closets, for the rural district council.—Mr. C. F. Chamberlain, clerk, Union Offices, Burton-on-Trent.

BARNSLEY.—March 1st.—For scavenging the parish of Carlton, for the rural district council.—Mr. D. Thompson, sanitary inspector, 17, Regent-street, Barnsley.

LLANDAFF.—March 1st.—For the construction of 400 yds. of 9-in. and 18-in. earthenware and cast-iron pipe sewers, with manholes, for the rural district council.—Mr. J. Holden, engineer, Park House, 20 Park-place, Cardiff.

GAINSBOROUGH.—March 3rd.—For the supply of stoneware and earthenware pipes, gullies and cast-iron pipes, for the urban district council.—Mr. S. W. Parker, engineer and surveyor, 6 Lord-street, Gainsborough.

NEWCASTLE-ON-TYNE.—March 5th.—For the removal of house refuse, for the corporation.—Acting City Engineer, Town Hall.

BEDLINGTON.—March 5th.—For the removal of the contents of privies and ashpits, for the urban district council.—Mr. J. E. Johnston, surveyor, Council Offices.

LLANDAFF AND DINAS POWIS.—March 7th.—For horsing scavenging wagons and removing house refuse, for the rural district council.—Mr. M. Warren, clerk, Park House, 20, Park-place, Cardiff.

HOWDEN.—March 8th.—For scavenging, for the rural district council.—Mr. H. Green, clerk, Howden.

WEST HAM.—March 8th.—For the supply of disinfectants, for the Education Committee.—Town Clerk, 95, The Grove, Stratford.

ALNWICK. March 12th. For cleansing ashpits and carting ash-box refuse, for the rural district council. Mr. H. W. Watson, clerk.

CAERPHILLY. March 20th. For scavenging in various districts, for the urban district council.—Mr. T. H. Richards, surveyor.

Stores.

MALDEN AND COOMBE.—February 26th. For the supply of bricks, flints, granite, fine gravel, tar-macadam, tar paving, Portland cement, brooms, brushes, manhole covers, gully gratings, pitch, creosote oil, distilled tar, paints, colours, leads, varnishes, oils and stoneware, for the urban district council. Mr. James W. Johnson, clerk, Council Offices, New Malden, Surrey.

WHITEFIELD.—February 26th.—For the supply of granite macadam, setts, chippings, kerbs, flags, disinfectants, earthenware pipes, and ironwork, for the urban district council.—Mr. G. M. Denton, engineer and surveyor, Whitefield.

EXETER.—March 1st.—For the supply of bricks, cast blocks and existing stocks of sweeping machines, Portland cement, building lime and slates, cast-iron pipes, granite channelling, kerb and setts, Yorkshire flags, concrete flags, painting and paperhangers' work, stoneware pipes, miscellaneous iron castings, slate and sand, timber (foreign and English), ironmongery, oils, plumbers' materials and labour, asbestos goods, and manure or baskets, for the corporation.—Mr. Thomas Moulding, city engineer and surveyor, Municipal Offices, Exeter.

SURBITON.—March 1st.—For the supply of material and execution of various works during the year 1917-18.—Mr. F. W. Wood, clerk to the urban district council.

CLITHEROE.—March 3rd.—For the supply of wrought iron, steam tubes and fittings, ironmongery, lime, team labour, disinfectants, limestone, earthenware pipes, street gates, brushes, mortar, granite, flags, setts, pitch, and oil, for the corporation. The Borough Surveyor.

CHARDLE.—March 3rd.—For the supply of labour on highways, granite and other tar-macadam, broken granite for macadam, artificial stone flags, kerbs, setts, flags, earthenware pipes and other earthenware materials, Portland cement, disinfectants and oils, for the urban district council.—Mr. F. D. Barton, acting surveyor.

SOUTH SHIELDS.—March 3rd.—For the supply of Northumberland whinstone, Frieshire whinstone, Aberdeen and Norwegian granite, slag, granite chippings, Caithness flags, Portland cement, cement concrete flags, cast ironwork, shovels, scavenger brooms and machine brooms, coal, coke, disinfectants, leather hose, sewer boots, jackets, sanitary pipes, paints, paint oils, glass, timber, iron, horseshoe nails, cart axles, springs, tar, pitch, oils, and general stores for the corporation. The Borough Engineer, Municipal Buildings, South Shields.

BIDDULPH.—March 5th.—For the supply of 2,400 tons of coal, 120 tons of white lime, limestone for chilling and gravel, and basalt metalling and gravel, for the urban district council.—Mr. Dan H. Price, engineer and surveyor, Aberbargoed.

COLCHESTER.—March 7th.—For the supply of Derbyshire stone, lime, granite kerbing, granite setts, broken granite, Kettering iron slag, tar-macadam, tucker, kentish ragstone, Kentish sifted red flints, Portland cement, glazed stoneware sewer pipes, junctions, bends, traps, taper pipes and gratings for the corporation.—Mr. H. Collins, borough engineer and surveyor, Town Hall, Colchester.

EAST HAM.—March 9th.—For the supply of glazed stoneware pipes, glazed stoneware gully fitting, Lincoln pressed and other bricks, Thames-ballast, coal and coke, broken granite, crushed granite, granite setts, Guernsey and other granite chipping, granite kerb and channelling, broken flint, cast iron gully gratings, shovels, brooms, picks and barrows, disinfectants, oilskins, hire of horses and carts, costume of jeans, uniforms, sewer ventilating [illegible] smocks, veterinary attendance, provender, [illegible] and repair of street lamps, [illegible] removal of tinware from [illegible] and refreshing of setts, for the corporation.—Mr. C. L. Pace Wilson, town clerk, Town Hall, East Ham, E.

BUXTON.—March 10th.—For the supply of paving setts, flag setts, Derbyshire basalt macadam, tarred limestone chippings and lump lime, Portland cement, earthenware pipes, disinfectants, castings, cast ironwork, shovels, picks, ironmongery, [illegible] pitch and refined tar, for the corporation.—Mr. E. F. Deville, borough engineer, Town Hall, Buxton.

DURHAM.—March 10th.—For the supply of broken whinstone, broken limestone, broken slag, rough slag, tarred slag, tarred limestone, distilled and prepared tar, tools, team labour and cartage, and sanitary pipes, for the county council.—Mr. Albert E. Brookes, county surveyor, Shire Hall, Durham.

DERBY.—March 12th.—For the supply of bricks, cement, lime, disinfectants, earthenware, freestone, gritstone, granite, gravel, sand, limestone, pitch, tar and slag, for the corporation.—Mr. John Ward, borough surveyor, Babington-lane, Derby.

HEYWOOD.—March 17th.—For the supply of setts, kerbs (local stone), flags (local stone), earthenware pipes, bends, junctions, taper pipes, traps, gullies, pitch, creosote oil, limestone chippings (white), hand-broken granite and granite chippings, and Portland cement (British standard specification), for the corporation.—Mr. J. B. Nuttall, borough surveyor, Municipal Offices, Heywood.

Miscellaneous.

BATTERSEA.—March 5th.—For the supply of good, strong, well-conditioned cart horses, from the 31st March next, the council to stable, shoe, and keep the horses, for the borough council.—Mr. W. Marcus Wilkins, town clerk, Town Hall, Battersea, S.W.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

* **Accepted.** † **Recommended for acceptance.**

LONDON.—In each of the following cases the first-named tender has been accepted by the London County Council Main Drainage Committee.

North Woolwich Pumping Station: Supply of Pump Grids and Valves.—Seagers, Limited, Dartford, £75; J. Cochrane, Barrhead, £92; Clayton, Goodfellow & Co., Limited, Blackburn, £95; Hathorn, Davey & Co., Limited, Leeds, £134.

Rising Main at North Woolwich: Supply of Pipes for Repair.—Holwell Iron Company, Limited, Melton Mowbray, £8 10s. a ton (carriage extra); Stanton Ironworks Company, Limited, Nottingham, £8 15s.; Staveley Coal and Iron Company, Limited, Chesterfield, £8 15s.

North Woolwich Pumping Station: Sale of Scrap Iron.—C. A. Robinson & Co., East Greenwich, S.E., £3 5s. a ton; T. W. Ward, Limited, Silvertown, E., £3; G. Cohen, Sons & Co., Commercial-road East, E., £2 17s. 6d.; E. J. Webster, Marshgate-lane, E. (for cast scrap), £2 17s. 6d.; (for burnt scrap), £2.

Southern Outfall: Removal of Screen Refuse.—J. Gittings, Plumstead, S.E., 1s. a ton; F. and P. Showler, Abbey Wood, 1s. 6d.

Southern Outfall: Supply of Bolts and Washer-plates for Repairs to Pier.—F. W. Cotterill, Limited, Darlaston, £42 16s.; Wilkes, Limited, Darlaston, £39; Bayliss, Jones & Bayliss, Limited, Wolverhampton (not to specification), £31 5s. (less 2½ per cent).

North Woolwich Pumping Station: Supply of Steelwork for Pump Platform in Silt Pits.—Measures Brothers, Limited, Southwark, S.E., £28 19s. 6d.; H. Young & Co., Vauxhall-cross, S.E., £39 10s.; Flavell & Churchill, East Greenwich, S.E., £41 10s.

SUNBURY-ON-THAMES.—For the supply of about 10,000 gallons of refined tar, for the urban district council.—Mr. H. F. Coales, surveyor.

	Per gallon.
Grindley & Co., Limited, London, E.	5d.
R. S. Clare & Co., Limited, Liverpool	4 5/16d.
Road Supply Company, London, S.W.	3 9/10d.
E. Catchpole & Sons (London), Limited, London, S.E.	3⅝d.
Gas Light and Coke Company, London, E.C.	3⅜d.
Forbes, Abbott & Leonard, Limited, London, E.C.	3⅜d.
F. G. Holmes & Co., Northfleet	3⅜d.
Robinson Brothers, Limited, Birmingham	3⅜d.
T. Clayton (Oldbury), Limited, Brentford	3⅜d.

TRING.—Accepted for the supply of blast-furnace slag, granite chippings, refined tar, flints, and hoggin, for the urban district council.—Mr. S. S. Gettings, surveyor.

Holwell Iron Company, Limited, Asfordby.—2-in. slag, 8s. 10d. per ton; 1-in. slag, 8s. 7d.; slag chippings, 9s. 1d.

Boyce & Son, Paddington.—River flints, 5s. 6d. per ton.

Kempson & Co., Limited, Alfreton.—Refined tar, 3⅜d. per gallon.

FORTHCOMING MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

FEBRUARY.

24. Institution of Municipal and County Engineers.—South Wales District Meeting at Neath.

MARCH.

24. Town Planning Institute.—Mr. W. Rees Jeffreys on "Road Construction and Improvements by Means of Town Planning Schemes." 6 p.m.

31. Institution of Municipal and County Engineers.—North-Eastern District Meeting at Spennborough.

APRIL.

7. Institution of Municipal and County Engineers.—Eastern Sub-District (Suffolk, Norfolk, and Cambridge) Meeting at Beccles.

APPOINTMENTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

REQUIRED, an experienced fully qualified Engineer, capable of supervising and carrying through road making, surveying estates' water supplies, dramage, buildings, transport arrangements, erection of machinery, and all engineering, surveying and constructional work required in the development of large rubber estates in the Malay Peninsula. Good salary and generous treatment will be given to a really capable, first-class man whose knowledge, experience and ability would fit him for such a post. Apply, in first instance, with full particulars, in strictest confidence, to Box No. 7,996, c/o A. J. Wilson and Co., Ltd., 154, Clerkenwell-road, London, E.C. (3,301)

CITY OF SALISBURY.
CITY SURVEYOR'S TEMPORARY ASSISTANT.

The Town Council invite applications from men ineligible for military service for the appointment of a Temporary Assistant in the Office of their City Engineer and Surveyor, in consequence of the absence of the present Assistant on Active Service.

Applicants must have had experience in a Municipal Engineer's Office.

The appointment to be determinable by a month's notice.

Applications, in candidate's own handwriting, stating age, experience, salary required (the salary previously paid to the Temporary Assistant being at the rate of £104 per annum), when able to commence duties, and accompanied by copies of not more than three recent testimonials, to be sent immediately to the City Engineer and Surveyor, Salisbury.

FRANCIS HODDING,
Town Clerk.

Municipal Offices,
Salisbury.
February 20, 1917. (3,316)

MISCELLANEOUS.

WANTED to Purchase, 2 New or Second-hand Water Carts for Street Watering. Capacity about 250 gallons. Full particulars and price should be sent to Surveyor, Court House, Horncastle, before Monday, 5th March prox. (3,319)

TENDERS WANTED.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

CITY AND COUNTY OF THE CITY OF EXETER.

The Exeter City Council invite Tenders for the Supply and Delivery of the following Goods for a period of one year, ending 31st March, 1918.—

1. Bricks.
2. Bass Brooms and refilling stocks of sweeping machines.
3. Portland Cement.
4. Building Lime and Slates.
5. Cast-iron Pipes.
6. Granite Channelling, Kerb and Setts.
7. Yorkstone Flags.
8. Concrete Flags.
9. Painting and Paperhangers' Work.
10. Stoneware Pipes.
11. Miscellaneous Iron Castings.
12. Stone and Sand.
13a. Timber (Foreign).
13b. Timber (English).
14. Ironmongery.
15. Oils.
16. Plumbers' Materials and Labour.
17. Asbestos Goods.
18. Maunds or Baskets.

Printed Schedule, Specification and Form of Tender can be obtained on application to Mr. Thomas Moulding, M.INST.C.E., City Engineer and Surveyor, Municipal Offices, Exeter.

Tenders may be submitted for all or any of the Articles required, and the Council reserve the right to accept a portion of a Tender only.

Sealed priced-out Schedules, endorsed with the heading to which the Tender applies, must be sent to the Town Clerk, Municipal Offices, Exeter, before 10 a.m. on Thursday, the 1st March, 1917.

The lowest or any Tender will not necessarily be accepted.

(3,321) H. LLOYD PARRY, Town Clerk.

CAMBRIDGESHIRE COUNTY COUNCIL.
TENDERS FOR STEAM ROLLING.

The above Council invite Tenders for the Hire of Steam Rollers for use on the main roads during the year ending March 31, 1918.

Particulars and Forms of Tender may be obtained from, and Tenders are to be delivered on or before year ending March 31, 1917, to

H. H. DUNN,
Acting County Surveyor.

County Hall, Cambridge. (3,310)

EAST HAM CORPORATION.
ANNUAL SUPPLIES.

The East Ham Corporation invite Tenders for the after-mentioned Supplies and for executing the following Work, for—

(1) A period of 6 months, ending 30th September, 1917, and alternatively,
(2) A period of 12 months, ending 31st March, 1918:—

Glazed Stoneware Pipes.
Glazed Stoneware Gully Fittings (London Make).
Portland Cement.
Grey Stone, Chalk, and Blue Lias Lime.
Stock and other Bricks, &c.
Thames Ballast, Sand, &c.
Coal and Coke.
Broken Granite.
Crushed Granite.
Granite Setts.
Guernsey and other Granite Chippings.
Granite Kerb and Channelling.
Broken Flints.
Cast-iron Work, Gullies, &c.
Shovels, Brooms, Picks and Handles.
Disinfectants.
Oilskins.
Hire of Horses and Carts for Watering Streets.
Hire of Horses and Carts for General Cartages.
Hire of Horses and Carts for Scavenging.
Hire of Horses and Carts for Collection of House Refuse.
Cartage of Lime.
Uniforms for Firemen, &c.
Uniforms for Tramway Employees.
Sewer Ventilating Columns.
Boots, Sewer Smocks, &c.
Veterinary Attendance on and Shoeing Horses.
Provender.
Reglazing and Repair of Street Lamps.
Creosoted Deal Wood Blocks.
Removal of Tinware from Destructor Works.
Redressing of Setts (Labour only).

Particulars and Forms of Tender may be obtained upon application at the Offices of the undersigned, or by forwarding an addressed envelope (foolscap size), duly stamped.

The person or persons whose Tender is accepted will be required to observe and fulfil the obligations upon Contractors specified in the Fair Wages Resolution adopted by the House of Commons on the 10th March, 1909, which is fully set forth in the Form of Tender, and to enter into a Contract with a Bond for the due performance thereof.

Tenders to be delivered addressed to His Worship the Mayor, Town Hall, East Ham, E., and endorsed according to the supply or work tendered for, not later than 12 o'clock noon of Friday, 9th March, 1917.

The Corporation does not bind itself to accept the lowest or any Tender.

(By order)
EUSTACE WILSON,
Town Clerk.

Town Hall,
East Ham, E.
February 21, 1917. (3,320)

DURHAM COUNTY COUNCIL.

AUCKLAND AND CHESTER MAIN ROAD DISTRICT.

TENDERS FOR MATERIALS

The Works Committee invite Tenders for the Supply of the undermentioned Materials, Stores, Steam, Rolling and Tractor Hire, &c., for the year ending 31st March, 1918:—

(1) Broken Whinstone
(2) " Limestone
(3) " Slag
(4) Rough Slag
(5) Tarred Slag and Tarred Limestone
(6) Distilled and Prepared Tar.
(7) Tools.
(8) Team Labour and Cartage.
(9) Sanitary Pipes.

Tenders are invited for the Hire of Steam Rollers and Steam Tractor Hauling Plants for use in the County where the roads are directly maintained by the County Council.

Specifications and Form of Tender for any of the above may be obtained on application to the undersigned, to whom sealed Tenders, suitably endorsed, are to be delivered on or before March 10th, 1917.

The Council do not bind themselves to accept the lowest or any Tender.

ALBERT E. BROOKES,
County Surveyor.

Shire Hall, Durham.
19th February, 1917. (3,302)

CHESTERTON RURAL DISTRICT COUNCIL.

CONTRACTS FOR GRANITE.

The Council will, at their meeting to be held at the Board Room, at Chesterton, on Thursday, the 8th day of March next, receive Tenders for about 5,000 tons of Broken Granite.

Persons willing to Contract are requested to send their Tenders (sealed up) to my Office before 6 o'clock p.m. on Saturday, the 3rd March next.

The Council do not bind themselves to accept the lowest or any Tender.

Forms of Tender may be had upon application to the Surveyor, Mr. J. Dunn, Brunswick House, Cambridge.

No Samples to be sent.

(By order)
JOHN F. SYMONDS,
Clerk.

9 Benet-street,
Cambridge.
February 20, 1917. (3,317)

URBAN DISTRICT COUNCIL OF HORNCASTLE.

ROAD MATERIAL.

The above Council invite Tenders for Supplying the following Road Material, viz.:—

260 tons (more or less) of X Granite.
300 tons (more or less) of XX Granite.
150 tons (more or less) of X Slag.
70 tons (more or less) of Slag or Granite Chips.

To be delivered at Horncastle Station as and when required by the Council's Surveyor (the Contract to be completed by 31st October next, and security for the due performance thereof must be given).

Small Samples to be sent to the Acting Surveyor, Court House, Horncastle.

Forms of Tender can be obtained from the undersigned.

The Council do not bind themselves to accept the lowest or any Tender.

Tenders, marked "Road Material," must be delivered to me not later than 2 p.m. on Monday, 5th March prox.

(By order)
R. W. CLITHEROW,
Clerk to the Council.

Court House, Horncastle.
February 20, 1917. (3,318)

ROAD MAKING.

REINFORCE CONCRETE ROADS WITH
EXPANDED METAL.

EXMOUTH ESPLANADE WORKS. Expanded Steel Concrete Slope and Roadway. Length 1 mile. Total width of Roadway, 65 feet. Mr. SAMUEL HOUSE, Urban District Council Engineer and Surveyor.

THE EXPANDED METAL COMPANY, LIMITED
(Patentees and Manufacturers of Expanded Metal).
Head Office: YORK MANSION, YORK STREET, WESTMINSTER, LONDON, S.W.
Works: STRANTON WORKS, WEST HARTLEPOOL.

The Surveyor

And Municipal and County Engineer.

Vol. LI. MARCH 2, 1917. No. 1,311.

Minutes of Proceedings.

State Canals. The announcement that an Executive Committee, with Sir Maurice Fitzmaurice as chairman, has been appointed to control the canals which are required for essential traffic is of considerable interest. The causes which have led to the canal system of this country falling into comparative disuse are various. As to the fact, however, there can be no doubt. When the canal system was originally instituted great hopes were held of its successful development. The origin of the canal system lay in the bad condition of the old highways of the country, which constituted the sole means of transport for commerce in the early days. They were made with a distinct view to economy in initial outlay, and without any real foresight as to the ultimate demands of the country, the commercial development of which was at that time proceeding with extraordinary rapidity. Two factors in the main led to arrest their development. In the first place there was the great work of Macadam, in connection with improvements in road construction, and in the second place there was the advent of railways. As originally designed, the canals were intended to meet local needs rather than to provide facilities for long-distance traffic. The consequence was that they were made of narrow width, and in a manner totally inadequate to meet the demands which the rapidly increasing commercial prosperity of the country might place upon them. In spite, however, of all the neglect and discouragement from which they have suffered, they are still able to deal annually with over 10,000,000 tons of traffic, producing a revenue of considerably over £2,500,000. The extraordinary pressure put upon the railways in consequence of the war has forced to the front the problem of canal improvement, which, even in the pre-war period, was of pressing national importance. There can be no doubt that, even with all the limitations of our existing canal system, it can be rendered much more effective to national purposes by organised control, and it is for this purpose that Sir Maurice Fitzmaurice's committee has been appointed.

Chief among the difficulties in using the canals for national traffic are the large number of locks, necessitated by differences in level, and the number of tunnels, which had to be provided owing to the same cause. Systematic widening and improvement would be an enormously costly business, and would occupy far too much time to be adopted as a war emergency measure. The immediate problem is rather to devise some means for utilising to the best advantage the canals as they exist. The Order appointing the committee deals in terms only with canals other than those owned by railways. We are not clear as to whether this includes those canals which, though not owned by railway companies, are controlled by them. With the development of the railway system a desire naturally arose on the part of the railway companies to do away with the competition of canals, and for this purpose they have obtained control of many canals usually by means of an agreement providing for a guaranteed dividend to the canal companies. It is obvious that this device results in a slackening of effort on the part of the canal companies to make the best use of their undertakings, and, indeed, this was the avowed object of many of the agreements. While therefore we are uncertain as to whether these canals will come under the jurisdiction of the committee, we hope in the national interest that this is the case. Be this as it may, the appointment of the committee, like the temporary nationalisation of the railway systems, will probably have consequences of a permanent nature, and will not be limited in its effect to the period of war.

* * *

Officials after the War. Among the many services that have been rendered to the general body of local government officials by Sir Homewood Crawford, the City solicitor, not the least is the appointment—for which he was responsible—of the committee to consider the effect of the war upon local government officials generally. It may be within the recollection of our readers that in December last Sir Homewood convened a conference to consider this important subject. The services that have been rendered to the country in these critical times by local government officials both in the field and at home are well known, and the primary object of the conference was to make suggestions for securing that those who have left their appointments temporarily shall in no way be prejudiced by the fact of their having answered readily the call of duty. As a result of the first meeting of the conference, a sub-committee was appointed to consider the views expressed and to report. A few days ago a second conference met, and considered the report of the committee. A number of resolutions were passed, and, generally, there can be little doubt that they will meet with the approval of all local government officials. The

first of the resolutions is probably also the most important. It was to the effect that it is of the utmost importance that all local government officials who have been absent on duty in his Majesty's Forces shall be reinstated in the employment which they previously held, with any promotion and increase of salary to which they would have been entitled if they had stayed in their civil employment, and that no temporary substitutes should be permitted to exclude or take precedence over them. Most local authorities have already provided, in part at all events, for carrying out the terms of this resolution. A point of difficulty lies in providing for promotion and increase of salary which would have been earned had the officials concerned stayed at home. It is impossible, of course, in many cases to say what promotion, if any, would have been gained by these men. Nevertheless, if there is present the desire to do justice, we cannot help thinking that justice will be done.

Another difficult question will arise in connection with those officials who have had the misfortune to become wholly or partially incapacitated in consequence of naval or military service. In this connection the conference passed a resolution that suitable provision should be made by the municipal authorities in these cases, and that they should be empowered to pension or supplement the pensions allowed to officers who may suffer such total or partial disablement. The rest of the resolutions were of a more general character, and, so far as officials are concerned, will not, we are sure, form the subject of contention. They dealt with such subjects as the representation of officials in Parliament, security of tenure, and the necessity for supporting generally a representative association such as the National Association of Local Government Officers, which is continually alive to all proposed changes and able to take effective action.

* * *

Traction Engines and the Roads.

The Order which was recently issued by the Local Government Board withdrawing, for the duration of the war, the restrictions prohibiting the use of studs in the driving wheels of locomotives has caused something like consternation in the minds of those directly responsible for highway maintenance. The issue of this Order is only one more instance of the lack of appreciation by the authorities of the importance of maintaining in a state of the highest efficiency the public roads of the country at the present time. Up to the present highway engineers have been struggling against almost insuperable difficulties. Most of their labour has been taken away, and at the same time it has become exceedingly difficult to obtain material. This would not have mattered so much if there had been any corresponding decrease in the traffic. Unfortunately, however, the contrary is the case. Not only do the roads have to bear an enormous amount of military traffic, but also a largely increased volume of heavy commercial traffic, owing to circumstances directly or indirectly connected with the war. The result has already been a most serious depreciation in surfaces of many of the roads in the country. The avowed object of the Order under discussion is to assist farmers in the transport of cattle fodder and other materials. This, of course, is a matter of great importance, but there is another side to the question. For some years past large sums of money have been expended in rendering waterproof the surfaces of roads by the application of bituminous products. The result of allowing heavy traction engines, with studs fitted to their wheels, to pass over these roads will be the puncturing of the surfaces in innumerable places, thus rendering the penetration of water and the destruction of the surface of the roads a matter of certainty. As our correspondent, "A Scottish County Road Surveyor," says in another column, the outlay on road surfaces has to a large extent been met by Government grants derived from the taxation of motors, and undoubtedly this Order of the Local Government Board, if it remains in force, will be the means of undoing this excellent work. It is probably too late for effective action to be taken by any of the professional societies, but in our view they would be well advised at least to lodge some protest and to call the attention of the authorities to what must be the inevitable result of the working of the new Order.

* * *

Glasgow's Successful Tramways.

The congratulatory gathering held in Glasgow last week in connection with the municipal tramways undertaking was noteworthy in several respects. One was the handing by Bailie McNaughton, convener of the Tramways Sub-Committee on Finance, to Treasurer McMillan of a cheque for £2,328,889 for the purpose of wiping out the debt upon the undertaking, thus rendering it free of all liabilities, except that of administration. Even in these days of expansive finance, when money talks to some purpose, this particular cheque will have its own niche in the history of municipal undertakings throughout the world. Yet another regard in which the proceedings were notable was the explanation given of how such a vast sum came to be available for the enfranchisement of the system. How had such a balance been accumulated? The answer, in the matter-of-fact words of Councillor Montgomery, "was very simple." The Tramways Committee from the very beginning had had the ideal before them of giving the best and cheapest service to the community which it was possible to give, and in consequence of that the people of Glasgow had patronised the cars and given the tramways department an extraordinary revenue. The revenue in 1902, when the tramways were first electrified, was £600,000, a very substantial total, as will be allowed. To-day the income has quite doubled that figure, and will this year approach £1,250,000. These moneys were not invested in outside securities. They were sunk in the best of all securities—in the undertaking itself. It was not a rate-aiding enterprise, but one having for its aim the best and cheapest possible facilities of travel. This Glasgow record, unique in so far as results are concerned, will invite comparisons with undertakings in other large cities. It may also invite some criticism, for it is not to be forgotten that it has been erected upon a strictly monopolist system, without the intrusive competition that exists elsewhere. There is no gainsaying, however, that it forms a remarkable achievement as a municipal undertaking, and that, so far as appearances go, it commends itself to the citizens of Glasgow with the prideful feeling of conscious superiority.

* * *

Concrete Roads.

In the last engineering supplement of the *Times*, a letter of considerable interest on the subject of concrete roads appeared over the signature of Mr. W. Matthews Jones, the city surveyor of Chester. Mr. Jones has always been an enthusiast in regard to this matter, and, like everyone who advocates an innovation, he has found himself met with a considerable amount of unreasoning opposition. He now truly points out that, if engineers are afraid to make a beginning with something new, we shall remain without progress year after year. He maintains that, so far as roads are concerned, it is for the highway engineer to devise some method of overcoming the difficulties of the past. On the merits of the

proposal, he points out that one cause of want of success in concrete road construction has been that the engineer has failed to make himself thoroughly conversant with the traffic which uses, and is likely to use, the road when made. It is evident that unless this be done there is the double risk of failure or waste of material. If an engineer designs a bridge he has to take into consideration what the bridge is likely to carry, and he designs it accordingly. So it should be with a reinforced-concrete road. The question is one of great interest, and we are inclined to agree with Mr. Jones that engineers in this country should be afforded some opportunity of studying the matter on the spot, as in America, where this form of construction has been adopted in certain places on a considerable scale. If concrete construction can be made a success, there is no doubt that it is most economical, both as regards first cost and maintenance. If the matter were taken up by engineers, even in an experimental way to start with, it might well be the beginning of a radical reform in road construction methods, which would benefit not only the users of the roads, but also the pockets of the ratepayers.

* * *

National Service. In the last issue of our contemporary the *Referee*, the genial "Dagonet," writing under the heading "Breathings on the Glass," indulged in some reflections on the proposal that every man and woman between the ages of eighteen and sixty-one should perform national service in some form. In this connection he called attention to the fact that during the late snowfall the streets and pavements were in many places left unswept, and made the suggestion that among the occupations for which volunteers might be enrolled should be that of keeping the roads and streets clean. As is usual with "Dagonet," there is much sound sense in this suggestion. The outdoor staffs of most municipalities have been depleted to such an extent by men joining the Colours that it is literally impossible for them to perform their usual duties in an efficient manner. This can be seen not only in the matter of street cleaning, but also in that of refuse removal. In many places it has been found impossible to proceed with the usual periodical removal of house refuse, and in consequence the health of the community, especially in congested neighbourhoods, has been seriously threatened. We were glad to see in our contemporary such sound doctrine set forth as that the health, the comfort, and the safety of a great city are of vital importance even in war time. There can be no doubt that, if the public health services can be kept going in an efficient manner by volunteer workmen, the resulting benefit to the community at large will be very considerable. Probably many inhabitants would go as far as "Dagonet," who says that he is quite prepared to help in the emptying of his own dust-bin if volunteers can be found to remove the refuse in a cart.

* * *

Housing in Huddersfield. It appears from what passed at the last meeting of the Huddersfield Town Council that a serious situation has arisen in the town owing to the fact that various munition firms are pursuing a policy of buying dwelling-houses, giving notice to the tenants, and replacing them by imported munition workers. At the meeting in question a resolution was unanimously carried expressing the great concern with which the local authorities view this action. The situation is particularly serious owing to the fact that, although the Housing Committee are making every effort to meet the shortage of housing accommodation which exists in the town, they cannot get the consent of the authorities to build. It is plain that the action of the munition firms, as stated above, will seriously accentuate the existing shortage. A curious feature of the situation is that at the present time the munition firms who are turning people out of their houses in this way are the only people in the town who have power to build, inasmuch as the hands of the corporation are tied. The existing state of affairs certainly seems to call for some redress, and the strong resolution which was passed unanimously by the council will show that that body is alive to the situation, and it is to be hoped in the public interest that some arrangements may be found possible by which the munition firms in question will provide for housing their workers without disturbing existing tenants.

* * *

Steel in Reinforced Concrete. Since reinforced concrete was introduced into this country it has been customary to employ plain round mild-steel bars, but Mr. Arthur W. C. Shelf, the pioneer of physically developed steel bars for reinforced concrete in this country, in his paper on "High Tensile *versus* Mild Steel for Reinforced Concrete," to be read before the Society of Engineers at Burlington House, Piccadilly, W., on Monday next, will endeavour to prove "that plain mild-steel bars are not the best to employ for this purpose, but that greater efficiency and economy is obtained by physically developing mild-steel bars, for the purpose of taking out the first yield in the steel, which is useless and has a detrimental effect." Mr. Shelf contends that when this first yield or stretch is taken out, a higher yield point is obtained without any injury to the steel, so that it is then safer to employ a 20,000-lb. stress to the square inch (which results in a saving of 20 per cent in weight of steel required) than it is to employ a 16,000-lb. stress to the square inch before the steel is physically developed, and for this reason he considers that the existing regulation of the London County Council relating to the stress on steel should be altered, and thus avoid the cramping of industrial progress.

* * *

A Storm in a Teacup. If we had not by long experience ceased to be surprised at any action on the part of local authorities of a certain kind, we should hardly have believed it possible that such a storm could have been raised over so small a matter as that which took place at a recent meeting of the Newark Rural District Council on an account for £5 for taking a week's census of traffic on the Lincoln road. Owing to the difficulty or impossibility of securing men to do the work (which was undertaken at the request of the Road Board), the surveyor enlisted the services of a troop of Boy Scouts. The gist of the complaint in regard to his action seems to have been, not that the work was done inefficiently, nor, indeed, that the charge was in itself excessive, but that no authority had been obtained in advance for the expenditure. In view of the very small sum involved, the remarks of the chairman were surely a little extravagant. He spoke of the surveyor "running away with the council," and observed that the council could not pay for things unless they gave their sanction. To the outsider it all seems very petty in these days. The Scouts performed an emergency service, and apparently did it very well, and it is now "up to" the council to make a payment to the troop funds accordingly.

The Vesting of Streets in Urban Districts.—In our comments on this subject in our issue of last week, second column, line 20, for "the user of user" read "the area of user."

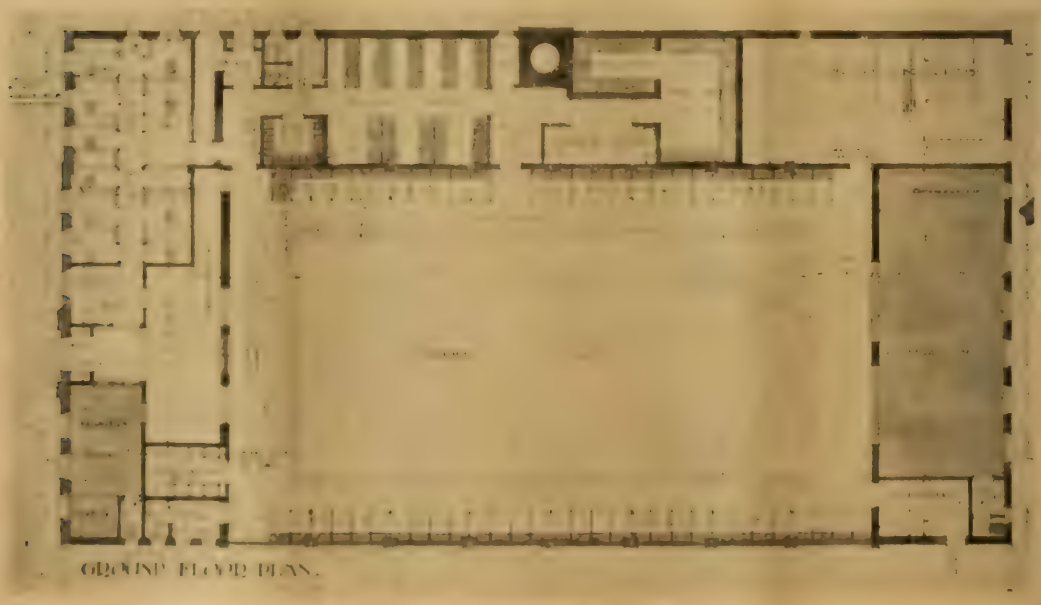
Ferro-Concrete in Swimming Bath Construction.

ITS APPLICATION AT MOTHERWELL.

The comparatively limited extent to which ferro-concrete has been used for swimming baths and ponds is the subject of comment in the February issue of the excellent Mouchel-Hennebique publication, *Ferro-Concrete*. As our contemporary observes, considering the obvious advantages of the material from the structural standpoint, are essentially similar.

A few swimming baths have been executed on the Mouchel-Hennebique system, and have given perfect satisfaction in every way. One of these, completed in 1908 at Northam for the Southampton Corporation,

New Public Baths, Motherwell, N.B.



Motherwell Public Baths—Plan.

for the construction of reservoirs and tanks of all descriptions, it is a little strange that it should not have been employed more widely on work which, was constructed under foundation conditions which rendered the adoption of ordinary concrete impracticable, but involved no difficulty in connection with

ferro-concrete work. There is also a fine ferro-concrete swimming bath at the Y.M.C.A. building in Tottenham Court-road, London.

In Scotland, a ferro-concrete swimming bath 76 ft. long by 36 ft. wide was constructed in the year 1909 for the Dundee Town Council from the designs of the city engineer, Mr. J. Thomson, M.Inst.C.E., and an open-air swimming pond in the same material was constructed at Pollokshaws in 1912 for the town council, the dimensions of this bath being 110 ft. long by 40 ft. wide. A third example has lately been completed at Motherwell, a large and flourishing town of some 50,000 inhabitants, about 12 miles south-east of Glasgow.

Motherwell Public Baths: Interior of Swimming Bath Hall.

Much damage has been caused to buildings in the town by settlements of the surface in consequence of mine workings, a fact which suggests the employment of ferro-concrete in place of ordinary construction. The alternative in question has been adopted with much advantage in Northwich and other places where instability of the soil renders ordinary buildings and other structures particularly liable to damage by subsidence. In view of the local conditions, it will be realised that the employment of Mouchel - Hennebique ferro-concrete was very wisely decided upon by the engineer, and the town council for the construction of the new swimming bath and other important parts of the building in which it was established.

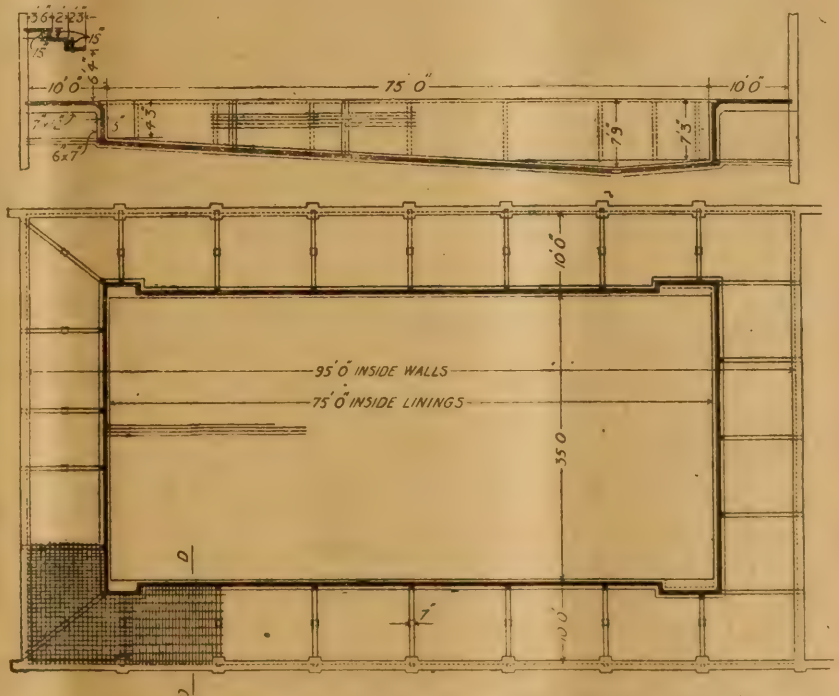
We reproduce a view of the baths from the High-road, the photograph showing the main face and one side of portion in which the swimming bath is accommodated. The scheme, executed under the auspices of the town council, was designed and carried through by Mr. A. Victor Wilson, B.Sc., Assoc.M.Inst.C.E., of Motherwell, at an estimated cost of £10,000, and comprises eleven slipper baths and waiting-rooms in connection, a Turkish bath, and foot baths and sprays for the use of bathers before entering the swimming bath, together with the usual office and lavatory accommodation.

The entrance hall is of commodious dimensions, and opens directly into the swimming bath hall, which is large and well lighted. The interior surfaces of the roofs are enamelled white, giving a particularly bright and inviting appearance to the hall.

The slipper baths are entered from a waiting-room at the left-hand side of the entrance hall, and beyond them is the Turkish bath.

The Turkish bath suite is very complete and self-contained. Close to the entrance are lavatories and boot stores. The two hot rooms and shampooing room are at the further end, the cooling-room and drying-hall being nearer the entrance, and a small Russian bath has been included.

The upper part of the boiler-house extends from the basement into the ground floor beyond the Turkish bath, the basement also containing a steam laundry equipped with modern machinery, store-rooms for coal and other requisites, and a complete range of subways around the lower portion of the swimming bath and beneath the slipper and spray bath departments. The subways around the swimming bath have ferro-concrete



Motherwell Public Baths: Plan and Longitudinal Section of Swimming Bath.

beams supporting the gangways in the same material on the floor above. All the water used in the establishment is filtered in the basement, and the plant is of capacity sufficient for dealing with the entire contents of the swimming bath in less than six hours.

In the large bath hall is the ferro-concrete swim-

ming pond, 75 ft. long by 35 ft. wide by 7 ft. 6 in. deep at one end and 4 ft. 6 in. deep at the other, the maximum depth being 8 ft. 6 in. about 12 ft. from the deep end. The depth of water is 6 ft. 4 in. at the deep end and 3 ft. 3 in. at the shallow end, the bath containing 90,000 gallons of water, maintained at a temperature of 75 deg. Fahr. Ample space has been provided around the bath for circulation and for two ranges of dressing-boxes. The auxiliary appliances

Motherwell Public Baths: View under Gallery.

include a diving-stage, spring board, travelling rings, and special apparatus for swimming instruction.

At the further end of the bath hall there is a gymnasium fitted with the usual appliances for physical exercise.

A special feature of the bath hall is the fine ferro-concrete gallery, so designed that from every part of it a full view of the swimming pond can be obtained.

Opening from the gallery is a club-room for the various clubs desiring to make use of the establishment, the remainder of the upper floor in the front portion of the building being occupied by the residence of the manager.

Ferro-Concrete Construction.

Having given a general description of the new baths, we turn next to details of the ferro-concrete construction, which were prepared from the engineer's drawings by Messrs. L. G. Mouchel & Partners, Limited, of Westminster.

As regards the swimming pond, while the bath itself is 75 ft. long by 35 ft. wide inside the lining, the entire monolithic construction is 95 ft. long by 55 ft. 3 in. wide, comprising the ferro-concrete cantilevers and flooring of the surrounding gangways as well as the bath. The bottom and sides of the bath are 5 in. thick throughout. The beams carrying the gangways are 7 in. wide by 12 in. deep, and are supported at one end by counterforts 7 in. square, projecting from the sides of the bath, the other end being embedded in the walls of the building. Therefore the gangways and one side of the subways around the bath are formed by the ferro-concrete work.

The columns are spaced 12 ft. apart, centre to centre, at a distance of 4 ft. 6 in. away from the main walls of the building, and offer no obstruction along the sides of the bath, as they are on the front line of the dressing-boxes. From each column a short transverse beam is carried back to a corresponding pier on the walls, these beams affording support for the topmost step of the gallery floor. The second step is carried partly by the columns and partly by the above-mentioned beams, and the third step projects in cantilever over the gangway below. This step has a kerb along the outer ledge, and upon it an iron railing is fixed.

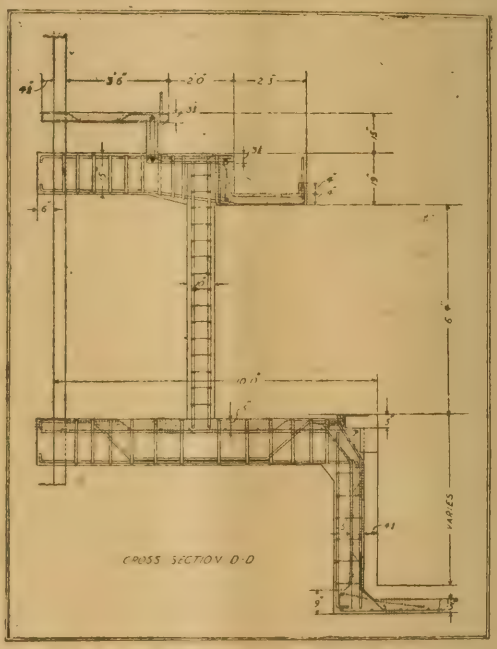
Under one corner of the gallery steps are provided for convenient access to the several tiers of seats. One of the accompanying photographic views shows in the foreground one of the columns, and in the background some of the dressing-boxes between other columns. The upper part represents the under side of the gallery, one of the short transverse beams being seen near the top at the left-hand side. The gallery is 7 ft. 9 in. wide, and designed to carry three tiers of seats for spectators.

In further explanation of the ferro-concrete construction we give a cross-section of the gallery, the drawing also showing part of the swimming-bath wall, one of the beams between the bath and the outer wall and the floor slab of the gangway around the bath.

The whole of the work is in monolithic connection, and reinforced in accordance with the well-known Mouchel-Hennebique standard practice, all the principal reinforcing bars of the various structural elements being securely embedded in the adjoining concrete, and where desirable the ends of the bars are hooked over other bars as an additional anchorage precaution.

The columns are 8 ft. high by 10 in. square, and are reinforced by four longitudinal rods with transverse links at frequent intervals apart. The short transverse beams supported by the columns are 5 in. wide by 15 in. deep for the greater part of their length and deepened down to 18 in. near the columns.

The bottom step of the gallery consists of a longitudinal beam 5 in. wide by 19 in. deep, extending from column to column, and a cantilever slab with an



Motherwell Public Baths: Section of Ferro-Concrete in Gallery.

effective width of 2 ft. The next step is 2 ft. 4 in. wide from front to back, this space being reduced to 2 ft. by the projection of the tier above. The top step is 3 ft. 6 in. wide, and has railings along the front, the space between these and the wall being 3 ft. 3 in., which is sufficient for the seats fixed against the latter.

The ferro-concrete construction was carried out by Mr. John Bertram, of Strathaven, and Messrs. L. G. Mouchel & Partners, Limited, were represented during the execution of the contract by Mr. T. O. Dixon, of Glasgow, their district engineer for Scotland.

Surveyors' Institution.—The next ordinary general meeting will be held in the lecture hall of the institution on Monday, the 12th inst., when the discussion on the paper on the "Defence of the Realm (Acquisition of Land) Act, 1916," read by Mr. Edwin Savill on February 12th, will be resumed. The chair will be taken at 5 o'clock.

Comparative Reports of General Practice.—(LXXXV.).

MOTOR TRACTION FOR MUNICIPAL PURPOSES.

The subjoined return, prepared by the Surveyor, Mr. F. S. R. Carter, was recently presented to the Beddington and Wallington, Surrey, Urban District Council.

Highways and Byways.*--(2.)

By LAWRENCE W. CHUBB, Secretary to the Commons and Footpaths Preservation Society.

The friction caused by the erection of turnpikes and the imposition of tolls led to much disorder, and culminated in the notorious Rebecca Riots in South Wales. In the meantime, general Acts were passed authorising the punishment by whipping, and, in 1734, even by death of offenders who destroyed gates or toll-houses; but the state of friction continued until Parliament adopted a recommendation of a Select Committee of the House of Commons made in 1864, and finally declined to renew Turnpike Continuance Bills. The Highways and Locomotives Act, 1878, provided that such roads should become main roads, the expense of repair being jointly defrayed by quarter sessions and by grants from the Consolidated Funds. These roads are now under the care of the county councils.

It is greatly to be regretted that, by an obvious oversight, Parliament, when abolishing turnpike trusts, did not take steps to ensure that their records should be handed over to Quarter Sessions. It was enacted that the special powers of the trusts to abate encroachments should be continued; but the plans and records of the trusts which were essential to prove the existence of such encroachments remained with private individuals, to whom they were useless. Such records have a definite historic value, and should be in the keeping of the county authorities. They throw much light upon economic problems of the eighteenth and nineteenth centuries, and are of considerable public interest and utility. County councils should therefore be empowered to acquire these records, on the ground that they concern all the main highways in the country, many of which have been public roads since their construction by the Romans.

CONSOLIDATION OF HIGHWAY ACTS.

Time does not permit me to describe the gradual development of the civic responsibility for the maintenance and preservation of secondary and other highways. On this subject many Acts of Parliament have been passed; indeed, so numerous have these become that authoritative works of reference upon highway laws give extracts from over fifty. A great public service would be rendered if these Acts could be consolidated into one comprehensive Statute.

It may be permissible to express the hope that a group of the barristers who doubtless have recently volunteered for some form of National Service may be deputed to perform this practical and useful task.

ROAD EXPENDITURE.

Few of us perhaps realise the vast expenditure entailed in the upkeep of public roads in England and Wales. For the last normal year before the war it amounted to over £10,500,000—a sum which considerably exceeds the total revenue of Denmark. The burden of repair is increasing rapidly. Since 1907 it has grown by 11½ per cent. The total length of roads repaired by local authorities already amounts to not less than 151,112 miles, and if, and when, the recently proposed schemes of arterial road construction materialise, to meet the growing needs of speedy motor traffic, it is clear that the State will have to bear a considerable share of the financial burden.

PUBLIC RIGHTS.

It is now necessary to invite you to consider what is perhaps the most important and interesting aspect of the subject—the protection of public rights of way from obstruction. We have seen that once a highway has been dedicated to the public it can only be lawfully closed by Act of Parliament or Justices' Order. To obstruct it by any other means is unlawful, for the obstruction of a public way is a nuisance. We are all familiar with the maxim, "Once a highway always a highway," which is based on a decision that no length of time can legalise a public nuisance (*Rex v. Close*, 3 Camp., 227).

Theoretically, therefore, a highway of any kind once created can never be lawfully closed by the irregular action of any individual. This principle has been good in all directions, but prior to the reform of local government effected by the Local Government Acts, 1888 and 1894, the burden of protecting rights of way was not obligatory upon a local authority, but mainly depended upon the voluntary efforts of the village Hampden. The power of the cumulative vote enabled one or two owners to disregard the needs and wishes of the inhabitants of an entire parish in vestry assembled.

For many years the Commons and Footpaths Preservation Society had found it necessary to include in its programme the work of preserving public rights of way, and the National Footpath Preservation Society was formed in 1884 by the late Mr. Henry Allnutt, and did much useful work.

In 1899 the National Footpaths Preservation Society was amalgamated with the Commons Preservation Society, and the work has so grown that, during the last twenty years, nearly 10,000 cases of obstruction of public roads, bridle-ways, and footpaths have been dealt with by the society. Relatively few of these cases have concerned public carriage roads. Those highways are generally repaired at the public expense, and, when that has happened, no question can arise as to the existence of a right of way. Only a small minority of footpaths, however, are repaired by the public, and disputes with regard to them are of frequent occurrence.

It is therefore fortunate that local authorities have far-reaching powers, which, if wisely and fearlessly exercised, render difficult, if not impossible, unlawful attempts to obstruct rights of way. Lord Eversley, the veteran president of the society—the monument of whose fifty-one years of devoted and successful service in fighting the people's battles may be seen in the tens of thousands of acres of common land over which all may wander at will—succeeded in securing the insertion in the Local Government Act, 1894, of a drastic clause with regard to rights of way. This clause (26) declares it to be the duty of district and town councils, as highway authorities, to maintain all public rights of way within their area or in an adjoining district. They were directed to take any steps necessary to that end, including legal proceedings. In rural districts the Act authorised the parish council or parish meeting to put the highway authority in motion, and if it evaded its obligatory duty a power of appeal from the parish to the county council was given. Local councils have therefore ample facilities for vindicating public rights, but in practice it has frequently happened that they have failed to act. The reasons for their inactivity are manifold. Sometimes they fear a lawsuit with its attendant expense, trouble, and uncertainty; or they may be composed of persons who have no sympathy with the public point of view. Again, in an even greater number of cases, they may be influenced by the fact that many of their members work for, or are tenants of, the landowner who is endeavouring to shut up a public path. The power of territorial influence in a country parish is very real. In one typical case in which the Commons and Footpaths Society succeeded in securing and reopening of a public path, the aggressor was not only a magistrate, the patron of the church living, and the lord of the manor, but the chairman of the district and parish councils, and a county councillor as well. Naturally none of those bodies would enforce the law against him; and in this, and in thousands of cases of a similar kind, it has only been the force of popular opinion created, organised, and crystallised into action by the Commons and Footpaths Preservation Society that has led to the vindication of public rights.

RIGHTS OF WAY.

A footpath has many enemies, and it is fortunate that it is a stubborn thing. Its origin may be lost even to tradition, but the path pursues its way with odd twists and turns which now appear meaningless, but which in former days were probably necessary to enable the wayfarer to avoid morasses, ponds, trees, or other natural obstructions which have long since disappeared. The path at one time probably led to a now-forgotten shrine, or chapel, or well, and it certainly came into use to meet a local need. At the moment it may be valued only by ramblers and Nature study enthusiasts, but that affords no reason why it should be arbitrarily closed. The ebb is followed by the flow, and paths which to-day may be

* Paper read before the Royal Society of Arts on the 14th ult.

of little value in the utilitarian sense may to-morrow become of much importance, especially now that the motor car absorbs the country lane as well as the great main roads

When a right of passage over a path which has hitherto been open is challenged, the first step which must be taken is to ascertain and marshal the facts both for and against the popular claim. A public path has certain definite characteristics. As a rule, it is provided with stiles, wicket, or other gates and footbridges; it is often a short cut, and it must be a thoroughfare leading from and to a place where the public have a right to be. Above all, it is desirable to be able to prove that the path has, in fact, been used for a long time as a public way by all who have desired to traverse it. Records, such as tithe or inclosure awards, sale plans, or ancient maps may be available to prove the antiquity of the way, although in view of recent decisions many maps are not admissible as evidence unless the surveyor by whom they were made can be produced to prove them.

PERIOD OF USER.

Unfortunately, up to the present, Parliament has prescribed no fixed period of years of user for establishing a public, as distinguished from a private, right of way. The period varies in accordance with the views of particular judges, and with all the circumstances in connection with the formation, location, and history of the path. In one Metropolitan case (*North London Railway Company* v. *Islington Vestry* (1872), Q.B. 37, J.P. 341), the brief period of eighteen months' user was deemed to be sufficient to support the presumption of dedication. In others, as we shall see, evidence stretching back as far as the oldest men can recollect has been held to be inadequate. It is therefore desirable to aim at securing evidence of forty, or, if possible, of sixty years' duration.

Assuming that inquiry has proved satisfactory upon these points, and that no adverse evidence has come to light, it is fairly safe to conclude that the path in question is, *primâ facie*, a public right of way. But it must not be forgotten that, in the case of most ways which have been challenged, evidence of some sort is also available on the owner's side, and it is of extreme importance that this also should be ascertained. As we have seen, public paths were not created by user. They originated in dedication, and, save in the rare cases where "express" dedication is capable of proof, it is necessary to establish a chain of facts so strongly in favour of the public contention that a judge will hold that the only fair inference or presumption to draw from those facts is that some owner, at some time or another, intended to dedicate a right of way. Such an inference may manifestly be rebutted if the owner can produce evidence of steps taken to protect himself from the presumption of dedication. Sometimes he has erected and maintained notices clearly indicating that persons using the path have done so with his permission; at other times he has closed the path once a year; or again, he may have issued permits for the use of the path. The owner may easily and fully protect himself by steps of this nature from the risk of having a revocable licence transformed into a right against himself.

METHODS OF OBSTRUCTION.

But, as a rule, obstruction, like dedication, is a gradual process, and the form of obstruction most to be feared is of a surreptitious nature which affords an unscrupulous landowner many opportunities for building up a case against the public. His first step will probably be to discourage the use by his own tenants and employees of a path he desires to close. A frequent excuse is that he wishes to establish game preserves and desires privacy. In a country village where the cottages all belong to one owner it is almost impossible for the tenant to ignore the wishes of his landlord. I have known instances in which a man has been summarily ejected from the home of his fathers because his conscience would not permit him to acquiesce in the unjustifiable and unlawful obstruction of a public path. Such landlords are, fortunately, few in number.

Another favourite device is to erect notice-boards warning trespassers or boldly denying the right of way. Sometimes notices are of a more intimidating nature. "Beware of the bull" is often met with, while near Uxbridge a fearsome notice warning pedestrians to "Beware of the Red Bloodhound" may be seen. Close to Croydon, too, there is a wood, happily crossed by several beautiful public paths, where notices warning pedestrians against mantraps and spring guns are still displayed, although the use of such barbarous engines has long been illegal.

ADVICE TO LOCAL AUTHORITIES.

These wooden falsehoods, as they have been aptly described, are difficult to overcome, for, as an eminent judge once said, "A man is entitled to erect on his own land as many lies as he likes, provided they are not libels." The best remedy for this form of attack is to urge the district council to erect finger-posts under the powers conferred upon them by the Highways Act, 1835.

Sometimes, too, the path is obliterated and rendered inconvenient by ploughing. The rule is that a path cannot be lawfully ploughed unless it was originally dedicated subject to the reservation by the owner of the right to plough. Proof of that reservation exists when the path has been regularly ploughed up in the ordinary course of husbandry in the past. (*Harrison* v. *Danby*, 34, J.P. 759.)

Another favourite device is to place barbed wire at the sides of a path in such a manner that pedestrians using the way run the risk of injuring their persons or clothing. If the wire is, in fact, a danger it should be removed as a nuisance at the instance of the highway authority under the Barbed Wire Act, 1893, and damages for injury may be obtained (*Stewart* v. *Wright*, 9 Times L.R. 480.)

Some persons do not hesitate to put bulls or other savage animals in a field through which a public path passes. They have no legal justification for action of this kind, and in one case (*Lowery* v. *Walker*, L.R. 1911, A.C. 10) the House of Lords decided that a man was entitled to damages for injuries inflicted by a horse while he was following a footpath not dedicated as a public right of way, but which was habitually used by the public to the knowledge of the owner as a short cut to the railway station.

Many a path, too, has been gradually lost because the stiles and gates have been allowed to become defective; because footbridges or stepping-stones have disappeared, or because, for lack of a little attention, the tracks have become water-logged or overgrown.

It cannot be denied that a stile perched on the top of a bank may become a serious obstruction when footboards are removed, or when the whole structure decays.

It is, *primâ facie*, the duty of district councils to repair all public highways (including footpaths, but not main roads) known to have been in existence before the Highway Act, 1835, became operative, unless the burden of repair, *ratione tenuræ* or *ratione clausuræ* falls upon the occupier of the land through which such ways pass. The councils can, and should, keep public paths in a reasonable state of repair, and if stiles are allowed to degenerate into such a condition that they are a hindrance to passage they should be dealt with as obstructions. Parish councils, too, are entitled to repair footpaths which are not situate at the sides of public carriage roads, and the Local Government Board have decided that they may also repair stiles and gates, although, in a technical sense, such erections are part of a fence and not of the highway. As to the nature of the repairs the law holds an even balance. The council must not decrease the height of a stile or put a wicket gate in its place if the owner raises objection, because by so doing it would be encouraging a greater number of persons to use the way. On the other hand, the owner must not make a stile less convenient, nor erect one where none previously existed, because if he did so he would be diminishing the public right. In the latter event, too, he might interfere with perambulators, for it has been laid down that the homely perambulator may be wheeled over a footpath, provided it is not of such size and weight as to injure the soil or inconvenience pedestrians, the justification being that a perambulator is a usual accompaniment of a large class of foot-passengers. (*R.* v. *Mathias* (1861), 2 F. and F., 570.)

Field-paths are of so much advantage to the community that it should be the aim of every council to maintain those within their area in a reasonable condition. They must not, without consent, metal a path which has not previously been repaired, or they may find themselves in the unenviable predicament recently experienced by a Berkshire parish council, which was served with a writ by an irate owner because it had innocently ventured to put down a

little stone in holes in a meadow-path, in order to enable the village children to reach their school dry-shod. But they can, in practice, do all that is required to prevent a path from vanishing through disuse.

(To be concluded.)

SPECIFICATIONS FOR CONCRETE ROADS.*

By H Eltinge Breed.

First Deputy Commissioner, New York Commission of Highways.

Cracking of a concrete pavement is due generally to the unequal settlement of a poor subgrade. If the road is to be satisfactory it is of first importance that a good subgrade be secured. These we consider the essentials of a good subgrade:—

(1) It must have uniform bearing power.

If an old road-bed is to be used it must be scarified, re-shaped and re-rolled for the entire width of the pavement, removing all large stone to a depth of 6 in.

(2) It must be dry.

Ditches should be low enough to take away the water from under the pavement. With unstable soil good results can be secured by providing sub-drains and spreading a layer of gravel—preferably run-of-bank gravel—over the subgrade to increase its stability. Material used for this purpose must be impervious; if it is porous it will act during wet periods as a reservoir, which, under conditions of frost, will break the pavement proper.

(3) It should have metal reinforcement (*a*) under very bad—*i.e.*, unequal soil conditions; (*b*) whenever the supporting power of the subgrade changes, as from rock to earth, or passing over a trench.

Our experience indicates that the expense of reinforcement is not justified in gravelly or sandy soils where good natural drainage prevails.

THE MIX.

The mix should be proportioned in such a manner as to give the greatest density. With our requirements for materials we have found that the proportions of 1:1½:3 most nearly do this. Our specifications provide that the concrete shall be mixed in the proportions of 1 volume of cement to 4½ volumes of sand and broken stone or gravel, and the proportions of fine and coarse aggregate are varied slightly as a result of field void tests so that the greatest density is obtained. Should the size or character of the materials change there would be a corresponding change in the proportioning of the mixture.

The coarse aggregate should consist of a well-mixed product of clean No. 1, No. 2 and No. 3 stone or gravel.

No. 1 size is that retained on a ¾-in. circular screen and passing a ¼-in. circular screen.

No. 2 size is that retained on a ¾-in. circular screen and passing a 1½-in. circular screen.

No. 3 size is that retained on a 1½-in. circular screen and passing a 2½-in. circular screen.

It is provided, however, that not more than 25 per cent of the total shall be No. 1 size, the proportions being so graded as to give a minimum of voids.

Aggregates should never be used unless they comply with the tests prescribed.

You may note that we allow, as our maximum size, stone that will pass a 2½-in. ring, whereas most specifications permit only 1½-in. stone as a maximum. This may seem radical, but our reason for the increase in size is that we get equally as good, if not better, results from the larger stone, and at a cost decidedly lessened by our using more nearly the product of the crusher. Especially is the price to be considered on contracts where the local supply is crushed on the ground, as is the case in most of our work. If you have economy, this change is worthy of your consideration. We save 15 per cent in crushing costs by the use of stone larger than the previously accepted standards.

From a practical standpoint, a pile of stone graded from ¾ in. to 2½ in. has more stability when properly mixed than stone graded from ¾ in. to 1½ in. In our tests, and we have used stone up to 2½ in. in size. As an evidence of the comparative strength per square inch of such mixes, tested at an age of twenty-eight days, we have a grand average of 3,370 lb. per square inch for 264 cubes of stone and gravel, of which only 13¾ per cent were under 3,000 lb. Greater density can be obtained by using stone up to 2½ in. in size, and with the larger size stone there is less probability of spalling at joints and along edges.

SAND.

Concrete pavement sand should be such that 100 per cent should pass the ¼-in. screen; not more than 20 per cent should pass a No. 50 sieve, and not more than 6 per cent should pass a No. 100 sieve. However, where more than 20 per cent of the sand passes a No. 50 sieve, where it is well-graded to give a low percentage of voids, and where it conforms to all other requisites, special permission for its use may be given by the chief engineer. Sand may be rejected if it contain more than 5 per cent of loam or silt.

METHOD OF MIXING.

The concrete should be mixed in approved mechanical batch mixers. Mixing should be continued at a speed of not less than 10 revolutions nor more than 16 revolutions per minute, for at least one minute after all materials are in the drum and before any discharge is made.

If at any time during the progress of the work the temperature is so low that in the opinion of the engineer in charge of the work it will within 24 hours drop to 35 deg. Fahr., the water and aggregates should be heated and precautions taken to protect the work from freezing for at least ten days. Should these temperature conditions persist for two consecutive days, permission should be obtained from the chief engineer before proceeding. He will lay down such requirements of procedure as may be permitted. Such procedure should be only for emergency work. In no case should concrete be deposited on a frozen subgrade.

* From a paper read at the annual convention of the American Road Builders' Association.

STREET LIGHTING IN THE METROPOLIS.

NEW METHODS OF OBSCURING.

In the House of Commons on Monday the Home Secretary was asked to explain why the lighting of London had not yet been made uniform in accordance with the orders of the military authorities; whether he was aware that in some boroughs burners were in use consuming 3½ cub. ft. of gas per hour in lamps which were almost completely opaque; and whether he would consider, in order to give a reasonable light and at the same time save gas, if it would be more advantageous for the lower part of the lamp to be clear, but a smaller burner used.

Sir George Cave, in reply, said the alterations in the method of obscuring street lamps were being carried out by the lighting authorities as rapidly as the exigencies of labour would permit, but he was aware that there were some lamps which still remained to be dealt with. A considerable reduction in the consumption of gas had been effected by the use of single burners in multiple-burner lamps and by substituting lower-power burners for those normally used. If the lower part of a lamp were left clear, the result was to throw a disc of light upon the pavement which was visible from above; and he was advised that, taking all things into consideration, the method of obscuring which had been approved was the most satisfactory.

Gas in Sewers.—Following upon a fatal case of asphyxiation by sewer gas, the Main Drainage Committee of the London County Council have authorised measures to be taken when there is reason to suspect the condition of the atmosphere in sewers, and have sanctioned an expenditure of £50 on the purchase of smoke helmets, a hand ventilating fan, and other necessary articles.

Underground Gasholders.—In the course of the last meeting of the Deptford Borough Council a member proposed, "in the interests of health and public safety," that that body should pass a resolution expressing the opinion that all gasometers within one mile of any human habitation should be placed underground, and that the Government should take action to effect the change at an early date. After it had been pointed out to the worthy councillor that in order to put a gasholder underground it might be necessary first to excavate as much as twenty million cubic feet of earth, and the mayor had suggested that the Government should request gas companies to plant poplars round the gasholders and grow climbing roses, the motion was rejected.

Institution of Municipal and County Engineers.

SOUTH WALES DISTRICT MEETING AT NEATH.

A meeting of the South Wales District of the Institution of Municipal and County Engineers was held at Neath on Saturday last, the following being present:—Messrs. J. Richard Heath (Swansea), G. A. Phillips (Glamorgan County), D. M. Jenkins (Neath), D. M. Davies (Neath), A. S. V. Taylor (Bedwas), E. C. Pole (Cardiff), John Morgan (Pontardawe), J. H. Montgomery (Llanelly), F. Hatcher (Porthcawl), and H. Alex. Clarke (Briton Ferry), hon. district secretary.

DISTRICT CHAIRMAN'S ILLNESS.

At the outset of the proceedings the hon. district secretary announced with regret that their esteemed chairman (Mr. W. Harpur, Cardiff) was unable to be present owing to continued ill-health, in consequence of which he asked the meeting not to consider him for re-election to the office of chairman, which he was bound to relinquish.

Mr. D. M. Jenkins was elected chairman *pro tem.*, and proposed a vote of sympathy with Mr. Harpur in his illness, with an expression of hope for a speedy recovery. Mr. Harpur, he said, was one of the most distinguished members of the institution, and the district was honoured to have such a gentleman to preside over its meetings.

Mr. G. A. Phillips seconded the resolution, and Mr. J. R. Heath, in support, remarked that Mr. Harpur's reputation in the Midlands as an engineer was one to be proud of.

Mr. H. Alex. Clarke added that Mr. Harpur had been a friend to him, and he felt his resignation deeply. He proposed that the meeting nominate Mr. D. M. Jenkins borough engineer, Neath, as district chairman.

Mr. G. A. Phillips seconded, and it was unanimously agreed to.

Mr. Jenkins thanked the meeting, and accepted the office on the condition that when Mr. Harpur was restored to health and returned to duties, he (Mr. Jenkins) would immediately vacate the chair for him. Mr. Harpur had set such a high example that it was difficult to follow him. However, he would do his best, and he hoped the year's work would be interesting and productive. Personally, he was a great believer in the educational value of discussions, and he hoped that their meetings in the future would include at least one paper on a topic that was appropriate.

RE-ELECTION OF HON. DISTRICT SECRETARY AND DISTRICT REPRESENTATIVE.

Mr. D. M. Davies proposed the re-election of Mr. H. Alex. Clarke as hon. district secretary.

Mr. John Morgan seconded, and it was unanimously agreed to.

Mr. G. A. Phillips was also re-appointed district representative, on the proposition of the Chairman, seconded by Mr. J. R. Heath.

FUTURE MEETINGS.

The Hon. District Secretary said he had interested himself in the matter of spring and summer meetings, and although the South Wales district was difficult to organise owing chiefly to the isolation of its members, he hoped a special effort would be made to attend the future meetings. He read a letter from Mr. Morley, Tenby, stating that it was his intention of inviting the members to visit his district when the new sewerage scheme was completed, and it was hoped to be able to arrange a meeting in the early summer.

Mr. D. M. Davies invited the members to inspect the Ystradfelte Waterworks in June, and Mr. Fred Hatcher extended a hearty welcome to Porthcawl in July.

Both offers were accepted with thanks.

THE ORPHAN FUND.

The recent proposals of Mr. O. Claude Robson for assisting the Orphan Fund were considered, and the chairman's promise to act as collector for the district was confirmed.

TOWN PLANNING.

In the course of an instructive address on "Town Planning" the Chairman remarked that very few subjects had been so much discussed in recent years, and on the principles involved very little remained to be said. However, a concrete example of the actual steps taken in the initial stage of a scheme might be of service. Neath being one of only four towns in South Wales that had embarked upon town-planning schemes, a statement of the procedure followed, and the experience gained should be of interest and value at a meeting of South Wales municipal engineers.

Sanction had been granted the Neath Corporation by the Local Government Board for the preparation of two schemes. The first dealt with lands within the borough, having a total area of 270 acres. Application was made to the Local Government Board on August 6, 1914, and sanction was given on March 3, 1915. In this scheme no part of the adjoining district of the Neath rural district was included, for the reason that the rural council had determined to prepare a scheme of their own. Owing to pressure of other work, however, the council had not been able to proceed with the work, but a start would be made as soon as circumstances permitted. In regard to the second scheme, for the purpose of developing part of the land within the borough intended to be town-planned, a new road was provisionally laid out, passing through a part of the rural district, wedged in between adjoining parts of the borough. In the circumstances, and in order to save time, it became desirable to take compulsory powers for acquiring the necessary land, and with the approval of the rural council the corporation applied for, and obtained, sanction to prepare a scheme for a small portion of the rural district—an area of 23 acres.

Mr. Jenkins then gave an interesting account of the detailed work done, following seriatim the Amended Procedure Regulations of the Local Government Board issued in February, 1914. These, he said, considerably simplified the procedure laid down in the original regulations, and to a great extent removed the objection urged against them. As a first step, it was obviously necessary that a town-planning committee should be appointed to consider carefully the lands to be comprised in the scheme, and with authority to initiate all preliminary steps. It was decided to include all lands likely to be required for building, open spaces, &c., for a reasonable period in advance. The ordnance survey of the whole borough was brought up to date, and in order to reduce labour, and to provide for other schemes in hand, photo copies were prepared, with the sanction of the Ordnance Survey Department.

Incidentally, he remarked that some objection was raised to the map not consisting of actual ordnance sheets (as provided in the regulations), but the copies were, notwithstanding the objection, accepted. He explained that the map was cut into sections, and mounted on linen in folding form, and encased in a leather thumb case. Extracts were given from the statements and particulars furnished to the Local Government Board, under Article V., and the procedure at the Local Government Board inquiries was detailed. The resolutions adopted were generally in the form of Mr. Aldridge's "Case for Town Planning," which would be found most useful and suggestive. Reference was made to the new municipal housing policy, which included the granting to local authorities of power to purchase land and lease it, under proper safeguards, for building by public utility societies, private builders, &c.

Mr. Jenkins pointed out that there were two principal methods of preparing a town-planning scheme—the one in which all developments were worked out in great detail, with small discretionary powers and little scope for variation subsequently; and the other, in which broad general principles were laid down, with wide discretionary powers. The latter method was generally preferable, but there was no practical difficulty—and in some cases an advantage—to combine both methods in the same scheme. In conclusion, he spoke of the necessity of broadening the scope of town-planning schemes, and the need

of co-ordination in the laying out of new arterial roads through adjoining districts and counties.

Eulogistic references were made to the chairman's instructive, lucid, and entertaining address, and a vote of thanks was accorded him on the proposition of Mr. Heaton seconded by Mr. D. M. Davies.

COUNCIL MEETING.

At the last meeting of the Council of the Institution of Municipal and County Engineers, it was resolved, on the recommendation of the Roads and Tramways Committee, that the secretary be instructed to inform the Local Government Board, in reply to their letter of December 1st, that in the opinion of the council it was very desirable in the public interest that the Local Government Board Emergency Provisions Act should be amended, so as to render costly litigation unnecessary in connection with the matter of routes used for occasional Sunday omnibuses.

NOMINATION OF ORDINARY MEMBERS OF COUNCIL.

It was resolved to nominate the following for election, as ordinary members of council:—Messrs. E. E. W. Butt, G. F. Carter, P. Dodd, E. J. Elford, H. P. Foster, G. Green, W. T. Lancashire, E. B. Martin, F. Massie, T. Moulding, W. H. Prescott, N. Scorgie, C. F. Wike, E. Willis, and E. Worrall.

The secretary reported that the following nominations had been received from members:—Messrs. O. A. Bridges, H. T. Chapman, P. Dodd, G. Green, J. R. Mead, T. Moulding, E. Willis, E. Worrall, of which Messrs. P. Dodd, G. Green, T. Moulding, E. Willis, E. Worrall had already been nominated by the council. To the remaining three names it was resolved to add those of Messrs. A. Gladwell (Eton Rural District Council) and W. R. Hicks (Ealing).

THE ORPHAN FUND.

It was resolved to inform Mr. D. Edwards that a proposition which he had made that contributions should be made to the Orphan Fund from the funds of the institution could not be carried out, as the council had been informed that it would be illegal.

SANITARY SERVICE WORKMEN.

A letter from Mr. J. A. Priestley, with regard to military service and work of cleansing departments and bad time-keeping, was considered, and it was resolved that the council support any action that may result in public sanitary service being placed on the same footing as waterworks, &c.

STREET LIGHTING SPECIFICATION.

Mr. E. J. Elford reported that the delegates appointed to deal with this matter recommend that the council should support the Institution of Electrical Engineers in their proposal to publish a majority report, but that it should be deferred until after the war.

The report was approved and adopted.

Cheap Gas for Heating and Cooking.—The Halifax Corporation Gas Committee are introducing a scheme under which gas consumers in the borough can obtain gas at a cheaper rate for heating and cooking than for lighting purposes.

Waterproof Vaults.—The architect to the Great Northern Railway of Scotland in building the Palace Hotel, Aberdeen, took the precaution of lining the roof of the vaults under the pavement with Pudloed cement, and the result is stated to be most satisfactory. This is worthy of note, as percolation of water in vaults of this description is a difficulty often encountered and one which is liable to cause much expense in repairing.

Profitable Refuse at Birmingham.—The Birmingham city refuse disposal department have been able to make considerable gains by dealing with waste paper and rags which before the war were simply put through the destructor. It now appears that Mr. J. Jackson, the superintendent, has on hand a project, the object of which is to produce from the refuse of local slaughter-houses a food suitable for use in piggeries. Hitherto the refuse consisting of offal, known in the trade as "third, second and third stomachs" has been burned. Another scheme for the collection of food refuse is also engaging attention. It is apparent that large quantities of waste food from the munition canteens and canteen workers' dining-halls might be collected for the feeding of pigs and a plan is under consideration for the collection of this food.

NOTES FROM IRELAND.

Specially Contributed by an Irish Correspondent.

[In the hope of making these notes as practically useful as possible the writer invites readers to favour him with communications thereon from time to time. They might be constructively critical, or helpfully supplementary, might indicate new points upon which information is desired, or might merely convey information. Communications will reach the writer if addressed "Irish Notes," 24 Bride-lane, Fleet-street, E.C.]

Opportunities for Improvement in Dublin.

The destruction of a large number of the buildings in Sackville-street, Dublin, during the rebellion last year has given the corporation and the owners of property a unique opportunity of widening and improving some of the main thoroughfares leading off it. The most important of these thoroughfares, or, at any rate, the street the widening of which would benefit the general public most largely, is Earl-street. This street runs from Nelson's pillar to Amiens-street Station, the terminus of the Great Northern Railway, and it is also the outlet to Clontarf and a large suburban area on the north-eastern side of Dublin. At present the street is so narrow that there is only room for a single line of tramway down it, but in order to facilitate this traffic there are two or three passing places for cars in the street. When the cars are passing each other at these loops, however, the street is practically blocked to other traffic at these points, and so constant delays are occurring, causing great inconvenience to travellers.

* * * *

During the rebellion a portion of the buildings in the street was demolished, as well as a great part of Sackville-street, and the opportunity now offers of widening the street without much difficulty by 14 ft. at the Sackville-street end. One would suppose that the opportunity of widening would have been eagerly grasped by the corporation and welcomed by the residents of the street. But no; the corporation are divided on the matter, while many of the residents of the street seem opposed to it on the ground that business is better in narrow and congested streets than in wide thoroughfares. Whether the contention is true or not, it seems a very selfish policy to oppose the widening of a leading outlet from the city, particularly when the proposed widening would not be more than sufficient to enable traffic to move freely. If new houses are now built up to the old line of frontage, or nearly up to the line, it will no doubt be generations before the opportunity will occur again of widening the street. In the meantime much of the traffic will probably be diverted to other routes, and the traders in the street will find they have overreached themselves, and that they are losing their trade instead of improving it.

* * * *

Testing Facilities in Ireland.

The writer regrets that he is unable to agree with Messrs. Faija and Co. in their recent letter that samples of materials from Ireland can be tested with equal facility and convenience at their testing house at Westminster as at a testing house situated in a central situation in Ireland. The samples could no doubt be generally forwarded without difficulty, but many engineers like to see their test-pieces, or samples, dealt with personally; the expense entailed in travelling and the time occupied, however, usually prevents a man going to London for the special purpose of seeing a few tests made. Some time ago the writer spent something like £200 in the course of a few years in payment to inspectors and in travelling to England to inspect and to test material. A good deal of this expense might have been saved if there had been a testing-house in Dublin, as his inspectors could then have sent him over test-pieces for testing at home.

* * * *

With regard to Messrs. Faija and Co.'s protest against the establishment of a public testing-house in connection with one of the universities, the writer quite recognises the strong arguments against such a course, but in a country where there is little or no probability of a private firm taking up the testing of materials, there is an excuse for the writer's suggestion, and he does not quite see why the Agri-

* * * *

Cork University College Laboratories.

When the writer referred in his notes of December 29th to the want of a testing house in Ireland, he was not aware that a considerable amount of testing was carried out every year in the laboratories attached to the Engineering School of the University College, Cork. These laboratories appear to be now fully equipped, the testing-house, in particular, being fitted out with some of the most modern machines and tools necessary for testing purposes. In addition it is under the personal direction of Mr. C. W. Alexander, the well-known Professor of Engineering, and it may therefore be assumed that any tests made of materials at the university will be strictly accurate, and may be relied on. These laboratories, besides being most useful and valuable in the training of the university students and for the testing of material for public bodies, afford also opportunities for carrying on special research work by the professors and advanced students at the college.

* * * *

Reinforced Concrete Investigations.

At present Professor Alexander is engaged in investigating the strength of concrete and reinforced concrete under adverse conditions. A study of the behaviour of concrete under different forms of reinforcement, and subject to various stresses, is a branch of engineering which can no doubt be best investigated by a man who can determine rapidly and with accuracy the stresses which theory shows should exist in any combination of reinforced material, and who can then in a well-equipped workshop compare the results obtained theoretically with those obtained when the reinforced material is actually tested under various loads. It is to be hoped that Professor Alexander will shortly publish particulars of his investigations in connection with reinforced concrete, so that engineers may be able to study the results obtained by him in connection with a subject which presents so many complex and varying conditions, and for which formulæ are useless unless checked by careful experiments.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Does it not add to the fame of that great engineer, Brunel, to read that the Clifton Suspension Bridge, which was erected fifty years ago, has never, since its construction, been closed to traffic for a single hour, night or day, and that the repairs that have been executed during this long period have been only of a very trivial description? When we consider the exposed position of this bridge, do not these facts speak well for the engineer and the contractor?

* * * *

Does not the paper by Mr. Goldbeck on "Causes of Cracks in Concrete Pavements," in the issue of THE SURVEYOR of the 23rd ult., make us wonder how concrete roads ever survive the attacks of temperature, moisture, traffic, &c.? Does he not elaborate the effect of these enemies to concrete roads in such a manner as would almost make us despair that we could ever overcome them? But when we read the last paragraph, or conclusions, of this paper, is it not a relief to find that if certain simple precautions are taken, which, by the way, are generally adopted by engineers, all these causes of failure should disappear?

* * * *

Is it not rather interesting to read that the American Society of Civil Engineers have been trying to estimate the average earnings of American civil engineers, and that the committee appointed to investigate the subject has produced a report fixing the yearly emoluments at 3,985 dollars (say £800 a year)? If the same investigations could be made in this country would not the result show a much less sum than this, especially during the war?

* * * *

Will the "Safety First" Council be able to alter the present practice of pedestrians keeping to the right on the footpath, and induce the public to keep to the left, which is evidently safer for many reasons? Will it not be a difficult matter to alter a custom and habit which is of very long standing? Will the council be able to influence the Chief Commissioner of the Metropolitan Police to make an order that pedestrians shall keep to the left, and instruct the police to see that the order is obeyed, or will the council obtain the services of a large number of people who, by persistently keeping to the left, will gradually induce others to follow their example?

* * * *

Apropos of the above, what was the original factor that made pedestrians keep to the right? Was it when men mostly carried swords which required room when drawn out and flourished in their right hands? Was it because the hat was raised and flourished in the right hand and required space for this action, or was it because carters, leading horses, preferred the surface of the pavement to that of the road?

* * * *

Was not a very novel and ingenious method of advertising adopted in THE SURVEYOR recently, when at intervals extending over several months a whole page was devoted to a single letter of the alphabet, forming part of the trade name of the new process for combating corrosion difficulties in metal and other materials, and rendering brickwork, concrete, and stone impervious to moisture? Were we not all wondering what would be the final word, and until it was revealed in last week's issue, were not our feelings somewhat akin to those of persons consumed by curiosity when reading a novel, who turn to the last pages of the book to see "how it all ends"?

* * * *

Is not Mr. Lawrence W. Chubb's paper on "Highways and Byways," which he gave to the Royal Society of Arts, a most interesting and intellectual summary of the question of the public rights on the "King's Highway"? As to the question which arose during the discussion, as to why so many traces of the ancient Roman roads in this country have disappeared, was this principally because, following the Roman occupation of this country, nearly everything useful seems to have been neglected and allowed to pass into decay?

Correspondence.

Εἰς ἀνὴρ οὐ πάντ' ὁρᾷ.

(One man does not see everything.)—Euripides.

USE OF STUDS ON ROAD LOCOMOTIVE WHEELS.

To the Editor of The Surveyor.

Sir,—The road surveyors to public bodies throughout the country can only have one opinion regarding the Order issued by the Local Government Board withdrawing, during the duration of the war, the restrictions prohibiting the use of studs in the driving wheels of locomotives. Public roads at the present time seem to be of very little importance. The labour upon them has been cut down by 50 per cent, and it has become exceedingly difficult to obtain material. If the traffic had correspondingly decreased there would be nothing wrong, but in many rural districts there has never been so much heavy traffic to contend with as at present. The haulage of timber alone is abnormal. With the increased cultivation of land there must follow an increase of traffic. Halve your labour and material, and increase the traffic, and allow what was previously illegal destruction to go on, and what follows?

The Traction Engine Owners Association are powerful; they have the sympathy of the agriculturists, and the combined body have now evidently the full sympathy of the Local Government Board. There are two sides to every question, but in this matter only one has a chance. On the one side the traction-engine owner pleads that his engine cannot travel on slippery roads with smooth wheels—granted. The farmer says that he must have fodder for his cattle during the winter months—also granted. The same trouble existed before the war, and many attempts were made to have the restrictions removed; they have not succeeded until now, but the illegal use of studs has, nevertheless, been practised, and what has been done to stop it? Certainly not the fines of a shilling per time with the sympathy of "His Lordship" thrown in. I have no hesitation in saying that, had the Locomotive Act been rigidly enforced, the present difficulties would to a very large extent have been overcome. There are other means of threshing corn than by heavy travelling machinery. Many leading farmers are now in a position to provide fodder for their cattle during the winter months without the assistance of the travelling locomotive. It only needs the enforcing of the law to put practically every farmer in the same independent position. Traction-engines may for a long time serve their useful purpose for threshing of corn, or baling hay in large bulks, but the time is overdue when every farmer should, with the assistance of an oil-engine, be able to provide fodder for his cattle during the period of bad weather without the assistance of outside help.

Oil-engines and threshing machines are inexpensive in normal times, and the working expenses are small. I believe in an incredibly short time the capital cost of the plant is covered by sums which are saved for hires.

In the process of time we find the means of reaping and threshing are regarded something like this—

Sickle	Flail.
Scythe and [illegible]	Portable horse-drawn engine.
Horse [illegible]	Self-propelled traction engines and oil engines.

To follow—

Motors to reap, thresh, and haul the corn.

When the oil engines and the motors come into their own—which they certainly will do—there will be no more excuses for the scarifying of the King's highways.

What is the other side of the question? This is part of it. Many public highways which were previously to the running of motors required almost entirely for agricultural purposes are now needed for other important traffic, and they are becoming more and more worn. Where roads are extensively used by motors with inflated and other rubber tyres, it has been proved beyond dispute that they can only be maintained in satisfactory repair by using bituminous binding, so as to make them proof against the penetration of water. Under the old system they are easily destroyed and exceedingly expensive to maintain, and they cause a nuisance by dust in the summer and mud in the winter. Thousands of miles of tar-bituminous roads have been provided during the last six years at a very heavy expenditure. This outlay has to a large extent been met by Government grants derived from the taxation of motorists, and undoubtedly this new order by the Local Government Board will, if it remains in force, be the means of undoing this excellent work. I recently examined a stretch of excellent tar-macadamed road, and found that an engine which had gone over it with studs had made 10,560 punctures per mile for one journey; another had made double this number. Some of the holes were 1½ in. deep, and the edges fractured. In both cases a detour might have been made and the tar-macadam saved the damage, but there is no consideration given at all by many drivers, whose only thought is to "get there" by the shortest and quickest way.

There is a desperate amount of overlapping, and I know of numerous cases where ten times more travelling has been done than was actually necessary, and where it might have been avoided with a little organisation. This is serious, especially when engines shifting after dark put in the studs at a small section of ice-bound road, and do not take them out when they come to stretches of perfectly clean surfaces, as in the dark there might be other small sections to encounter where it was actually slippery; and so miles of unnecessary scarifying goes on.

The overlapping will not be so easily understood by English readers.

In England the stacks are large and the barns for storing the threshed corn are correspondingly large. In Scotland the stacks and barns are small, and there are three to four visits made to farms in the latter country compared to one in the former. A dozen visits to a comparatively small farm in Scotland to thresh the season's crop is quite a common arrangement.

Competition amongst the threshing-engine proprietors in Scotland is keener than in the parts of England with which I am well acquainted; this may be good for the farmer, but it is bad for the road engineer.

The system of small stacks, occupying a few hours to thresh, lends itself to the modern use of oil-engine or motor.

Now that the ordinary layman sees how simply and inexpensive they are to work the timidness (of those with little or no mechanical knowledge) is gradually wearing off, and it is, in my opinion, a matter of only a few years when an "all-round" motor for agricultural work will be the rule.

The term "frost-bound" mentioned in the Order includes, of course, clean surfaces, and not merely those actually ice or snow bound.

The tar-treated waterproof road is not a fancy road put down simply to please the motorists. It is put down because nothing else will withstand the modern traffic, and if it is allowed to be broken up, and Government grants were to cease for this class of work, it would become a serious burden on the local ratepayer, and the agriculturist would himself have a serious cause to complain.

The county road surveyor at the present stage is not to be envied. He has half the usual labour at his disposal, difficulties in getting supplies of material, and increased traffic to keep going, and he is now to see miles of trunk roads scarified without power to interfere. Roadmen also are human, and I have myself had to use considerable persuasion to keep men from giving up their places in disgust. A man taking a proper interest in his work (and this is a man worth keeping) cannot tolerate seeing the result of his labour mutilated.

It is not generally known that, while in England all locomotives are registered and taxed if used for hauling, there is no such arrangement North of the Tweed. In that happy land the fortunate owners of such machinery have nothing to worry about.

Heavy locomotives were practically out of control before the Local Government Board conferred these last favours upon them; they are entirely so now.

At the last International Road Congress the foreign delegates who inspected many of the main roads in this country were unanimous in their opinion that the British roads were the best in the world. Is it not a pity to see them destroyed? They will be wanted later on.

Every British road engineer can rise to the occasion and provide suitable roads to meet the requirements of the day, but he cannot do this if his good work is to be mutilated. Both sides of this important question must have equal consideration.—Yours, &c.,

SCOTTISH COUNTY ROAD SURVEYOR.

February 24, 1917.

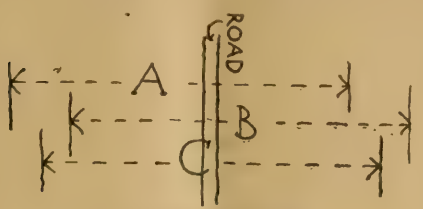
CIVIC SURVEY OF SOUTH-EAST LANCASHIRE.

To the Editor of THE SURVEYOR.

SIR,—I do not intend to occupy much of your space with a discussion which, without illustrations, is almost impossible to follow. I must say, however, that I am glad that my letter unmasked the feeling which I realised underlay the passing reference by the writer of your town-planning article, though I regret that it did not draw forth his name. His reply shows that he was frankly hostile to the Civic Survey, which he treats with uniform unfairness; and I do not regret that I omitted his "damning faint praise" in my former letter.

One point, however, I must take. The "writer of the letter" endeavours to call up the evil passions of professional men by trying to put architects against surveyors; but I am happy to say the work of the Civic Survey has been undertaken by fully-qualified surveyors as well as architects, though the fortunes of war have left more architects in need of this work than surveyors. We have also had, with one or two exceptions, the greatest help and encouragement from county, borough, urban and rural district surveyors, and I am glad to say they have expressed their general approval.

As to the traffic plan, I regret that the writer did not read my letter more carefully—he is still harping on the fact that it does not give every surveyor in S.E. Lancashire full information as to necessary width of every road, the quality of surface required, &c.; in fact, that it is not an encyclopædia instead



A. Morning's maximum.
B. Evening's maximum.
C. Average maximum.

of a single plan. If the writer had ever thought beyond his parish pump he would have known that a plan showing the general streams of traffic of South-eastern Lancashire was a useful production, though it was not the elixir of the road problem. The particular inaccuracy he quotes, as vilifying the whole plan, is simply explained: the *maximum* traffic on a certain road between Pendlebury and Manchester is about the same during two hours of the day, one in the morning, the other in the evening; only in one case the outgoing, and in the other the ingoing, is slightly the greater (the total being the same). On our plan we showed the morning's maximum; if we had taken the evening's as well, and struck an average, we should have got the *same width of traffic line*, but it would have been ¼ in. further to one side than our plan (15 ft. by 12 ft.) shows it. If the writer of your article had used our plan for the purpose of suggesting a road-widening (for which detailed use it was not intended), he would, I suppose, have widened his road on one side *only*: but I would point out to him the evening's traffic on the other side would have found the widening just as useful, as it is not the practice to put a fence down the middle of our roads. The accompanying diagram will, perhaps, explain the matter more clearly.

As to the detailed nature of the traffic, this can be ascertained by a reference to the census sheets, modelled on the Road Board's, which, of course, must be used in company with the plan. The criticism of the local municipal engineer at the meeting referred to amounted to an interesting explanation of a certain feature of the plan: a similar commentary on the whole plan, compiled from local knowledge, will be extremely valuable, as the plan itself only records phenomena, and does not explain them.

No, we do not think the work at all stupendous, and were quite aware that the surveyors of the seventy local authorities were taking much more detailed information in August, 1914; if they had completed it, we should have probably compiled our plan from the information which, we do not doubt, they would have been kind enough to give us. But I would point out that if each local authority had two men on the job, they would have had 140 at work; our staff consisted of twelve. We do not suggest that this staff has done the work of 140, but only a small fragment of it—just enough to produce a general road-traffic plan of S.W. Lancashire, which I modestly claim is neither "misleading nor inadequate," to give some idea of the nature of the problem before the general public and local authorities. If only the war had not broken out, we should have had the much fuller information—the Road Board or Board of Trade might have produced this general plan, and your writer would have been happy and contented.

His remarks on the other plans show that he had not taken the trouble to look at them with understanding: there was no 1/2500 plan prepared for water engineers at all, and the other plan, the "futurist art" one, is not very clearly indicated in his letter: I know some people find a plan hard to read if it has more than two colours upon it.—Yours, &c.,

PATRICK ABERCROMBIE,
Hon. Director, Civic Survey of South Lancashire.

Liverpool,
February 20th, 1917.

CREMATION AND PREMATURE BURIAL.

To the Editor of THE SURVEYOR.

SIR,—The allusion to cremation in your excellent journal of the 9th inst. reminds one that on p. 325 of the second edition of "Premature Burial and How it may be Prevented," by Walter R. Hadwen, M.D., &c., is the following: "While agreeing with this distinguished authority (the late Sir Henry Thompson, F.R.C.S.) as to the advantages of cremation from the sanitary and æsthetic points of view, which he dwells upon in the treatise ('Cremation') referred to, and admitting that a certain amount of protection against live burial is obtainable by means of the dual medical inspection, we cannot agree that this protection is absolute. Cases of trance are on record where some half a dozen doctors, after careful examinations, have pronounced a cataleptic patient to be dead, and the patient, in defiance of their united opinion, has recovered consciousness and been restored to health." The only way to insure that people are not buried alive is to wait until putrefactive decomposition has unmistakably set in before the disposal of a body. And the Association for the Prevention of Premature Burial advocates the establishment of waiting mortuaries where the apparently dead can be watched and kept until resuscitation takes place or death is scientifically proved to have occurred.—Yours, &c.,

JAS. R. WILLIAMSON.

100 Chedington-road,
Upper Edmonton, N.
February 17, 1917.

BUILDING BY-LAWS.

To the Editor of THE SURVEYOR.

SIR,—We are on the eve of the most radical change in house-building since the year 1666. Before the great Fire of London the people dwelt in low, dark, wooden houses, but as five-sixths of the City of London and 132,000 houses were burnt out, it was necessary to rebuild in brick to prevent future fires.

The problem before the British authorities is different, inasmuch as fire does not play any part in the great need there is for cottages. There are two causes of the dearth of houses, and they are both well known and acknowledged.

I think the remedy has already been partially solved by the British Government in the manner

adopted in building hundreds of houses for the municipalities.

Some of your readers will be surprised to learn that hundreds of houses have been erected with 9-in. coke breeze exterior walls, the walls and roof being supported by coke-breeze piers. The exterior has been rendered with two coats of Pudlocel cement, and in no case have any complaints been received as to instability or dampness.

It would be just as consistent to complain of the inability of a sheet of glass ¼-in. thick to keep out driving rains and other inclement weather, as to argue that a ½-in. waterproofed cement could not accomplish the same purpose.

The tendency is to build commodious sun-swept houses which are sufficiently stable to be weather-proof. The man who can invent anything towards this end should certainly receive due consideration by the committee which will undoubtedly be appointed (at the end of the war) to investigate the quickest and best means of housing British workers.—Yours, &c.,

J. H. Kerner-Greenwood.

February 27th, 1917.

To the Editor of The Surveyor.

Sir,—In the last part of Mr. Gordon Allen's letter, published in your issue of the 16th inst., he states that he is erecting a tiny cottage for an agricultural worker the drainage from which consists of merely sink waste. But the local authority insists upon a cesspool being built.

In my district the council would under similar circumstances not require a sink or drain at all if it could be shown that the slop water from the cottage would be small in quantity and could be satisfactorily disposed of by being thrown on to the garden away from the house without causing a nuisance.

If, however, the owner requires a sink and drain, he must construct a watertight cesspool, with ventilator at least 50 ft. from the house, and convey the sink waste thereto by means of a sound drain, suitably intercepted and ventilated, and provided with means of access.

Will Mr. Allen point out in what way these requirements are harsh or unreasonable in view of the necessity of "keeping up a high sanitary standard"?—Yours, &c.,

Rural Surveyor.

February 26, 1917.

INSTITUTION OF CIVIL ENGINEERS.

EXTRA MEETINGS.

An extra meeting of the Institution of Civil Engineers has been called for the 12th inst., when Mr. Edgar Crammond will deliver a lecture on the subject of foreign trade and its relation to the investment of capital abroad. The chair will be taken at 5.30 p.m.

In advising us of the fixture, Dr. J. H. T. Tudsbery, the secretary of the institution, writes:—

"I take the opportunity to inform you that the council hope to arrange for the delivery, at further extra meetings, of lectures on the decimal system of coinage, weights and measures, and on the standardisation of engineering materials. It is thought that the consideration of these subjects is of special importance to engineers generally at the present time. Discussion of the issues raised by the lecturers will be invited."

INSTITUTION OF MUNICIPAL ENGINEERS.

The annual meeting of the Northern District of the institution will be held at Newcastle-on-Tyne to-morrow (Saturday).

Irish Canals. In reply to a question in the House of Commons on Friday last, it was stated that, as at present advised, the Board of Trade saw no particular reason for taking over the control of Irish canals.

Steel in Reinforced Concrete. A paper, entitled "High Tensile Steel *versus* Mild Steel for Reinforced Concrete," will be read by Mr. Arthur W. C. Shelt at a meeting of the Society of Engineers, to be held at Burlington House, Piccadilly, W., on Monday next, at 5.30 p.m.

HIGH WYCOMBE FERRO-CONCRETE BRIDGE TESTS.

In November last a new highway bridge at High Wycombe, Buckinghamshire, was officially tested under the direction of Messrs. David Balfour and Son, of Newcastle-upon-Tyne, the engineers appointed by the Local Government Board to supervise the construction and testing of the bridge, which was built in Mouchel-Hennebique ferro-concrete from the general designs of Mr. F. J. Rushbrooke, the borough surveyor, in accordance with working details prepared by Messrs. L. G. Mouchel and Partners, Limited, of Westminster.

The bridge consists of a single arch span of 30 ft. between the abutments and measures 36 ft. wide between the parapets. The carriage way is 24 ft. wide, having a 6-ft. foot-walk on each side, the parapets being formed and spandrels being also of ferro-concrete.

Provision was made for a total test load of 35 tons, made up as follows:—One steam roller, 10 tons weight; one steam traction engine, 15 tons; one lorry, laden with tree trunks, 10 tons; total weight, 35 tons.

For the purpose of registering deflection of the arch under load three sensitive deflectometers of the Mouchel type were placed on trestles in the stream beneath the bridge, instrument No. 1 being at the centre, instrument No. 2 midway between the centre and the springing on the south side, and instrument No. 3 midway between the centre and the springing on the north side.

Particulars of the tests conducted and the results observed are quoted below from the report made by Messrs. David Balfour and Son.

Test No. 1, steam roller (10 tons) on centre of bridge.—Result: No deflections.

Test No. 2, traction engine (15 tons) on centre of bridge.—Results: Deflection of three-tenths of a millimetre, or 1/85 in., at the centre of the span, but no deflection at the sides.

Test No. 3, traction engine (15 tons) with lorry (10 tons) behind.—Results: Deflection of two-tenths of a millimetre, or 1/128 in., at the centre of the span, and a deflection of one-tenth of a millimetre, or 1/256 in. at the sides.

Test No. 4, traction engine (15 tons) with lorry (10 tons) on centre with steam roller at side on centre line.—Results: Deflections of one-tenth of a millimetre, or 1/256 in., at the south side; one-tenth of a millimetre, or 1/256 in., at the north side; and three-tenths of a millimetre, or 1/85 in., at the centre of the span.

Test No. 5, Traction engine (15 tons), lorry (10 tons) and steam roller (10 tons) side by side across the centre of the bridge (total load, 35 tons).—Results: Deflections of three-tenths of a millimetre, or 1/85 in., at the south side; three-tenths of a millimetre, or 1/85 in., at the north side; seven-tenths of a millimetre, or 1/26 in., at the centre of the span.

The results stated by Messrs. D. Balfour and Son are (says *Ferro-Concrete*) sufficiently demonstrative as to the highly conservative nature of the design, for the maximum deflection of 1/36 in. under the full test load is only a shade more than 1/13000 of the span of the arch.

This implies a very high factor of safety and a reserve strength far greater than that demanded for withstanding the moving loads specified by the Local Government Board.

The excess of elastic strength possessed by the bridge over that stipulated should not be regarded either as an accidental occurrence or as an evidence of wasteful design. On the contrary, it is the result of a theory entertained by the Local Government Board to the effect that a monolithic ferro-concrete bridge structure must be considered as if it consisted of an indefinite number of longitudinal strips, each capable of acting quite independently of all other longitudinal strips making up the width of the structure. It is well known to engineers who have studied the subject of applied mechanics that a condition such as this cannot exist in an arched or other framed structure of iron or timber, and it is still more impossible in the case of monolithic ferro-concrete construction, where the absolute continuity of the material in every direction results in a condition of perfect inter-dependence and enables parts of the structure not under the direct influence of the

loading applied to contribute effectively to the resistance of those parts which are loaded or are subject to strain of any kind.

An interesting proof of the foregoing statement of fact is afforded by a comparison of Tests No. 1 and No. 5 of the bridge at High Wycombe.

Thus, in Test No. 1, when the 10-ton steam roller was placed at the centre of the span the deflection was so small that it could not be measured on the highly sensitive instrument employed. But in Test No. 5, when the 10-ton steam-roller, the 10-ton lorry, and the 15-ton traction engine were placed side by side in parallel across the centre of the span, the maximum deflection on the centre line reached seven-tenths of a millimetre.

In the first case, the 24 ft. wide roadway had one foad of 10 tons on the middle third, and if that part of the arch carrying the roadway had been capable of acting, in accordance with the Local Government Board theory, as if it were made up of three independent longitudinal strips, each 8 ft. wide, it is obvious that the load would have caused a very perceptible deflection. The reason why no deflection could be detected was that the strain caused by the 10-ton load was distributed right and left to a far greater distance than that fixed by the arbitrary limit imposed on the designers, the result being that the assistance afforded by the outer portions of the arch to the portion immediately under the load was so important that the load made practically no impression on the bridge.

On the other hand, when the three vehicles were placed side by side at the centre of the bridge, the two outer thirds of the arch were engaged in withstanding the stresses due to the two outer loads, and it must be borne in mind that each of the two outer thirds had the assistance of a strip of the arch beneath the footpath and kerb, and also beneath part of the roadway outside the outer wheels of the load. The only part of the structure then available for withstanding the stresses due to the 10-ton load over the middle third was the strip immediately beneath the load. Consequently the deflection was more perceptible than in the case of Test No. 1, and, for the reasons stated above, it was greater under the middle load than under the two outer loads.

Thus the comparison of the tests mentioned absolutely contradicts the erroneous theory to which allusion has been made, and throws useful light upon the question of the stresses in ferro-concrete.

A STREET ACCIDENT.

AN EMPLOYER'S ACTION AGAINST CORPORATION.

At Durham Civil Court, on Wednesday, Mr. Justice McCardie and a special jury heard an action in which Messrs. Waggott Brothers, a Sunderland firm of butchers, claimed an indemnity of £308 odd from the Corporation of Sunderland. On behalf of the plaintiffs it was stated that they had had to pay the money in respect of the death of a workman in their employment. Under the Workmen's Compensation Act, if the employer could show that a fatal accident was really due to the negligence of somebody else, then that other person must indemnify the employer. On June 13th last a man named Bowman was driving a butcher's cart for the plaintiffs when the horse slipped and fell, and Bowman's skull was fractured, and he died two days later. The widow claimed compensation, and was paid £300 and a small sum for costs. The road was paved with wood blocks, and was repaired in the previous March or April, when tar or pitch was put on the surface and was allowed to cover the surface of the blocks. When the weather became warm the tar turned soft and sticky, and it was on this account that the horse slipped and fell. Plaintiffs alleged that the corporation were negligent in allowing tar to be placed on the wooden blocks. For the corporation it was submitted that the fatality was the result of an ordinary street accident, and that consequently the corporation was not liable.

The jury found that the corporation was guilty of negligence, and that such negligence caused the death. They also found that the accident arose out of the man's employment.

His lord-ship deferred judgment to allow defendants an opportunity of legal argument if they desired.

WAR CONTRACTS LEGISLATION.

COURTS' EMERGENCY POWERS.

In the House of Commons on Wednesday, the Solicitor-General (Sir Gordon Hewart), in moving the second reading of the Courts (Emergency Powers) Bill, said it was introduced to meet certain practical difficulties which had arisen in the working of previous emergency legislation during the war. The Bill was divided into three parts. The first part dealt with contracts. In March, 1915, relief was given by Statute in certain cases where the fulfilment of contracts was interfered with by the necessity of complying with requirements of the Army or Navy under the Defence of the Realm Act. Experience had proved that that protection, valuable as it was, did not go far enough. It left untouched the legal position of many persons who, before the war, entered into contracts for the construction of buildings, and found that, by reason of circumstances attributable to the war, although they were not able to point to requirements of the Government, it was impossible for them, without serious hardship, to perform their contracts within that stipulated time. In general, an excellent spirit of accommodation had been shown, but there had been some hard cases, where the other parties to the contract either would not, or, because of their special position as trustees or local authorities, could not, relax the stipulations of the contract. The first clause of the Bill proposed to empower the Court in proper cases to suspend or annul the contract. The Court, however, had to be satisfied that the performance of the contract was prevented or rendered gravely onerous by difficulties due to the war, either in regard to labour or materials. An applicant might show that by reason of the war his supply or delivery of materials was prevented or restricted or delayed, or he might show that the war had occasioned diversion or insufficiency in his supply of labour. In either event, the Court might suspend or annul the contract on suitable conditions in the discretion of the Court, regard being had to all the circumstances of the case.

The Bill was read a second time.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRY HELD.

Watford U.D.C. (February 19th). Mr. R. C. Maxwell).—This was an inquiry into an application for the issue of a Provisional Order to extend the limits of the supply of water by the council in view of the contemplated extension of the council's area after the war.—Mr. W. Hudson, the clerk, stated that the inquiry had been rendered necessary by the promotion on the part of the Rickmansworth and Uxbridge Valley Water Company of a Provisional Order to extend their area, but he was pleased to say that a satisfactory agreement had been arrived at with the company with regard to the matter.—Mr. D. Waterhouse, engineer to the urban district council, described the position of the six new wells and pumping plant capable of increasing the output of water to 3¼ million gallons per 24 hours, as compared with 1,100,000 gallons hitherto. Water softening apparatus had been provided. The extra cost of the work up to date had been £65,000, and after the war it was proposed to proceed with the construction of a reservoir and main extensions which would increase the total cost to £11,000. The charge on the rateable value of the district for water purposes was 5 per cent. for domestic supplies and 15 per 1,000 gallons for trade purposes by meter.

APPLICATIONS FOR LOANS.

Norwich T.C. £3,500 for the building and equipment of an electricity sub-station.

Dorking U.D.C. £3,500 for the purchase of property for the South-street improvement.

LOAN SANCTIONED.

Hull T.C. £60,000 for extensions in the electricity department.

FORTHCOMING INQUIRY.

MARCH. £

6. **Atherton.** For the purchase of land for a housing scheme (Mr. H. A. Chapman) —

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars have reached us during the present week. Other reports will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Accrington T.C.—A proposal to build a fire station at the junction of Manchester-road and Grange-lane is being considered by the Watch Committee.

East Ham T.C.—The architect to the Education Committee has been instructed to complete plans for converting the infants' department of the school in High-street into a special centre for mentally defective children, and also the plans for a mixed school for 600 children.

Gillingham T.C.—The borough surveyor, Mr. J. L. Reitem, has been authorised to carry out painting and repairs to a number of schools during the ensuing financial year, at an estimated cost of £353.

Salford T.C.—The Education Committee recommend a scheme for the erection of a public elementary school at an estimated cost of £26,680, including £6,680 for the purchase of the land.

HOUSING AND TOWN PLANNING.

Bingley U.D.C.—The surveyor, Mr. H. Bottomley, has received instructions to prepare plans of suitable sites for workmen's houses which it is proposed to build after the war.

Birmingham T.C.—The Special Committee on Housing, whose sittings have been in abeyance since October, 1914, have resumed work by deciding to proceed with the consideration of the further recommendations they have to make to the city council. It is not intended to put any proposals into effect until after the conclusion of the war.

Coventry T.C.—The council on Tuesday had before them the scheme of the Ministry of Munitions for the erection of 214 houses on the London road, and assented to the plans presented by Mr. G. L. Pepler, town-planning inspector of the Local Government Board.

Mynyddislwyn U.D.C.—Plans are to be prepared by the architect for 200 houses, which it is proposed to build after the war at an estimated cost of £12,000.

Northfleet U.D.C.—The council will consider at the next meeting a request from the Local Government Board that they should submit plans for the proposed housing scheme on the Northfleet estate, to consist of 147 dwellings.

Paisley T.C.—The Housing and Town Planning Committee report that they have instructed the burgh surveyor, Mr. I. Lee, to prepare a plan showing what area he considers should be laid out for the erection of houses after the war. They consider that a start might be made with vacant ground in Albion-street, where 24 four-roomed houses could be built.

Sedgley U.D.C.—A sub-committee has been authorised to prepare a scheme for the erection of fifty workmen's dwellings as soon as the present restrictions upon borrowing money are withdrawn.

MOTOR TRANSPORT.

Baildon U.D.C.—The Wharfedale Hospital Board have made a proposal to the council for the joint purchase of a motor ambulance, at a cost of £600.

Bradford T.C.—The corporation are arranging for a fleet of motor lorries for the delivery of coke to the mains by horses under the work and motor the mains. A report of the street cleansing department shows that a motor sweeper does its work along a length of 3½ miles in twenty minutes, at a cost of 1s. 10d.; while the same labour takes one hour and a quarter at a cost of 3s. 9d.

Edinburgh T.C.—The purchase of a new petrol-motor fire engine is recommended by the sub-committee of the Plans and Works Committee.

Lanchester R.D.C.—It has been agreed to purchase a motor motor for haulage at a cost of £695.

Sunderland T.C.—A decision has been reached to purchase another motor fire engine.

ROADS AND MATERIALS.

Aberdeen T.C.—It has been decided to carry out widening schemes in Clifton-road and Canal-road.

Barnstaple R.D.C.—The Devon County Council have written that, so far as main road and quarry work was concerned, it was hopeless for them to get prisoners of war to do the work. Prisoners were only allowed out in big quarries somewhere in the neighbourhood of existing camps, or where there was sufficient work to justify the authorities in providing a camp. The highway surveyor, Mr. A. A. Richards, having reported that the contracts for the road expired on March 31st, it was agreed to empower him to make arrangements, if possible, to keep the same contractors at the existing prices.

Brighton T.C.—The town council last week agreed to engage some women as roads-sweepers—for some of the lighter parts of road work, such as they will be able to undertake. It is proposed to give the women uniforms and hats and to pay them 5d. per hour. It was expected, the chairman of the Works Committee stated, that it would take three women to do the work of two men.

Camberwell B.C.—The borough engineer, Mr. W. Oxtoby, in his statement with respect to the estimates for 1917-18 states that he has estimated for the same amount as last year. The roads had stood the strain of last year very well, which he considered was largely due to the tar-spraying, but he fears they will show a greater depreciation during the coming year, and it is most likely that a large number will require relining. He has again provided £1,500 for sett paving, as the wood-paved roads are getting very bad, and he considers it cheapest to lay setts by way of repairs. Many of the wood roads are getting to the end of their life, and in the near future will have to be relaid at a very heavy cost. He adds that he has provided for no Sunday or Saturday afternoon watering, and for very little day watering. Now that all the macadam roads have been tar-sprayed, and will be re-tar-sprayed some every year, some every other year, and the others every third year, he is of opinion that they require no watering. The tar-spraying can be done for very little, if any, extra expense to the cost of watering, and he is convinced that from a health point of view, as well as from an economic point of view in regard to the life of a road, it is highly beneficial, and in the future will be universal, and the old system of watering die out, but at present he does not deem it advisable to discontinue watering altogether, as on some days in market and shop centres it may be necessary.

Chorley T.C.—It has been decided to purchase a Wadsworth machine for clearing away snow, and to utilise it for scattering sand.

Essex C.C.—It is estimated by the Highways Committee that the total expenditure for 1917-18 on roads and bridges will be £201,350, comprising £98,355 for materials, team labour, £30,629 for manual labour, £46,500 urban district councils.—Alderman H. E. Brooks, at the council meeting, said that the roads in certain parts of the county were getting into a very bad state, and he was afraid they would have a very big expenditure later on.—Alderman Beal said that the Road Board were in possession of nearly all their plant; a great deal was in France. After the war, he was perfectly certain that the board would do everything possible to assist them and make good the loss on the roads.

Grays U.D.C.—The surveyor, Mr. A. C. James, has received instructions to prepare particulars of the proposed Whitehall-lane improvement, which it is proposed to carry out after the war, at an estimated cost of £5,000.

Hants C.C.—Two divisional surveyors have been released for road construction abroad, and it has been agreed to advance the salary of each of the two remaining divisional surveyors at the rate of £100 a year in consideration of their taking over an additional division of the county, and also give them an additional allowance of £80 a year in respect of travelling expenses.

Huddersfield T.C.—Plans have been completed of the proposed new road from Ashgrove-road to Dalton Bank.

Kent C.C.—It has been agreed to reinstate a number of roads in the Cheriton district at an estimated cost of £7,600, towards which the Government will make a contribution. The council will also contribute £150 towards the scheme for widening the Cheriton road at its junction with Risborough-lane.

Kirbymoorside R.D.C.—The Road Board have made a grant of £115 to the council to meet the cost of repairing the damage caused to a section of road in Swineherd-lane by timber-loading, which was being done under Government contract. It was intimated that this would not preclude the council from making a further application when the money had been expended.

Midlothian C.C.—The Suburban District Committee have agreed to a scheme of tar work to be carried out on the roads in the district during the year 1917-18, in respect of which work a grant is to be asked from the Road Board. In connection with this matter the committee had under consideration a report by the district surveyor dealing with the large amount of military traffic on the roads in the district, and also the increase in the motor-bus services consequent on the restriction of train service, and it was resolved to bring these points forcibly before the Road Board when making the application for a grant.

Morecambe T.C.—The town council are making application to the Government for a grant towards the maintenance of Lancaster-road and Torrisholme Moss-lane.

Norfolk C.C.—The Eastern Highways Committee have appointed a committee to consider a proposition by the Road Board to contribute 50 per cent of the cost of making up a section of main road in an urban area, the estimated cost of which is £1,147.—The county surveyor, Mr. W. W. Gladwell, has reported to the Eastern Highways Committee that the Bills Committee had received thirty-two tenders for gravel, chalk, &c., as against twenty-six last year; ten tenders for tools and implements as against twelve, and eighty tenders for team labour as against 154 in 1914. The committee recommended the acceptance of tenders for gravel, flint, and chalk, also for team labour, the maximum price per day for single horse, cart, and man to be 10s., and for two horses, cart, and man 16s. per day, except in the neighbourhood of Norwich and a few other localities, where a slightly higher price might have to be paid. Prices generally were higher than last year.

Westminster B.C.—The Works Committee recommend that tenders be obtained for paving with wood or asphalt part of Eccleston-street and Knightsbridge.

SEWERAGE AND SEWAGE DISPOSAL.

Axminster U.D.C.—Acting on the suggestion of the engineer, it has been agreed, in order to make the sewerage scheme complete, to carry out an extension on the Chard road at an estimated cost of £1,269. It was reported that in connection with the scheme £9,775 had been expended up to date out of a loan of £11,000. The contract price for the scheme was £8,322.

Hendon R.D.C.—The surveyor, Mr. J. A. Webb, has submitted a scheme of sewage disposal for Harrow Weald, estimated to cost £19,000. The council have agreed to send the scheme to the Local Government Board for their approval.

Lambeth B.C.—The Public Health Committee recommend the construction of new sewers in Woodland-road and Woodcote-place, at an estimated cost of £3,000. They also advise other expenditure on sewerage works amounting to £3,500.

Luton T.C.—The borough engineer, Mr. J. W. Tomlinson, has received instructions to prepare a report and estimates of the cost of improving the main sewerage system.

Newry No. 1 (Co. Down) R.D.C.—The Local Government Board for Ireland have made a Provisional Order empowering the council to put in force the provisions of the Land Clauses Act with respect to the purchase and taking, otherwise than by agreement, of certain lands for the purpose of improving the sewerage of the town of Rathfriland and its neighbourhood.

WATER, GAS, AND ELECTRICITY.

Birmingham T.C.—A meeting of the Electric Supply Committee was held on Wednesday, when their reply to the report of the special committee appointed to inquire into the affairs of the department, with particular reference to the failure to supply sufficient current for the needs of the city, was revised. The special committee made a thorough investigation of departmental matters generally. Their report contains a brief history of the department since it was acquired by the corporation from a private company, an indication of the gradual development of the undertaking, and a detailed opinion as to the causes which led to the failure to supply an adequate amount of current to the tramway department. The main reason for this failure, it is pointed out, was due to over-pressure, resulting from the heavy demands for electricity by munition factories and other establishments. The report, together with the committee's explanation of some of the comments contained in it, will be brought forward for consideration at the next meeting of the city council.

Bristol T.C.—The Works Sub-Committee of the Sanitary Committee reported that they had considered the lighting of the streets for the summer months, and as the chief constable, acting under instructions from the Government, refused to allow any improvement in the gas and incandescent electric lamps, it was decided that as those lamps were of very little benefit in the summer months, to shut them down from the first week in April to September 30th, in order that the workmen might have an opportunity of volunteering for national service. It was also decided to give an increase of 3s. per week to the workmen in the interval.

Heston and Isleworth U.D.C.—In view of the early reintroduction of summer time, the electrical engineer advises an increase to all classes of electricity consumers of 12½ per cent, which makes a total increase of 25 per cent on pre-war prices.

Loughborough T.C.—The Electricity Committee, acting upon a report by the electrical engineer, recommend considerable extensions of the electricity plant. Having regard to the difficulty in obtaining plant at the present time, it was absolutely necessary that orders should be placed at the earliest possible moment if next winter's supply was not to be jeopardised. The total extension advised would entail a cost of about £50,000, but it was recommended that only a part of the scheme should be proceeded with at present, at a cost of £27,225. This would include a larger boiler and a larger turbo set. These proposals have been approved by the town council, and the Local Government Board are being asked to sanction a loan.

Paignton U.D.C.—The Paignton Gas Company wrote intimating that, in consequence of labour difficulties, it was necessary for the company to discontinue the public lighting. Some members considered that arrangements should be made with the surveyor to get the necessary labour, and this course was adopted.

Rotherham T.C.—Steps are being taken with a view to resuming the use of the Ulley water supply for domestic consumption. Dr. Houston, of the Metropolitan Water Board, has been asked to advise the corporation on the subject. There is a reservoir at Ulley which holds a supply sufficient for about 150 days for the borough. The capital cost was £60,000, but the water has not been used by the corporation for eight years.

St. Ives T.C.—In connection with the suggestion of the borough surveyor, Mr. S. Palmer, that a scheme of supplementary water filtration should be carried out, the town council have accepted the offer of Mr. Cook, of Barnoon, St. Ives, to make, free of charge, three sets of the necessary filtering media for the purpose of testing the borough surveyor's proposal.

Southend T.C.—Having considered the extension of the generating plant in order to cope with the increasing demand for current, the Electric Lighting Committee have decided that application may be made to the Local Government Board for leave to borrow £45,520 for the provision of additional generating plant at the electricity works.

Stepney B.C.—An estimate of £20,000 has been adopted for the supply of two new boilers for the electricity undertaking.

Swindon T.C.—Additional plant is to be installed at the electricity works, at an estimated cost of £6,000.

MISCELLANEOUS.

Birmingham T.C.—An agreement has been made with the Works Committee of the Birmingham, Tame and Rea District Drainage Board for the disposal of ashes from the electric supply department. The board have taken the ashes for some years and have disposed of them at various points on their works. The arrangement now made is that for an agreed period the board shall deal with about 70,000 tons per annum. This entails considerable work, involving the purchase of canal boats, horses, tip wagons, and 2-ft. gauge railway, but no time will be lost in providing the necessary equipment and in carrying the proposal into effect.

Scrapping the Tramways.—On Wednesday, when the Lancaster Town Council decided to purchase two more motor 'buses of English make, in order to cope with the demand in the town, the chairman of the Tramways Committee said he believed the time was coming when it would pay the corporation to scrap the electric tramways, and to go in for electric motor 'buses.

FOR OTHER ADVERTISEMENTS
See End of Paper.

WANTED - Temporary Assistant Surveyor and Sanitary Inspector (ineligible for Army). Applications, stating age, experience, and salary, inclusive of travelling expenses required, together with copies of testimonials, to be sent to—

R. J. KNAPMAN,
Surveyor and Sanitary Engineer, &c.,
R.D. Council Offices
Whiston,
Prescot, Lancs.

(3,344)

SOUTHALL-NORWOOD URBAN DISTRICT COUNCIL.

ANNUAL CONTRACTS.

From 1st APRIL, 1917, to 31st MARCH, 1918.

The Council invite Tenders for the Supply of—

Granite (Guernsey and Leicestershire).
Lime (Clay Cross and Grey Lime).
Press Cloth.
Carbolic Powder and Acid.
Brooms and Dustbins.
Flints, Hoggin and Gravel.
Horse Hire.
Steam Rolling and Scarifying.
Coal Tar and Oil Tar.

Forms of Tender and particulars can be obtained at the Office of the undersigned any day between the hours of 10 a.m. and 4 p.m. (except Saturdays, 10 a.m. to 1 p.m.). Forms will only be supplied for the items mentioned above, and, to reduce clerical labour, Forms will not be supplied to applicants who have in previous years asked for Forms and have not returned Tenders.

Tenders, sealed and endorsed "Tender for ....," are to be delivered to the Clerk of the Council not later than 4 p.m. on the 13th March, 1917.

The Council do not bind themselves to accept the lowest or any Tender, and may accept part or parts of any Tender.

REGINALD BROWN, Assoc.M.Inst.C.E., &c.,
Engineer and Surveyor to the Council.

Town Hall, Southall
February 21, 1917 (3,342)

STOKE NEWINGTON.

METROPOLITAN BOROUGH OF STOKE NEWINGTON.

The Council invite Tenders for the following Works and Supplies—viz.:

Mason and Paviors' Work.
Carriage of Road Materials, &c.
Water Pipe and Plumbing Work.
Removal of Clinker from Destructor.
Supply of Lime and Cement.
Supply of Drain Pipes, Bends, Bricks, &c.
Supply of Brooms, Tools, and Castings.
Supply of Hay, Straw and Provender.

For particulars and Form of Tender apply to the Surveyor, Town Hall, Milton-road, Stoke Newington.

Sealed and endorsed Tenders to be delivered at the Town Hall by 4 o'clock p.m. on Tuesday, 13th March, 1917.

SIDNEY WHITE,
Town Clerk.

(3,343)

PERSONAL.

Mr. J. P. Cargill, health department, Salford, has been elected a member of the Royal Sanitary Institute.

Mr. F. C. Donaldson, Manchester, has been appointed an assistant in the borough engineer's department, Wigan.

Mr. W. Lionel Jenkins, county surveyor for West Suffolk, has taken up a commission in the Royal Engineers (road construction).

Mr. H. Steuart, assistant burgh surveyor, Aberdeen, has been elected a member of the Institution of Municipal and County Engineers.

Mr. T. R. Swales, borough engineer and surveyor of Maldon, has obtained a commission in the Royal Engineers, for road service in France.

Sir Maurice Fitzmaurice has been appointed chairman of the Committee to Control Canals, which were taken over by the State as from yesterday.

Mr. W. Sowerby, articled pupil to Mr. H. Holmes, Ossett, has been elected to studentship of the Institution of Municipal and County Engineers.

Mr. E. Winfield, chief assistant, has been appointed acting surveyor of Bucks during the absence of the county surveyor, Mr. R. J. Thomas, on military service.

Mr. A. W. Grace, engineer and surveyor to the borough corporation of Launceston, has been elected a member of the Institution of Municipal and County Engineers.

Mr. J. D. Blakeney, assistant engineer and superintendent of works to the British Municipal Council, Tientsin, has been elected an associate member of the Institution of Municipal and County Engineers.

Mr. John Schooler, county road surveyor, Fort William, having been elected a member of the Road Surveyors' Association of Scotland, has had his name added to the roll of the Institution of Municipal and County Engineers as an affiliated member.

Mr. Charles Wood, engineer and manager of the gas department of Bradford Corporation, has been appointed a member of the Corbet Woodall Scholarship Advisory Committee in connection with the University of Leeds, in succession to the late Mr. J. C. Newbigging, engineer to the gas department of the Corporation of Manchester.

KILLED IN ACTION.

Mr. H. G. Stewart-Moore, engineer to the Trustees of the Drainage District of Lough Neagh, has been killed in action at Salonika.

OBITUARY.

Mr. W. J. O'Neill, engineer to the Trustees of the Drainage District of Lough Neagh for upwards of fifty years, died recently, we regret to state. Mr. O'Neill retired from service some time ago.

Mr. William Hunter, M.Inst.C.E., for twenty years chief engineer of the Manchester Ship Canal Company, died on Tuesday at Woodley, near Manchester. He was a past-president of the Manchester Association of Engineers, and a member of the Technical Committee which reported upon the Panama Canal.

Mr. Samuel Arthur Goodall, who had been surveyor to the Fenton Urban District Council for thirty-six years, until the Federation of the Potteries, when he retired, died recently, we regret to state, at the age of seventy-three. His eldest son, Mr. A. A. Goodall, is surveyor to the Rhyl Urban District Council.

Scarcity of Water Taps.—Owing to the difficulty of obtaining supplies of special types of water taps, the Ministry of Munitions recommends all water engineers to relax their regulations, and to accept any effective substitute.

Change of Address.—Owing to the fact that their premises have been commandeered by the Government, Messrs. Mossay and Co., Ltd., have removed to new offices at 7, Princes-street, Westminster, S.W. Telephone No. 2269 Victoria (as before).

St. Paul's Bridge.—The City of London Corporation have applied to the Local Government Board for an extension until August 18, 1918, of the time-limit for the exercise of the statutory powers of compulsory purchase of land in the City and the borough of Southwark, likely to be required for the erection of the new St. Paul's Bridge and its approaches.

ASHBINS AND PUBLIC HEALTH.

PROPERTY OWNER'S UNSUCCESSFUL PLEA.

A case of considerable interest to local authorities was before the Altrincham, Cheshire, magistrates on Monday, when the Hale Urban District Council claimed £1 11s. 6d. from James Haynes Batchelor, of Altrincham, for three ashbins supplied to property owned by the defendant at Hale.

It was defendant's case that, having repaired the ashbins, he had thought that was sufficient, and he wrote to the council expressing his surprise that they should require new ashbins at the present moment when the Government requested economy. The council's letter implied that the Government's request must be ignored.

The council's reply was that the requirements of the authority were essential in the interests of the health of the district, and that it was in the interests of true economy that the sanitary arrangements of the district should be kept in order.

The defendant said he had on the court premises two of the ashbins which he had repaired, and he would ask the Bench to say if such repairs were not sufficient, having regard to the present time. He objected to putting new ashbins in while the Government were asking everyone to economise in materials and labour and to save every shilling. He further claimed that the matter was not of a nature to be a sanitary danger. Further, substantial ashbins could not be bought to-day; those that were purchasable were only like tissue paper.

The chairman said a great deal had been said that had nothing whatever to do with the case. This talk about economy was all very well and proper, but one could not economise at the present time with the health of the community. The council all round had been extremely moderate, and the Bench were quite sure that what was asked for had been essential. An order would be made requiring the defendant to pay £1 11s. 6d. for the ashbins the council had supplied, and 29s. costs, including one guinea for advocate's fee.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

INSPECTOR OF NUISANCES.—March 5th. Guildford Town Council.—Mr. A. D. Jenkins, town clerk, Guildford.

SANITARY INSPECTOR.—March 9th.—Caistor Rural District Council. £165 a year.—Mr. A. A. Padley, clerk, Council Offices, Caistor.

Buildings.

SHEERNESS.—March 14th. For the construction of pumping station buildings and other works, for the urban district council.—The Water Engineer, Trinity-road, Sheerness.

LONDON.—For the execution of ordinary works and repairs to buildings, for H.M. Commissioner of Works.—The Secretary, H.M. Office of Works, Storey's-gate, London, S.W.

Engineering: Iron and Steel.

HARROGATE.—March 5th.—For the supply at the electricity works of a by-product steam boiler, overhead coal bunker, coal conveyer, and structural steelwork, for the corporation.—Mr. G. Wilkinson, borough electrical engineer, 33 Swan-road, Harrogate.

MANCHESTER.—March 7th.—For the supply and erection of a coal-conveying plant and suction ash plant, for the electricity committee.—Mr. F. E. Hughes, secretary, Electricity Department, Town Hall, Manchester.

SWANSEA.—March 10th.—For the supply of cast-iron pipes and specials, waterworks appliances, including valves and hydrants, water meters, pig lead, and steel tubes and fittings, for the corporation.—Mr. H. Lang Coath, town clerk, Guildhall, Swansea.

COVENTRY.—March 12th.—For the supply of cast-iron pipes, lead pipes, solder, and hydrant and valve boxes, for the Waterworks and Fire Brigade Committee.—Mr. J. E. Swindlehurst, water engineer, Council House, Coventry.

MANCHESTER.—March 14th.—For the supply of nine 40-h.p. three-phase slip-ring motors, for the Electricity Committee.—Mr. F. E. Hughes, secretary, Electricity Department, Town Hall, Manchester.

Mechanically Propelled Vehicles.

BRIGHTON.—March 9th.—For the supply of a steam motor wagon and an electric motor wagon, for the corporation.—Mr. H. Talbot, town clerk.

Roads.

SOUTHWELL.—March 5th.—For the supply of road materials, for the rural district council.—Mr. J. Ellis, clerk, Southwell.

HUNSLET.—March 5th.—For the supply of highway material, for the rural district council.—Mr. W. B. Pindar, clerk, Leak-street, Hunslet, Leeds.

LOUGHBOROUGH.—March 5th.—For the supply of broken granite, for the corporation.—Mr. A. H. Walker, borough surveyor, Town Hall, Loughborough.

NEWMARKET.—March 5th.—For the supply of 3,000 tons of 2½-in. best broken Leicestershire granite, 3,750 tons of 1½-in., and 170 tons of granite chippings, for the rural district council.—Mr. F. J. Blackbourn, acting clerk, Deva-chambers, Newmarket.

HORNCASTLE.—March 5th.—For the supply of 260 tons of X granite, 300 tons of XX granite, 150 tons of X slag, and 70 tons of slag or granite chips, for the urban district council.—The acting surveyor, Court House, Horncastle.

SUNBURY-ON-THAMES.—March 5th.—For the supply of 500 tons of Guernsey, Clee Hill, Burdon Hill, or Charnwood granite, and 300 tons of slag tar macadam, for the urban district council.—Mr. H. F. Coales, surveyor, Council Offices.

WINCANTON.—March 6th.—For the supply of basalt, granite, limestone, quartzite, and tar-macadam, for the rural district council. — Mr. E. H. Knapman, district surveyor, Wincanton.

UPPINGHAM.—March 6th. — For the supply of about 4,000 tons of broken granite and screenings, for the rural district council.—Mr. F. Oakley, clerk, Council Offices, Uppingham.

CHINGFORD.—March 6th.—For the supply of broken British, Guernsey, or Quenast granite, stone ballast, hoggin, boiler clinker, refined or distilled tar, team labour, use of steam roller and scarifier and the collection of refuse, for the urban district council.—Mr. L. C. Bowen, clerk, 34, Station-road, Chingford.

WEST SUFFOLK.—March 6th.—For the supply of broken material (tarred and untarred), for the county council.—Mr. T. W. Morgan, acting county surveyor, Shire Hall, Bury St. Edmunds.

STROOD.—March 7th.—For the supply of Guernsey granite spalls, broken Guernsey and other granites, quartzite, and basalt, Kentish rag, surface-picked and grubbed flints, local pit flints, and dehydrated tar, for the rural district council.—Mr. J. E. Povey, clerk, Council Offices, Stroud.

BLYTHING.—March 7th.—For the supply of 5,500 tons of granite, granite chips and flints, for the rural district council.—Mr. H. A. Mullens, clerk, Council Offices, Bulcamp, Halesworth.

PETERBOROUGH.—March 7th.—For the supply of gravel, granite and team labour, for the rural district council. Mr. W. B. Buckle, clerk, 49 Priestgate, Peterborough.

FLEET.—March 8th.—For the provision of horse and team for street watering, and the supply of 5,000 gallons of tar, for the urban district council.—The Surveyor, Council Offices, Fleet, Hants.

STAFFS.—March 8th.—For the supply of cartage, road materials, and tools, for the county council.—Mr. J. Moncur, county surveyor, County Buildings, Stafford.

TADCASTER.—March 8th.—For the supply of road material, stores and carting, for the rural district council.—Mr. T. Scott, surveyor, Aberford, Leeds.

EPPING.—March 8th.—For the supply of gravel and materials, for the rural district council.—Mr. F. Forrester, surveyor, Thornwood, near Epping.

CAISTOR.—March 8th.—For the supply of about 20,000 gallons of refined or distilled tar, for the rural district council.—Mr. A. A. Padley, clerk, Council Offices, Caistor.

BINGLEY.—March 9th.—For the supply of granite, tarred slag, tarred limestone, limestone, lime, pitch and oil, tar and sanitary pipes, for the urban district council.—Mr. H. Bottomley, engineer and surveyor, Town Hall, Bingley.

SEDGEFIELD.—March 9th.—For the supply of road metal, concrete kerbstones and flags, sanitary pipes, cartage and team labour, for the rural district council.—Mr. W. R. Plews, highway surveyor, 6 South-view, Ferryhill, Durham.

MORLEY.—March 9th.—For the supply of limestone, Portland cement and lime, earthenware pipes and gullies, brooms and brushes, pitch and creosote oil, flags, setts, kerbs, sand and iron castings, for the corporation.—Mr. F. Turner, borough engineer, Town Hall.

DURHAM.—March 9th.—For the supply of whinstone, slag, tar-macadam, and tar, for the rural district council.—Mr. G. Gregson, surveyor, 38 Saddler-street, Durham.

SEVENOAKS.—March 10th.—For the supply of granite quartz, basalt or other approved hardstone, team labour and cartage and haulage, for the rural district council.—Mr. F. H. Vibert, clerk, Bank Chambers, 82 High-street, Sevenoaks.

WILLINGTON.—March 10th.—For the supply of carting and horse hire, mason work, road metal, and scavenging, for the urban district council.—Mr. J. H. Gardner, surveyor, Willington, Durham.

DURHAM.—March 10th.—For the supply of broken whinstone, broken limestone, broken slag, rough slag, tarred slag, tarred limestone, distilled and prepared tar, tools, team labour, cartage, and sanitary pipes, for the county council.—Mr. A. E. Brookes, county surveyor, Shire Hall, Durham.

SHEPTON MALLET.—March 10th.—For cleansing the highways, street watering, steam rolling and scarifying, and the supply of road materials, for the urban district council.—The Acting Surveyor, Council Offices.

BUCKLOW.—March 12th.—For the supply of granite setts, grit setts, broken granite and slag, chippings, cinders, road grids, tools, and paving, for the rural district council.—Mr. R. Curtis Corden, highway surveyor, Knutsford, Cheshire.

LEAMINGTON.—March 12th.—For the supply of about 2,500 tons of paving-stone, for the corporation.—The road surveyor, Adelaide-road Depot, Leamington.

KNARESBOROUGH.—March 13th.—For the supply of whinstone, granite, annealed and ironstone slag, and tar, for the rural district council.—Mr. H. J. Halstead, highway surveyor, 14 Bower-road, Harrogate.

CARSHALTON.—March 13th.—For treating about 14,000 square yards of road with bituminous binder-preventing material, for the urban district council.—Mr. C. P. Lovelock, clerk, District Council Offices, The Square, Carshalton, Surrey.

CARSHALTON.—March 13th.—For the supply of [illegible] tons of 2½ in. and 400 tons of 1½ in., or 1,000 tons of mixed gauge cold-blast tarred slag macadam, of best quality, for the urban district council.—Mr. W. Gale, surveyor, District Council Offices, The Square, Carshalton, Surrey.

WALSALL.—March 13th.—For the supply of broken furnace slag, broken granite, and stoneware pipes, for the rural district council.—Mr. W. P. Young, district surveyor, Council Offices, Daw End, Rushall, Walsall.

AYLESBURY.—March 14th.—For the supply of clean hand-picked field flints, granite, furnace slag, Derbyshire limestone and refined tar, for the rural district council.—Mr. H. G. Cordon, highway surveyor, 21, Walton-street, Aylesbury.

HOLLINGBOURN.—March 14th.—For the supply of road materials, for the rural district council.—Mr. H. J. Bracher, clerk, 33 Earl-street, Maidstone.

ST. HELENS.—March 17th.—For the supply of macadam, granite chippings, limestone chippings, granite setts, kerbs, channels, grit setts, concrete flags, sand and tarred macadam, for the corporation.—Borough Engineer, Town Hall, St. Helens.

HORSHAM.—March 17th.—For the supply of flints, granite, granite chippings and sand, for the rural district council.—Mr. W. Dengate, surveyor, 58 Park-street, Horsham.

KIVETON PARK.—March 17th.—For the supply of broken slag, granite, and tar macadam, for the rural district council.—Mr. F. Hewitt, surveyor, council offices, Kiveton Park Station, near Sheffield.

EPSOM.—March 19th.—For the supply of granite chippings, dug flints, fine gravel, sand, stoneware pipes, and team labour, for the rural district council.—Mr. T. E. Ware, surveyor, Waterloo-road, Epsom.

ELY.—March 21st.—For the supply of 2,930 tons of granite and 1,050 tons of gravel, for the rural district council.—Mr. F. W. Firby, district surveyor, Sutton, Isle of Ely.

CHAILEY.—March 22nd.—For the supply of about 2,980 yds. of flints, 2,550 yds. of granite or other stone, and 60 yds. of gravel, for the rural district council.—Mr. C. Patrick, clerk, Union Offices, West-street, Lewes.

Sanitary.

NEWCASTLE-ON-TYNE.—March 5th.—For the removal of house refuse, for the corporation.—Acting City Engineer, Town Hall.

BEDLINGTON.—March 5th.—For the removal of the contents of privies and ashpits, for the urban district council.—Mr. J. E. Johnston, surveyor, Council Offices.

LLANDAFF AND DINAS POWIS.—March 7th.—For horsing scavenging wagons and removing house refuse, for the rural district council.—Mr. M. Warren, clerk, Park House, 20, Park-place, Cardiff.

HOWDEN.—March 8th.—For scavenging, for the rural district council.—Mr. H. Green, clerk, Howden.

WEST HAM.—March 8th.—For the supply of disinfectants, for the Education Committee. Town Clerk, 95, The Grove, Stratford.

ALNWICK.—March 12th.—For cleansing ashpits and carting ash-box refuse, for the rural district council.—Mr. H. W. Walton, clerk.

KEIGHLEY.—March 12th.—For emptying privies and ashpits, for the rural district council.—Mr. T. Burton, inspector of nuisances, Market Chambers, Keighley.

ST. MELLONS.—March 13th.—For scavenging in certain parishes, for the rural district council.—The Clerk, Union Offices, Queen's Hill, Newport, Mon.

FAREHAM.—March 13th.—For house scavenging and emptying cesspools, for the rural district council.—Mr. A. Laker, clerk, 97 West-street, Fareham.

CAERPHILLY.—March 20th.—For scavenging various districts, for the urban district council.—Mr. T. H. Richards, surveyor.

Stores.

BEDWELLTY.—March 5th.—For the supply of 2,400 tons of coal, 120 tons of white lime, limestone metalling and gravel, and basalt metalling and gravel, for the urban district council.—Mr. Dan H. Price, engineer and surveyor, Aberbargoed.

COLCHESTER.—March 7th.—For the supply of Derbyshire stone, lime, granite kerbing, granite setts, broken granite, Kettering iron slag, tar-macadam, broken Kentish ragstone, Kentish sifted red flints, Portland cement, glazed stoneware sewer

pipes, junctions, bends, traps, taper pipes and gullies, for the corporation.—Mr. H. Collins, borough engineer and surveyor, Town Hall, Colchester.

RICHMOND (Surrey).—March 7th.—For the supply of ironfounders' work, tools, ironmongery, forage, granite, granite siftings, broken chalk, brown pit flints, crushed shells, Thames ballast, gravel, granite kerb, channel and setts, York kerb and flagging, Portland cement and grey lime, artificial stone paving, harness and stable requisites, tar, tarred macadam (granite, slag, or limestone), wood blocks, oils and paints, for the corporation.—Mr. J. H. Brierley, borough surveyor, Town Hall, Richmond, Surrey.

EAST HAM.—March 9th.—For the supply of glazed stoneware pipes, glazed stoneware gully fittings (London make), stock and other bricks, Thames ballast, sand, coal and coke, broken granite, crushed granite, granite setts, Guernsey and other granite chippings, granite kerb and channelling, broken flints, cast-iron work, gullies, shovels, brooms, picks and handles, disinfectants, oilskins, hire of horses and carts, cartage of lime, uniforms, sewer ventilating columns, boots, sewer smocks, veterinary attendance, provender, reglazing and repair of street lamps, creosoted deal wood blocks, removal of timware from destructor works, and redressing of setts, for the corporation.—Mr. C. Eustace Wilson, town clerk, Town Hall, East Ham, E.

BUXTON.—March 10th.—For the supply of paving setts, flags, kerbs, Derbyshire basalt, macadam, tarred limestone, chippings and lump lime, Portland cement, earthenware pipes, disinfectants, castings (street ironwork), shovels, picks, ironmongery, brooms, brushes, pitch and refined tar, for the corporation.—Mr. F. Langley, borough engineer, Town Hall, Buxton.

DURHAM.—March 10th.—For the supply of broken whinstone, broken limestone, broken slag, rough slag, tarred slag, tarred limestone, distilled and prepared tar, tools, team labour and cartage, and sanitary pipes, for the county council.—Mr. Albert E. Brookes, county surveyor, Shire Hall, Durham.

DERBY.—March 12th.—For the supply of bricks, cement, lime, disinfectants, earthenware, freestone, gritstone, granite, gravel, sand, limestone, pitch, tar and slag, for the corporation.—Mr. John Ward, borough surveyor, Babington-lane, Derby.

LEEK.—March 12th.—For the supply of flags, kerbs, channels, setts, macadam stone and chippings, limestone and slag tar-macadam, Portland cement, sanitary pipes, pitch and oil, scavengers' bass brooms, cast-iron manhole and lamphole covers, galvanised malleable manhole step-irons, and cast-iron gullies and frames, for the urban district council.—Mr. W. E. Beacham, engineer and surveyor, Town Hall, Leek.

OLDHAM.—March 14th.—For the supply of granite setts, Rawtenstall setts, gritstone setts, Rawtenstall flags and kerbs, granite macadam, Portland cement, earthenware pipes, junctions and bends, cast-iron manhole and lamphole covers, gully grates, pitch and creosote oil, sand and gravel, timber, spades and shovels, for the corporation.—Borough Surveyor, Town Hall.

DARLINGTON.—March 15th.—For the supply of whinstone, limestone, slag, cement, lime, iron and steel ware, castings, brooms, brushes, disinfectants, oils, paints and refined tar.—The Borough Surveyor and Water Engineer, Town Hall.

BOURNEMOUTH.—March 15th—26th.—For the supply of road and sanitary materials, for the corporation.—Mr. F. P. Dolamore, borough surveyor, and the town clerk.

HEYWOOD.—March 17th.—For the supply of setts, kerbs (local stone), flags (local stone), earthenware pipes, bends, junctions, taper pipes, traps, gullies, pitch, creosote oil, limestone chippings (white), hand-broken granite and granite chippings, and Portland cement (British standard specification), for the corporation.—Mr. J. B. Nuttall, borough surveyor, Municipal Offices, Heywood.

SUTTON COLDFIELD.—March 19th.—For the supply of granite macadam, limestone, gravel and broken pebble stones, Yorkshire kerb, Rowley setts, earthenware pipes, cement and lime, iron castings, iron and steel, timber, hardware, oils and paints, and bass brooms, for the corporation.—Mr. W. A. H. Clarry, borough engineer and surveyor, Council House, Sutton Coldfield.

COVENTRY.—March 19th.—For the supply of broken roadstone, broken slag, granite kerbs, granite setts, stoneware pipes, castings and workmen's tools, for the corporation.—Mr. J. E. Swindlehurst, city engineer and surveyor, Council House, Coventry.

Miscellaneous.

BATTERSEA.—March 5th.—For the supply of good, strong, well-conditioned cart horses, from the 31st March next, the council to stable, shoe, and keep the horses, for the borough council.—Mr. W. Marcus Wilkins, town clerk, Town Hall, Battersea, S.W.

TEDDINGTON.—March 6th.—For the supply and planting of privet, Austrian pines, acacias, chestnut and other trees at the sewage disposal works, for the urban district council.—Mr. Marshall Hainsworth, surveyor, Public Offices, Teddington.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

* Accepted. † Recommended for acceptance.

ADWICK-LE-STREET.—For scavenging and emptying privy middens, for the urban district council.—Mr. G. Gledhill, surveyor :—

G. G. Buckley, Carcroft, Doncaster, £975, plus 15 per cent during the war and one month after.

BEXHILL.—For the supply of distilled tar, Tarvia, or other compounds for use in tar-spraying, for the corporation.—Mr. T. E. Rogers, town clerk :—

	Per gallon.
Bristowe & Co., Limited, London, S.W.	5½d.
R. S. Clare & Co., Limited, Liverpool ..	4 7/16d
Gas Light and Coke Company, London, E.C. .	4·2d.
Manchester and Sheffield Tar Works Company, Sheffield .. .	3½d.
Rylance & Sons, Liverpool ..	2½d.
Grindley & Co., Limited, London, E.	5¾d.
Road Supply Company, London, S.W. ..	3 11 16d.
F. G. Holmes & Co., Northfleet	3¾d.
Forbes, Abbott & Lennard, Limited, Shoreham	3¾d.

SOUTHAM.—Accepted for the supply of about 3,000 tons of granite and 250 tons of best blue broken slag, for the rural district council.—Mr. H. Pickering, surveyor :—

2½-in. Granite.—Midland Quarry Company, Limited Nuneaton, 11s. 2d. to 13s. 8d. per ton; Judkins, Limited, Nuneaton, 11s. 2d. to 13s. 8d. per ton; C. Abell, Limited, Atherstone, 11s. 2d. to 13s. 8d. per ton.

2½-in. Slag.—J. Freakley & Co., Limited, Tipton, 6s. 9d. to 8s. 3d. per ton.

FORTHCOMING MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

MARCH.

3.—Institution of Municipal Engineers: Annual Meeting of Northern District, Newcastle-on-Tyne.

5.—Society of Engineers: Mr. A. W. C. Shelf on "High Tensile Steel *versus* Mild Steel for Reinforced Concrete." Burlington House, W., 5.30 p.m.

23.—Town Planning Institute: Mr. W. Rees Jeffreys on "Road Construction and Improvements by Means of Town Planning Schemes." 6 p.m.

31.—Institution of Municipal and County Engineers: North-Eastern District Meeting at Spenborough.

APRIL.

7.—Institution of Municipal and County Engineers: Eastern Sub-District (Suffolk Norfolk, and Cambridge) Meeting at Beccles

APPOINTMENTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

THE CORPORATION OF BOLTON.
WATERWORKS DEPARTMENT.

Engineering Draughtsman wanted at once.

Must be ineligible for military service.

Apply, stating age, experience, salary required, and enclosing copies of recent testimonials—

LEWIS MITCHELL,
Waterworks Engineer.

Town Hall,
Bolton.
February 28, 1917. (3,340)

WANTED, at once, competent Engineering Assistant, conversant with Sewerage, Sewage Disposal, and Water Supplies. Apply, stating age, experience, salary required, and giving references, Willcox & Raikes, 63 Temple-row, Birmingham (3,331)

APPLICATIONS are invited for the Post of Municipal Engineer to the Municipality of Lahore, India.

The engagement to be for a period of five years on a monthly salary of Rs.1,250 (equivalent to £s.1,000 per annum) to Rs.2,000 (equivalent to £s.1,600 per annum), according to qualifications.

Applicants must have thorough experience of civil engineering, particularly of sewerage and water-works, as well as mechanical engineering, and should hold a diploma of some well-known college of engineering, and must not be under 30 or over 45 years of age.

Applications, which should be accompanied with certificates and references, and a full statement of experience and qualifications, should be sent, under registered cover, to the undersigned, to reach not later than 1st May, 1917.

A candidate selected in England will be given a first-class passage to Bombay and a first-class railway fare to Lahore.

(Signed) H. P. TOLLINGTON.
Deputy Commissioner and President.

... Municipal Committee,
... Lahore
... (3,335)

WANTED, Surveyor's Junior Assistant. Must have had Municipal experience. Salary £75 per annum. Apply, John ... and S. Crawshaw, Surveyor, Council Offices, Wednesbury, Staffs. (3,341)

TENDERS WANTED.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

BOROUGH OF SUTTON-COLDFIELD.
ANNUAL CONTRACTS.

The Corporation are prepared to receive Tenders for the Supply of the following Materials during the year ending March 31st, 1918:—

1. Granite Macadam.
2. Limestone.
3. Gravel and Broken Pebble Stones.
4. Yorkshire Kerb.
5. Rowley Setts.
6. Earthenware Pipes.
7. Cement and Lime.
8. Iron Castings.
9. Iron and Steel.
10. Timber.
11. Hardware.
12. Oils and Paints (in small quantities only).
13. Bass Brooms.

Conditions of Contract and Forms of Tender may be obtained on application to the undersigned.

Sealed Tenders, on the Forms supplied, and endorsed "Tender for Materials," to be sent in to me not later than Monday, March 19th, 1917.

The Corporation do not bind themselves to accept the lowest or any Tender.

W. A. H. CLARRY,
Borough Engineer and Surveyor.

The Council House,
Sutton Coldfield.
March, 1917. (3,339)

ELY RURAL DISTRICT COUNCIL.
TO GRANITE AND GRAVEL MERCHANTS.

The Ely Rural District Council, at their meeting on the 22nd of March next, will be prepared to consider Tenders for 2,700 tons of Granite and 1,050 tons of Gravel. Forms of Tender may be had on application to Mr. F. W. Firby, District Surveyor, Sutton, Isle of Ely. Sealed Tenders, endorsed "Tender for Road Material," to be delivered to me on or before Wednesday, the 21st March next; but the Rural District Council do not pledge themselves to accept the lowest or any Tender.

Samples must be sent to the Workhouse, Ely.

By order,
E. B. CLAXTON,
Clerk.

Local Government Offices,
Ely.
February 27, 1917. (3,338)

EAST HAM CORPORATION.
ANNUAL SUPPLIES.

The East Ham Corporation invite Tenders for the after-mentioned Supplies and for executing the following Work, for—

(1) A period of 6 months, ending 30th September, 1917, and alternatively,
(2) A period of 12 months, ending 31st March, 1918:—

Glazed Stoneware Pipes.
Glazed Stoneware Gully Fittings (London Make).
Portland Cement.
Grey Stone, Chalk, and Blue Lias Lime.
Stock and other Bricks, &c.
Thames Ballast, Sand, &c.
Coal and Coke.
Broken Granite.
Crushed Granite.
Granite Setts.
Guernsey and other Granite Chippings.
Granite Kerb and Channelling.
Broken Flints.
Cast-iron Work, Gullies, &c.
Shovels, Brooms, Picks and Handles.
Disinfectants.
Oilskins.
Hire of Horses and Carts for Watering Streets.
Hire of Horses and Carts for General Cartages.
Hire of Horses and Carts for Scavenging.
Hire of Horses and Carts for Collection of House Refuse.
Cartage of Lime.
Uniforms for Firemen, &c.
Uniforms for ... Tramway Employees.
Sewer Ventilating ... Columns.
Boots, Sewer Smocks, W... &c.
Veterinary Attendance ... and Shoeing Horses.
Provender. ... 22nd.
Reglazing and Repair of ... yeet Lamps.
Creosoted Deal Wood Blocks. ...el.
Removal of Tinware from Destruc... Untor Works.
Redressing of Setts (Labour only).

Particulars and Forms of Tender may be obtained upon application at the Offices of the under... signed, or by forwarding an addressed envelope (foolsca... For... size), duly stamped.

The person or persons whose Tender is accep... Ac... ted will be required to observe and fulfil the obligation... upon Contractors specified in the Fair Wages Resolution adopted by the House of Commons on the 10th March, 1909, which is fully set forth in the Form of Tender, and to enter into a Contract with a Bond for the due performance thereof.

Tenders to be delivered addressed to His Worship the Mayor, Town Hall, East Ham, E., and endorsed according to the supply or work tendered for, not later than 12 o'clock noon of Friday, 9th March, 1917.

The Corporation does not bind itself to accept the lowest or any Tender.

(By order)
C. EUSTACE WILSON,
Town Clerk.

Town Hall,
East Ham, E.
February 21, 1917. (3,320)

CITY OF COVENTRY.
WATERWORKS STORES (CAST-IRON PIPES, LEAD PIPES, SOLDER, &c.).

The Waterworks and Fire Brigade Committee of the Corporation of the City of Coventry invite Tenders for the supply and delivery of Cast Iron Pipes, Lead Pipes, Solder, Hydrant and Valve Boxes, &c., for the year ending 31st March, 1918.

Form of Tender and full particulars may be obtained, and samples inspected, on application to the undersigned.

Tenders are to be delivered at the Water Engineer's Office, Council House, Coventry, on or before Monday, 12th March, 1917, sealed and endorsed "Tender for Waterworks Stores."

The lowest or any Tender will not necessarily be accepted, and no Tender will be considered which is not made out on the form supplied.

J. E. SWINDLEHURST,
Water Engineer.

Council House,
21st February, 1917. (3,329)

The Surveyor

And Municipal and County Engineer.

Vol. LI. MARCH 9, 1917. No. 1,312.

Minutes of Proceedings.

Summer Time. The recently issued report of the committee appointed by the Home Secretary to enquire into the social and economic results of the Summer Time Act, 1916, shows that upon the whole of the evidence received the vast preponderance of opinion throughout Great Britain is enthusiastically in favour of the scheme and of its renewal not only as a war measure, but as a permanent institution. As a result of their investigations, the committee therefore recommend that Summer Time should be reintroduced this year and in subsequent years. The enquiry conducted by the committee was of a comprehensive nature, and included the taking of evidence from most if not all of the interests affected. Two sections of the general summary of the evidence contained in the report are of special interest to our readers. We refer to those which deal respectively with public health and with economics in artificial light and fuel. With regard to public health, the conclusion, although satisfactory as far as it goes, is not very convincing. The abnormal conditions which prevailed last summer in themselves prevented any very definite evidence being offered as to the effects of the Act on the public health. Such evidence as the committee were able to collect, however, shows that, so far as the conditions permitted, the extra hour of daylight was generally used for the purpose of outdoor recreation and pursuits, and in particular for the cultivation of gardens and allotments. This being so, it is evident that during the present crisis in regard to food production the adoption of the Summer Time scheme this year is highly desirable. Apart from this, the general medical opinion, as communicated to the committee, is that the extra hour in the open air must have proved beneficial to the health of those who enjoyed it, although at the moment no particular facts and figures can be adduced in support of this statement. With regard to economies in artificial light and fuel, the committee were again unable to obtain such definite evidence as might have been available in the absence of other disturbing factors. The general result, however, appears to be that, as regards electric light, there was a reduction in consumption of something like 20 per cent for lighting purposes, while in regard to gas the reduction works out at about 9 per cent, so far as it can be estimated at all. The information, it is true, is not very precise, but it at least leads to the conclusion that the adoption of the principle of Summer Time last year resulted in a considerable saving in the national coal consumption. We need hardly say that for ourselves we cordially endorse the recommendation of the committee for the reintroduction of the measure.

* * *

Economy in Water Treatment. Every economy which is the result of careful thought and scientific work, as distinguished from wasteful systems or precedent, is welcome, and is, moreover, exactly what is wanted at the present time. It is therefore useful and interesting to hear of the substitution of iron for alluminium sulphate at the filtration plant at Clarksburg, Western Vancouver, waterworks, this having greatly reduced the war-time cost of coagulant. Mr. Perkins Boynton, the chemist in charge of the waterworks, has recently published a very interesting description of this process. The altered treatment is due to the greatly increased price of sulphate of alumina, which led to the trial of sulphate of iron and lime. The conclusions drawn from the first trial were that a clear, sparkling water could be obtained at all times with original turbidities varying from 10 to 1,500 parts, and later results obtained during six months' working have borne out the conclusion. Also the comparative costs of the two coagulants—viz., iron, including the use of lime all the time, and alum, using lime when necessary—were 85 and 813 per 1,000,000 gallons. Thus a great saving was effected. It should be noted, however, that the result of the constant application of lime has been that a greater quantity of hypochlorite is required in order to kill the bacillus coli in the filtered water, the quantity of hypochlorite of lime being increased from 5 lb. or 6 lb. to 8 lb. or 10 lb. per 1,000,000 gallons. It should be remembered that the cost of hypochlorite of lime has advanced considerably. The result is in agreement with the theory that a longer time is necessary for a given quantity of hypochlorite to act on a water free from carbonic acid gas than on one in which carbonic acid gas is present. The advanced prices of materials, and the various altered conditions produced by the war, eventually produce great increase of working costs, and when this occurs it is obviously necessary that the best scientific attention should be directed to the problem, and it will more often than not be found that an intelligent change of methods will produce economical results. Such troubles should be a spur to ingenuity, and if dealt with properly will lead to valuable discoveries and to the adoption of methods which will be of the greatest value long after the war conditions have passed away.

Water Waste. Apropos of the subject just referred to, the discussion of water losses in city systems at a recent meeting of the New England Waterworks Association suggests that greater attention might be given to the matter. The casual way in which American engineers refer to leakages and waste is a matter for surprise to the English water engineer, for there are very many places in this country where great attention is given to economy of fuel at the pumping station, and where the leaking condition of the mains and house services is practically ignored. It is said that about 50 per cent. of the water supplied to the population of the United States by the water authorities is wasted, and the cost of this water is estimated at over £5,000,000 per annum. If a similar calculation were made for this country the result would be interesting. When it is remembered that in a great many cases this waste water must be pumped up as sewage, the cost of waste and leakage—for leakage is apt to find its way into sewers—is clearly no small matter. The fact that house service pipes have not an unlimited life is completely overlooked. Iron pipe services over a certain age ought to be relaid. Even in London a house cistern may overflow for months or years, and a service pipe, or a series of service pipes, may leak for an indefinite time without discovery and without proper steps being taken for discovery. Means are at hand for checking such leakages, and the contention that mains cannot be made tight is inadmissible. The value of work done in producing a watertight system and in maintaining it is not yet properly recognised.

Linking-up Electricity Undertakings. Not before it was needed steps are being taken officially to encourage the linking-up of municipal electricity undertakings in the country. Steps have already been taken voluntarily in certain London boroughs to attain this end, with results that have yet to be recorded, but there is little doubt that with proper management these will in the end be satisfactory. Now we have to welcome the intervention of the Board of Trade in the matter, and, though this intervention would seem to be more moral than actual, it has been received with acceptance by a large number of municipal authorities in the Midlands. Mr. G. H. Roberts, M.P., Parliamentary Secretary to the Board, took the chair last week at a conference held at Manchester of delegates from the municipal electrical undertakings in Lancashire and Cheshire with a view to setting in motion a scheme for linking-up the various works. The proposal, he explained, was a war-time measure, and economy with the generating of the industrial supply of electricity was the essence of the scheme. That it should require a war-time crisis to bring home to our minds the necessity for what ought to be an every-day desideratum is characteristic of many phases of our commercialism. This point need not be laboured now, however. What really matters is that evidence was forthcoming of the substantial benefits to be derived from the proposals made. The electrical engineer of the Manchester Corporation, Mr. S. L. Pearce, showed from a report prepared by a committee of which he is chairman that with coal at 17s. 6d. per ton there would be an annual saving on coal alone in respect of four groups of £82,000 a year, and that figure could be materially increased. The scheme of which a general outline was given, received the formal approval of the delegates, and the details, including the setting up of a joint board, will be arranged in conference with the municipal undertakings and the Board of Trade. It aims at the removal of that enormous waste of labour and material which was so general before the war by means of a system of co-operation and co-ordination which it is to be hoped may become universal in our industrial life before long.

* * *

A Proposed Wheel Tax. Traffic arising directly, or indirectly, out of the war has caused such a strain upon the roads of the country, and the shortage of labour has rendered it so difficult to maintain them in a state of efficiency, that it is evident that at the end of the war some drastic steps will have to be taken to prevent their ruin. This will, of course, involve the raising, in one way or another, of a vast sum of money. The matter has been under consideration by the Association of British Motor and Allied Manufacturers, Limited, and they have put forward a number of proposals on the subject. They do not favour any heavy taxation of road users, either by means of a petrol tax, licence duties, or other methods. Their contention is that taxes of this kind not only tell against the market interests of the motor industry, but by penalising transport handicap all industry and prosperity. We cannot at the moment go into the merits of this argument, and we merely repeat it because it leads to a proposal which cannot but be of interest to our readers. This proposal is no other than that a wheel tax should be imposed on all road users in respect, not only of motor vehicles, but also those that are horse-drawn. It is suggested that the tax might be fairly graduated according to the weight of the vehicle and its motive power. Again, it is proposed that the proceeds of tax should not be treated as principal money for immediate expenditure, but that it should be used in the payment of interest on a road loan of £20,000,000 or £30,000,000. When it is suggested, however, that the loans should be used for the purpose of remaking roads for motor transport, it is at once seen that the imposition of the suggested tax would be strenuously opposed by the users of horse-drawn vehicles, who would in effect be called upon to pay a substantial contribution towards the cost of work which would be admittedly undertaken for the exclusive benefit of motor traffic. The proposal as set forward, however, is of so bold and novel a character that we shall be interested to learn the views on the subject of the proposed tax of those who look at the question, not from the point of view of road users, but rather as highway engineers.

* * *

National Service. Although Mr. Neville Chamberlain's scheme for National Service is making good headway, it appears from the speeches that he is making that a good deal more remains to be done before he will be satisfied with the result. Some doubt has been expressed in certain quarters as to whether it is desirable for those who are already doing work of national importance to enrol themselves as National Service volunteers. To this question Mr. Chamberlain returns an affirmative answer, and in our opinion rightly so. The principal value of a Director-General of National Service is to act as a judge as to whether individuals are or are not doing the best work possible in the public interest in present occupations. But unless everybody enrols as a National Service volunteer, no matter what work they may be doing now, the decision as to whether their present work is of national importance or not will be removed from the Director-General to the individual. The question is one which directly affects the officials of local authorities, and a circular on the subject has just been issued by the Local Government Board. This circular points out that officials ought to enrol as volunteers, and gives an assurance that they will not be called up for service without an opportunity being given to appeal against their removal on

the ground that they are already doing work of national importance. The result is that the fact of the officials of a local authority being enrolled will not entail any disturbance of the work of the authority unless it should be in the national interest to transfer individuals elsewhere, and in such cases the authority would be consulted, and in the exceptional circumstances would probably give their consent. The duty of local authorities and of officials under the scheme is therefore clear, and we are confident that as good a response to the appeal that has been made will be forthcoming from local government officials as from any other class of the community.

* * *

Refuse Removal in St. Pancras.

Many local authorities have experienced difficulty in providing adequately for the service of the removal of house refuse, in view of the taking of labour for military service. Happily, however, in few districts has the trouble become so acute as it has in St. Pancras. In that borough the service has been most seriously crippled, principally owing to the fact that stokers have been taken by the Army authorities from the refuse destructor, and that it has, of course, been found impossible to replace them by women, owing to the strenuous nature of their duties. Every effort has been made to replace these men, but the result has only been to secure fifteen instead of a normal staff of twenty-seven, which means that the destructor has been able to burn only about 70 tons a day instead of the normal minimum of 150 tons. Unfortunately, there is in St. Pancras no storage place for the refuse, although it has been suggested that it might be placed in the public gardens. This course, however, has quite rightly not been adopted, and if it had there must have been serious danger to the public health. It now appears that the difficulty has partly been overcome by an arrangement made with the Midland Railway Company to remove the refuse for deposit to a large open space at Gospel Oak under conditions which will not be at all deleterious to the immediate neighbourhood. We understand that in securing this accommodation the borough council have received considerable assistance from the Local Government Board, and it is at least encouraging to find that that department is alive to the importance of taking every possible step to maintain in a state of efficiency the public health service of the country.

* * *

An Important Appeal.

On Monday last judgment was given in the Court of Appeal in the case of the *Metropolitan Water Board* v. *Dick, Kerr & Co., Limited*. The appeal was from a judgment of Mr. Justice Bray, which has already been noted in these columns. We may, however, remind our readers that the action arose out of a contract to construct two reservoirs at Littleton, Middlesex, which the defendants had agreed to construct for £673,000. The substantial question in the case arose out of the action of the Ministry of Munitions, who, in exercise of their powers under the Defence of the Realm Act and Regulations, had required the defendants forthwith to cease work on the contract. The defendants contended that, by reason of this action of the Ministry, the further performance by them of their part of the contract had become impossible and illegal, and that in consequence the contract was at an end. Mr. Justice Bray held that on the true construction of the contract the intention of the parties was to enable the plaintiff's engineer to extend the time for performance to every possible event which might delay the completion of the contract, including the intervention of the Ministry of Munitions, and that the contract had not in fact been frustrated or its completion rendered physically impossible or commercially impracticable. In the Court of Appeal, however, this decision was overruled, and it was held that in the events that had happened the contract was dissolved, and the court made a declaration to that effect and discharged the injunction which had been granted by Mr. Justice Bray restraining the defendants from removing the plant remaining on the site.

* * *

Contracts During the War.

There are probably few, if any, local authorities that have not had appeals made to them by contractors for a revision of the terms of contracts owing to hardship created by the prevalent war conditions. Pleas of this kind from contractors have placed local authorities and officials in a rather difficult position, for whereas, on the one hand, they have realised the hardship of holding contractors to their bargains, they have, on the other hand, felt difficulty in releasing them because of a realisation that they are dealing practically as trustees with the money of the ratepayers. The introduction into the House of Commons of a Bill to meet this difficulty will therefore be received with some relief. We refer to the new Courts Emergency Powers Bill, which was recently introduced by the Solicitor-General. The first part of the Bill deals with contracts and particularly with the legal position of contractors, who before the war entered into contracts for the construction of buildings and found that, by reason of circumstances attributable to the war, it was impossible for them, without serious hardship, to perform their contracts within the stipulated time. In circumstances like these the Bill proposes to empower the court in proper cases either to suspend or annul the contract, provided that the court is satisfied that the performance of the contract is prevented or rendered gravely onerous by difficulties due to the war, either in regard to labour or materials. The Bill has been read a second time, and the principle having thus been accepted, no doubt it will become an Act in due course.

* * *

Restricted Lighting and Street Accidents.

In the comments which we made upon the inauguration of what has come to be known as the "Safety First" Campaign, we ventured to express the opinion that the great increase in the number of street accidents in the Metropolis was not attributable to the restricted lighting of the streets so much as to excessive speed and careless driving of motor vehicles. This view is borne out by the answer which was given by the Home Secretary to a question recently asked in the House of Commons as to the possibility of increasing street lighting in order to avoid accidents. Sir George Cave then stated that he could not agree that the increase in the number of fatal accidents was wholly or mainly due to the darkening of the streets, and in answer to a supplementary question he suggested that it might be due to the lack of experience of drivers and to too rapid driving. The attempt to attribute the increase chiefly to reduced lighting can hardly be justified in view of the ascertained fact that the number of accidents during daylight has increased almost in exactly the same proportion as the number during the hours of darkness. It is nevertheless satisfactory to know, as the Home Secretary stated, that the subject of street lighting has been considered in consultation with the military authorities and representatives of local authorities, and that, as a result, some modification may be looked for in the obscuring of public lamps, thereby ensuring some improvement in the diffusion of light in the streets.

Brushwood as a Medium for Sewage Filters.

[In an interesting article in the "Canadian Engineer," of Toronto, Mr. George Phelps, A.M.CAN.SOC.C.E., engineer in charge of the North Toronto Sewers and Disposal Works, gives the results obtained from experiments with brushwood and slag as filter media. The brushwood filter described, which is stated to have been a decided success, is virtually the outcome of the experiments with the lath filter originated by Lieut.-Colonel G. G. Nasmith, C.M.G., Director of Laboratories, Department of Public Health, Toronto, of which an account was given in "The Surveyor" of January 5th last.]

The sewage of North Toronto is treated in disposal works constructed prior to the amalgamation of that district with the city of Toronto; it is a domestic sewage, with practically no trade wastes, roof water being admitted to the sewers, but no other surface drainage.

In the early part of 1914 it was found necessary to clean out and refill some of the filters, and as an experiment it was decided to use brushwood as a medium in one case, and for a second filter, screened, washed and graded slag, so that the two could be run under similar conditions and a fair comparison made between the results obtained. The depth of the medium in each case was 5 ft. 6 in., both filters being 50 ft. in diameter, and roofed over. The distributors are of the Adams rotary type. Before reaching the filters, the sewage passes through a coarse screen, detritus tanks and sedimentation tanks, the retention period in the tanks averaging about three hours.

The brushwood filter was started on June 3, 1914, at an average rate of flow of two million gallons per acre per day, and has been run continuously at varying rates up to the present time, with only a few short stoppages for alterations to the plant, the longest stop being for three days. There is a continuous and fairly constant flow to the filter, the maximum and minimum rate for any day being about 10 per cent above and below the average.

After two months' working, the brushwood had become thickly coated with grey slime, and a very satisfactory effluent was obtained, and from that time on the flow to the filter has been periodically increased up to the present average rate of 7,250,000 gallons per acre per day.

The sewage passes through the filter at the present rate as freely as when it was first started. The coating of slime on the brushwood is in a condition of stability where it appears neither to increase nor diminish, and, as there is no sign of clogging, Mr. Phelps thinks it probable that the flow may yet be somewhat increased. The most noticeable change which took place was the shrinking of the brushwood, which in a few months settled down until the depth of medium was only about 4 ft. 6 in. This shrinking apparently stopped after about 18 months' working, and the brushwood shows no signs as yet of rotting or breaking down.

The slag filter, which has been kept under observation alongside the brushwood, is filled with washed and screened steel slag, graded as follows:—Bottom, 1 ft. of 3-in. to 5-in. slag; middle, 3 ft. of 1½-in. to 3-in. slag; top, 1 ft. 6 in. of ¾-in. to 1¼-in. slag.

It was started at a rate of 1½ million gallons per acre per day, and worked up to 2½ millions in six months; the rate was increased for a short time to three millions, but this resulted in clogging and ponding on the surface, and the rate had consequently to be reduced. The effluent from this filter has always been satisfactory, but its capacity is limited to about two million gallons per acre per day, the rate at which the sewage will pass through without clogging.

The effluent from both filters contains usually from 1 to 2 cubic centimetre of sediment per litre; this is a fine humus which is settled out by a half-hour retention in tanks; it is liable to increase with sudden rushes of storm water, but is easily got rid of.

Samples of sewage and effluents have been taken regularly five days in the week, until three months ago, since when samples have been taken on only two days in the week. These are always taken between 10 a.m. and 12 noon about the time of maximum flow. Analyses are made in the laboratory of the Medical Health Department of the city, and the following tables give the average results obtained, viz.:—

January to December, 1915.

	Free Amm.	Alb. amm.	Putrescibility.	Nitrates.
Tank effluent ...	12·83	2·83	22	—
Brush filter effluent ...	19·79	1·82	95·7	—
Slag filter effluent ...	14·1	1·69	96·4	—

December, 1915, to May, 1916.

	Free Amm.	Alb. amm.	Putrescibility.	Nitrates.
Raw sewage ...	12·50	3·84	—	2·36
Tank effluent ...	11·45	3·06	32	2·50
Brush filter effluent ...	10·59	1·56	90	2·55
Slag filter element ...	5·37	1·51	98	6·00

May to November, 1916.

	Free amm.	Alb. amm.	Putrescibility.	Nitrates.
Raw sewage ...	27·6	7·92	—	—
Tank effluent ...	22·3	3·94	35	—
Brush filter effluent ...	16·9	2·41	99·7	—
Slag filter effluent ...	11·4	2·20	100	—

The methylene blue test is used for putrescibility, and value 100 equals stability for 10 days.

The filter effluents are settled for one half-hour before analysis.

"Although the sewage," says Mr. Phelps, "is getting stronger in character, as shown by the average results for the last six-monthly period, the effluent from the brushwood filter is more stable than it previously has been, and the rate of flow at the same time is greater. This seems to indicate that the filter has not yet reached the limit of its capacity. The only tests for nitrates were taken during March and April, 1916. The average results given in the table go to show that nitrates are not formed in the brushwood as readily as in the slag filter, which is no doubt due to the rapidity with which the sewage passes through the brushwood. Unfortunately, this period included the time of the spring thaw, and the sewage was very much diluted. The filter was also taking considerably over 7,000,000 gallons per acre per day for practically the whole of the two months, so that further tests are necessary before a definite opinion can be formed on this point."

Mr. Phelps proceeds to describe the method of making and placing the brushwood mattresses in the filter. The floor of the filter is formed with a slope each way to the underdrains. The brushwood is placed in the filter in the form of mattresses of two cubic yards each. These were made by filling the brush into a wooden box of the required shape, and pressing it down with a follower on a long lever. The mattresses were wired up whilst under a pressure of about 80 lb. per square foot, and after this was released the shape was retained and they were easily handled. Witch hazel was found to be the best material for making up, but Mr. Phelps states that almost any kind of brush is suitable, provided no dead wood is used. It requires to be cut in the autumn or early spring, when no leaves are on. The cost of cutting, bundling, hauling about half a mile and placing the brushwood in the filter was much below that for which any ordinary medium could be obtained.

The results have been so satisfactory that brushwood as a medium is being used generally at the North Toronto plants when any filter needs refilling. The open nature of the brush, the writer of the article points out, allows good aëration, and it is very efficient when working at a high rate of flow. The rotary distributor also seems well adapted for this type of filter. It gives a good distribution, does not require a great deal of attention, and requires only about a foot of head for its operation.

"For small installations," Mr. Phelps continues, "particularly where operating charges are of great importance, it may be a long time before the activated sludge process, with the introduction of power that it entails, can compare favourably in cost of construction and maintenance with a plant consisting of sedimentation tanks and brushwood filters. Furthermore, an examination of the two processes will show that they are not so different in principle as at first sight they appear to be.

"The activated sludge process by the mechanical aëration of sewage induces the growth of organisms on particles of sludge, and by a mixing process brings these sludge particles into contact with all parts of the sewage, so accomplishing the process of oxidation and nitrification. The percolating filter accomplishes the same purpose by the reverse process, the organisms being stationary on the medium of the filter,

and the sewage brought into contact by trickling over the gelatinous substance in which they are contained.

"Most recent methods of sewage disposal show that the three main conditions necessary for the effective purification of sewage are: Sufficient aëration, a suitable medium for the growth of nitrifying organisms, which must be brought into intimate contact with all parts of the sewage, and the maintenance of the sewage at a moderate temperature. In the activated sludge process the introduction of the necessary power and machinery for air compressing adds very much to the operating costs, and any process which would automatically maintain the required conditions would naturally recommend itself, provided that the results were satisfactory. The above experiment has shown that the brushwood filter maintains fairly well the conditions set out above, without the introduction of power. Constructed with a good system of underdrains and with a space between the walls of the filter and the brushwood mattresses, the air has very free circulation throughout. The brushwood does not get compacted or lose its spring, but keeps quite open, and given proper ventilation, with the falling of a large volume of sewage through the filter, the air contained is constantly being changed.

"Brushwood also shows itself to be particularly suitable as a medium for inducing the slimy growth characteristic of sewage filters. The thick coating of this slime over every particle of the brush is in marked contrast to anything that can be seen on a medium such as stone or slag. Regarding temperature, it should be noted that the sewage at the experimental plant does not fall below 40 deg. Fahr. in the winter, and rises to a maximum of 58 deg. Fahr. in the summer; and, as the tanks and filters are all covered, the effluent leaves the plant at about the same temperature as the sewage enters. The temperature of the air at 4 ft. above the surface of the filter is noted every day, and only occasionally in the coldest weather does it fall as low as 36 deg. Fahr. The temperature of the filter medium can be taken as that of the sewage itself—that is, usually ranging between 40 deg. and 50 deg. Fahr., a favourable working temperature which has probably an important bearing on the efficiency of the filter.

"To engineers constructing filters of this type it is recommended that they be made at least 7 ft. deep, if possible, and made up to this depth again when the bed has been in work for twelve or eighteen months, in which time it will have shrunk down considerably. Nothing has been added to the one described since it was started, not because it is inadvisable, but because it would break the continuity of the experiment. A deeper filter would give the sewage a longer time in contact with the medium, and should give better nitrification. A 7-ft. deep filter could probably be worked efficiently up to 8,000,000 or 9,000,000 gallons per acre per day."

Mr. Phelps is of the opinion that a brushwood filter would satisfactorily treat raw sewage after passing through a coarse screen and detritus tank, without a preliminary treatment in sedimentation tanks at something approaching the rate of working obtained in the above plant, provided that the effluent were passed through a suitable humus tank, and it is hoped to be able to continue the experiment along these lines. Such a filter, he remarks, might be constructed on a coarse grating over a two-storey tank having a deep sludge digestion chamber, free air space being allowed all round, under and above the filter, the sewage falling through the filter directly into the tank. After sewage has been aërated the suspended solids quickly settle out, and a retention period of one half-hour in the tank should be sufficient to give an effluent fairly free of suspended matter. The sludge and humus would be collected in the same digestion chamber, and might be drawn off under hydraulic head in the manner usual with two-storey tanks.

In a concluding note Mr. Phelps says: "The principle of treatment of sewage in sedimentation tanks followed by percolating filters has been criticised on the ground that during its passage through the sewers aerobic bacteria are developed in the sewage and the process which is started there is reversed in the sedimentation tanks, where anaërobic bacteria are developed, to be reversed again in passing through the filters, which is a distinctly aërobic process. The part played by aërobic bacteria in the sewers is open to question, but there is no doubt that the treatment of sewage by filtration after it has passed through sedimentation tanks is a change over from the anaërobic to the aerobic process. A method which would eliminate the first sedimentation tank as here suggested would not be open to this objection, and the removal of what is apparently a check in the process might help towards the attainment of good results."

OFFICIALS AND NATIONAL SERVICE.

CIRCULAR TO LOCAL AUTHORITIES.

The following circular has been addressed to the clerks of local authorities by the Secretary of the Local Government Board:—

"I am directed by the President of the Local Government Board to state that he has received a number of applications from local authorities enquiring whether their officials should enrol as volunteers under the National Service scheme. Lord Rhondda has been in communication with the Director-General of National Service on the subject, and he is assured by him that no volunteer will be called up for service without an opportunity being given to his employer to appeal against his removal on the ground that he is already doing work of national importance, and further that the fact of the officials of a local authority being enrolled will not entail any disturbance of the work of the authority unless it should be in the national interest to transfer individuals elsewhere, and that in such cases the authority will be consulted. The Director-General fully realises that the administrative work of local authorities, in particular that which is required for maintaining the public health and public assistance, must continue. In these circumstances Lord Rhondda hopes that every encouragement will be given to the employees of local authorities to fill up the forms of offers of service."

"CUTELINE."

Now that the meaning of a series of single-letter pages in recent issues is announced, our readers will be interested to learn something of what "Cuteline" really is.

This material is the result of long experience in the fight against water and general corrosion, and the success achieved by the inventor in respect to plastic cements had led him on to further discoveries.

Plastic Cements and Fibrastic, Limited, are well known for their quick-setting and non-setting plastic cements, both of which materials they claim absolutely resist water in their respective methods of application.

Experiments made in this direction revealed the fact that the general surface of the material used was preserved, but a plastic cement not being a convenient form of application for a general surface treatment, further trials were made, which resulted in the perfection of Cuteline.

The chief difference lies in the fact that whereas a plastic cement, whether quick-setting or non-setting, is generally wanted in a position where pressure is required, Cuteline is applied to the surface of any material, in any position, under any conditions, as a reliable preservative.

We have seen concrete tanks which before the Cuteline was applied would not hold water for more than a few hours, but when coated on the inside with Cuteline, water, paraffin, and acid solutions remain, and show no sign of percolation whatever after months of standing. The same thing applies to any other material used in the construction of buildings, &c., whether wood, iron, steel, concrete, brickwork or stone—Cuteline makes them thoroughly waterproof.

The uses to which Cuteline may be applied appear to us almost endless, and if our readers desire any further information, we cannot do better than refer them to Mr. James Robbins, of Plastic Cements and Fibrastic, Limited, who will be only too pleased to show them his product and results in his comfortable office, at 11, Tothill-street, Westminster, S.W.

After-War Works at Broadstairs. — Broadstairs Town Council has been asked by the Local Government Board to make a formal application for sanction to a loan for work which it wishes to put in hand on the termination of the war. The council proposes to drain a new area of the district at a probable cost of £50,000.

The Testing of Materials.*

By P. C. COWAN, D.SC., M.INST.C.E.

The application of regular tests to materials is of comparatively recent origin. In an excellent encyclopædia published in 1859 the only definition of tests is that they are substances used by chemists in analyses. Until less than a hundred years ago, materials and the structures composed of them by man were comparatively simple. Stone, bricks, timber, lime, wrought iron and a few other metals sufficed, though the valuable properties of alloys and the means of hardening iron were known to the ancients. The invention of the steam engine, however, with its great effects in facilitating mechanical operations and transport, and the discovery of methods for the production of steel in great quantities, changed the whole situation, and introduced a countless number of problems which require the careful testing of materials.

Actual experience, both of success and failure, gained in a long period of time, affords the best means of judging the qualities of a material or a structure; but we cannot always wait for such experience. Engineers are constantly called upon to apply new material to new needs, with the limiting conditions that there shall be no failure and no unnecessary expenditure. Hence arises the practical need for testing materials, so that the engineer may justly proportion the dimension of parts of machinery or structures.

Testing is, of course, also of the greatest importance to the manufacturer, as, by skilful observation of the results obtained from different proportions in a composite material, or from different treatment of the same ingredients, he is enabled to improve his results, and to supply materials specially fitted for their purpose at a minimum cost. Tests fairly applied are also of great importance to the merchant and to his customers. They ensure that honest value shall be given, and prevent unscrupulous undercutting of prices and adulteration.

TESTING LABORATORIES.

The great value of testing laboratories has been recognised for many years, but was first insisted upon with convincing effect in the British Islands by Prof. (now Sir Alexander) Kennedy, on whose advice such a laboratory was started at University College in 1878. Now many of our colleges have similar departments, in which students obtain the most valuable kind of training. Valuable research work is also done in them by professors and their advanced pupils. We can gain knowledge in various ways—by reading, and by listening to lectures, and by seeing things done; but best of all, by doing things ourselves. That which we read, or hear of, or even see, is much more likely to escape our memory than that which we have done.

I am glad to say that very good teaching and research work is carried on in the laboratories at Trinity College, Dublin, and in the Technical Institute, Belfast, which is now most happily linked to the Queen's University in that city. Good laboratory work is also being done in the University Colleges of Dublin, Cork, and Galway. A fine mechanical laboratory has been equipped in the Royal College of Science, Dublin, and will doubtless prove of great value, especially if, as is likely, close co-operation is secured between the College of Science and the new University College, Dublin.

The high esteem in which such work is held by those most competent to judge of its value is proved by the fact that Dr. Unwin, who has, with brilliant success, devoted many years of his life to the study and exposition of the properties of materials, was, a few years ago, president of the Institution of Civil Engineers, which is probably the most powerful learned society in the world.

The late Sir Benjamin Baker, who was an ideal engineer, said in 1887 it had often come under his notice that a man whose mathematical training and whose training in a workshop has been all that could be wished, had designed a structure which failed from an apparently insignificant oversight in some small detail, which would not have occurred had the designer acquired the habit in an engineering laboratory of looking upon every detail of the work as a possible test-piece, the strength of which must be determined by calculation and verified by experiment. A man might have fifty years' practical experience and be deficient in qualifications with which a year's work in an engineering laboratory would have endowed him. He had seen practical men contentedly wedging up a line of continuous girders at the piers to get them true to the eye, when an error of 1 in. in 100 ft. meant an increased stress of 8 tons per square inch. A student who had measured the reaction of model continuous girders would as soon have contemplated manslaughter. Dozens of failures occurred with pumping machinery because the experienced practical men who designed it had not a clear realisation of the consequences of momentum, fluid friction, and other points which were impressed upon students by laboratory experiments.

The true aim is to make the engineer practical from the foundation, and to stamp out the indolent habit of resting content with a speculation, when the absolute truth can be elicited by experiment. This habit was too characteristic of the last generation of engineers, and if things had greatly improved now, the good result was largely due to the establishment of engineering laboratories. Yet only in 1902, when the National Physical Laboratory was founded at Bushy Park, did the Government begin to aid scientific research. This institution has done much invaluable work for the Empire, though it has hitherto received comparatively trifling financial aid from the State. For the first five years it received a grant of £4,000 a year, and now receives about £17,000 a year, of which the greater part is for aeronautical research. The United States Government give the American Bureau of Standards about £100,000 a year.

ENGINEERING STANDARDS COMMITTEE'S WORK.

Very important work has been done during the last sixteen years by the British Engineering Standards Committee, which was formed in 1901 at the instance of Sir John Wolfe Barry, past-president of the Institution of Civil Engineers.

The committee has received moderate but substantial aid from the Home, Indian, and Australian Governments, and has been supported by the Institution of Civil Engineers, the Institution of Mechanical Engineers, the Institution of Naval Architects, the Institution of Electrical Engineers, and the Iron and Steel Institute. The committee was most fortunate in the election of Mr. Leslie S. Robertson, M.INST.C.E., as their secretary, and his loss in H.M.S. "Hampshire" was most widely and deeply regretted.

Nearly 100 reports have been issued specifying in a standard manner engineering materials and products, from locomotive engines for Indian railways to electrical cooking apparatus; from steel and iron for ships, railways, boilers, and motor cars to salt-glazed pipes, cement, coal, and road metal. To avoid stereotyping present practice and checking progress, the reports are revised from time to time, the need for such revision of each report being specially considered at least once a year. The expenses of the committee are largely met by subscriptions from manufacturing firms, railway companies, and public authorities, and from the sale of reports. It is most desirable that the price of these reports should be reduced, but that can only be done if additional contributions are secured. The way in which the reports of the committee are framed is satisfactory and practical. A sectional committee, including engineers, experts in connection with the special subject under consideration, and a number of the principal manufacturers concerned, is formed to deal with each report. This constitution of the committee is found to be very effective in preventing the adoption of extreme views regarding what is desirable from the engineer's point of view, or, on the contrary, what best suits the manufacturers, and secures in great measure satisfactory results both as to quality and cost.

The adoption of the British standard specifications is quite voluntary, but they are rapidly passing into very general use at home, in India, and in the Colonies, and will probably ere long form the basis for many foreign orders to our manufacturers, especially if the specifications are translated into the various principal languages, with the necessary conversion of measurements.

One of the most recent standard specifications prepared is for the sizes of broken stone and chippings, and it is adopted by the Road Board in relation to its grants for road improvements.

The immense importance of the standardisation of

* Extracts from presidential address to the Engineering and Scientific Association of Ireland.

methods and products is now widely known. The wonderfully low cost and high efficiency of the Ford motor cars and American and Swiss watches depend largely on standardisation of parts; and the vitally important speeding up of the Allies' supplies of munitions was only possible on account of the standardisation of parts and the adoption of a thorough system of gauging to secure the accurate finish of component parts.

—EURIPIDES.

THE CIVIC SURVEY OF S.E. LANCASHIRE.

To the Editor of THE SURVEYOR.

SIR,—Professor Abercrombie says that I am "frankly hostile to the Civic Survey, treat it unfairly, and endeavour to call up the evil passions of professional men by trying to put architects against surveyors"; but I do not admit that this view is correct, or comes with a very good grace from the Professor, judging by the tone of his letter in your last issue.

A civic survey carried out on right lines should be extremely useful in most cases, and it is only because it has not been carried out on right lines that this survey has met with any criticism. The hon. director of this survey is too experienced a journalist to expect to escape criticism, especially after inviting it, and I do not think he has shown his usual tact in questioning the somewhat mild criticism made in your annual issue.

The feeling between the two professions arises from the systematic attempt to belittle the municipal engineer which is made by the architectural press and profession, and because municipal engineers do not submit quietly to the alternate scoldings and patronage which they receive from architects, and resent the attempts to teach them the rudiments of their profession, they are accused of stirring up strife and evil passions. If architects would only remember the homely old saw about teaching one's grandmother how to extract the contents of eggs they would not butt in so often to teach surveyors how to lay out or make roads.

The Professor's defence of the traffic plan is neither ingenious nor ingenuous, and I cannot pretend to see the point of his reference to the encyclopædia and parish pump, or to understand his very mixed metaphor about the "elixir of the road problem." All that I know is that the plan set out to give a graphic representation of the traffic on the roads in the Manchester district, and that the data was so inadequate, and based on so short a time, that it was quite useless for the purpose for which it was intended. If the plan had given a full and correct record of the traffic on these roads, I can hardly imagine any surveyor foolish enough to carry out the Professor's suggestion of putting a fence down the middle of the road; but the suggestion of the gentleman who called attention to the lop-sided traffic shown on the plan, that it might be necessary to remove the tram rails from the centre of the road so as to accommodate the lop-sided traffic, was one that had much to recommend it.

The idea of traffic plans for large areas is, as I have said previously, admirable, and it was with the view of preparing such plans, and for the classification of the roads by the Road Board, that the census of traffic was undertaken in 1914 by our county and other local authorities. In the hands of men who understood their requirements such plans would have been found very useful, but when they passed into the hands of amateur road engineers and budding artists, they could not be expected to be found satisfactory. Professor Adshead is to be allowed to make sweeping reflections on the ability of surveyors to prepare housing schemes, but when surveyors with much greater reason object to architects lecturing them on the laying-out and making of roads, they are told that they are stirring up evil passions, and are unfair. I may have been mistaken in imagining that the large-scale contour and rainfall plan was intended to assist water engineers; but I certainly gathered that was the intention from the statements made at the Exhibition meeting. The scale, too, may be wrong, and it was possibly only a sketch plan, with no pretentions to accuracy either of scale or levels, for I can hardly understand how it was possible for a body of men unfit to revise an ordnance plan being able to do the levelling required for a reliable contour plan.

One need not necessarily be colour-blind because one is unable to distinguish readily twenty or more different tones of colour on a single plan, but I think I am entitled to suggest that the plan in question would be at least equally intelligible to the colour-blind man and the architect or engineer in full possession of his colour sense. As Professor Abercrombie admitted at the meeting that it would have been better to give this information on a larger number of plans (so as to avoid confusion), it is hardly playing the game, after holding up his hands at the meeting, now to attempt sniping in your columns.

I presume I ought to feel flattered at Professor Abercrombie wishing to know my name, and, personally, I have no objection to his doing so; but, as a matter of journalistic etiquette, he must know that it is an unusual thing to ask, and that I am compelled still to sign myself.—Yours, &c.,

THE WRITER OF THE TOWN-PLANNING ARTICLE.

March 5th, 1917.

VENTILATION SHAFTS ON PRIVATE HOUSE DRAINS.

To the Editor of THE SURVEYOR.

SIR,—Your correspondent's letter in THE SURVEYOR of 23rd February must have afforded Mr. Smith a good deal of amusement. The cheap criticism indulged in by Mr. Negus at the commencement compels one to think that his subsequent remarks were not meant to be taken seriously, and if this be the case, the criticisms offered are not calculated to be very helpful.

Having been connected with the practical work of the drainage of these houses, I have more than a passing interest in the letter, and suggestions made by your correspondent. The "pretty illustrations" were, I presume, given with the object of conveying a complete idea of the arrangement without unduly lengthening the accompanying letterpress, and in this were eminently successful.

I have very carefully compared the suggestions made, and might mention that it is within my knowledge that before the final arrangement was adopted most of these suggestions were fully considered. There are several "abominations" which I feel sure would not be tolerated by any sanitary expert. I will mention two.

(1) The suggestion to utilise a rain-water conductor as a vent-shaft is too ridiculous for words, especially so in the case of the houses in question, where the rhone crosses the dormer windows of the upper storey. I know of hundreds of cases where the by-laws read that all vent-shafts must be carried at least 3 ft. above the eaves, or 3 ft. above the highest opening in any wall.

(2) An open channel 5 ft. in length to take the sink and bath water would soon become a nuisance, a receptacle for grease, and an attraction for flies. "Convey the stuff away from the house as soon as you can" is even a sounder axiom than the one given by Mr. Negus.

It was unfortunate that space did not permit you, Mr. Editor, to publish the back elevation which I understand was sent with Mr. Smith's original article, for it would have demonstrated to Mr. Negus the impracticability of some of his suggestions.

The objection to joint drains in this case does not apply, for all the houses now being erected (and they will be counted in thousands) are the property of one owner—the Scottish National Housing Company—which fact was mentioned by Mr. Smith.

The reason for the adoption of the system under discussion was one of expense combined with efficiency, and I venture to say that at least one suggestion of Mr. Negus would be a great deal more costly. The length of piping from the house to the fresh-air inlet is so short that there is hardly any chance of foul air accumulating. Over 100 houses have been occupied since May, 1916, and after the experience of these months I can assure Mr. Negus that his fears as to foul emanations being carried are quite groundless.—Yours, &c.,

ROSYTH.

March 3rd, 1917.

The Summer Time Act.

ECONOMIES IN ARTIFICIAL LIGHT AND FUEL.

The report of the committee appointed by the late Home Secretary to inquire into the results of the Summer Time Act, 1916, and to consider whether it is advisable to reintroduce the system, was issued on Monday.

Its first conclusion of the committee is that, on consideration of the evidence as a whole, they "can unhesitatingly say that the vast preponderance of opinion throughout Great Britain is enthusiastically in favour of Summer Time, and of its renewal not only as a war measure, but as a permanent institution." They accordingly recommend that Summer Time should be reintroduced in 1917 and in subsequent years. They also propose:—

(1) That the period of the operation of Summer Time should be from the second Sunday in April to the third Sunday in September.

(2) That the change should be made on the night of Saturday and Sunday, and the reversion to normal time on the night of Sunday and Monday.

(3) That the variation should be one hour throughout the whole period.

In their review of the evidence, the committee several times point out the difficulty of arriving at definite conclusions with regard to the effect of the Act, having regard to the abnormal conditions arising out of the war, but under each head of their inquiry they indicate a consensus of favourable opinion.

With regard to the effect upon public health, they say that the general medical opinion communicated to them is that the extra hour in the open-air must have proved beneficial to the health of those who enjoyed it; although, at the moment, no particular facts and figures could be adduced in support of the statement. The police authorities have been the main source of information in regard to the effects of the Act on public morals and order, and there was a consensus of opinion among them that the operation of the Act resulted in a definite improvement. "The tendency throughout the country to spend the extra hour of daylight in the evenings out of doors is said of itself to have made for an improvement in the general moral tone." The committee have "evidence from all sources of the value of the extra daylight to the very large number of workers who cultivate gardens and allotments."

Extensive inquiries were made among gas and electric light undertakings as to the economies in artificial light and fuel effected during the Summer Time period, but great difficulty was experienced in obtaining definite information. Overtime and night work in industrial districts, and, on the other hand, the lighting restrictions, made the conditions quite exceptional; but the committee say it is nevertheless perfectly clear that the substitution of an hour's daylight in the evening for an hour's artificial light must have resulted in a considerable net saving.

ELECTRIC LIGHT.

Replies were received from over eighty municipal electric light undertakings, from between fifty and sixty private companies, and from eleven electric power companies. The estimates of the reduction in the consumption of electric light vary very widely, from 1·25 per cent in one case to 55 per cent in another.

The returns from the power companies give a mean reduction of 20 per cent for lighting purposes, thirty-eight private companies furnished figures which give an estimate of reduction varying from 10 to 41 per cent, the mean of the thirty-eight being 23 per cent, and sixty-four municipal undertakings give a mean reduction of 15·5 per cent in units used for lighting.

It would appear, the committee observe, "that the estimates of the saving in coal and the reduction in expenditure on artificial light are largely calculated on the basis of the estimate of the reduction in the consumption of units, and are therefore subject to exactly the same criticisms as that figure. Further, so far as the saving in coal is concerned, it is pointed out in many cases that the falling off in the quality of the coal supplied last year as compared with previous years increased the difficulty of arriving at an accurate figure. Our returns, however, show clearly that the saving in coal throughout the country must have been considerable. One point should be made clear in this connection—viz., that, although in some few cases there may be a reduction in the consumption of coal more or less proportionate to the reduction in the consumption of artificial light in other cases (*e.g.*, in the case of companies which supply a considerable amount of electricity for power purposes), the saving in coal may be trifling. As the plant has to be kept in readiness to supply the maximum demand and the consumption of coal for 'standby' is an important factor in the total consumption, particularly in summer time, when although boiler and electric pressure have to be maintained throughout the twenty-four hours, the actual lighting hours are very few."

An interesting calculation as to the three main sections of our inquiries was placed before the committee by Mr. Faraday Proctor, the hon. secretary of the Incorporated Municipal Electrical Association. In his calculation Mr. Proctor assumed as his basis that the Summer Time period would extend from the beginning of April to the end of September. The following are his words:—

"The lighting consumption in the six winter months may be taken on the average as being twice that of the six summer months. If, therefore, the diminution in consumption is taken at from 5 per cent to 25 per cent for the summer months, this corresponds to a diminution of from 1·7 to 8·3 per cent of the lighting consumption for the whole year. I have extracted data from the copies of the annual accounts of all those municipalities who show the output from lighting as distinct from the output for power and other purposes, and the same indicates that the total number of units sold is 4·37 times the number sold for lighting only, that is to say, the lighting units are 22·883 per cent of the total units output. The figures I have extracted relate to undertakings representing about 25 per cent of the total output by municipalities or about 17½ per cent of the total output by municipalities plus companies as returned in Garcke's Manual, and may, I think, therefore be taken as representing a reasonable average, and if these figures are accepted, then the diminution in the consumption due to the Summer Time Act would represent from ·39 per cent to 1·9 per cent of the total units sold per annum for all purposes throughout the kingdom.

"The total units sold for all purposes by municipalities and companies is about 2,000 millions per annum. At 3½ lb. of coal per unit sold this would represent a consumption of 3,125,000 tons of coal per annum. At 4½ lb. of coal per unit sold this would represent a consumption of 4,017,000 tons of coal per annum. [Mr. Proctor considered this to be the most reasonable figure to take as an average. The figure varied—in Bristol it was 4½ lb., in Manchester 3½ lb., but in other places it would be considerably higher.] At 5½ lb. of coal per unit sold this would represent a consumption of 4,910,000 tons of coal per annum.

"Owing to the standing charges, a diminution of the units sold does not result in a corresponding diminution in the coal bill. I estimate in my own undertaking, which may perhaps be taken as an average, that the diminution in the output would result in a saving of only 66 per cent of a corresponding diminution in the coal bill. Therefore, if the total units sold are reduced by from ·39 per cent to 1·9 per cent, the coal bill would be reduced by, say, 66 per cent of this—viz., by from ·2574 per cent to 1·254 per cent—and on the table of coal consumptions above given the resultant saving in coal throughout the kingdom, in respect of the supplies afforded by municipalities and companies, would be as shown in the table on p. 259.

"With such widely divergent views as to the percentage reduction in the consumption of electricity for lighting, it is difficult, and perhaps presumptuous, for me to suggest what percentage figure should be accepted, but I should say that one should not look to the saving in coal exceeding from 10,000 to 20,000 tons per annum as directly attributable to the variation of one hour per day Summer Time for a period of six summer months. If the lighting units are as

mentioned above, 22·883 per cent of the total units, the total lighting units per annum would approximate 457,660,000. A reduction of 1·7 per cent in the lighting units will amount to 7,780,000 units per annum. A reduction of 8·3 per cent in the lighting units will amount to 37,980,000 units per annum.

"The average revenue from lighting is about 2·7d. per unit, and therefore the loss in gross revenue to electrical undertakers and the saving in expenditure by consumers would approximate in the case of the lower estimate to £87,520, and in the case of the higher estimate to £427,290."

INCREASED CHARGES.

The committee also addressed to electric light concerns a question as to whether the charge for light had been increased during the Summer Time period, and they found that such had been the case with a very considerable proportion of the undertakings. This was so with about 30 per cent of the municipalities, and nearly 50 per cent of the private companies who replied to the circulars. In many cases, however, it was pointed out that the increase had been decided upon before the Summer Time Act came into operation, and was due to other causes, such as the increase in the price of coal and the cost of labour and stores; while in the other cases, almost without exception it is stated that the increase last year was only partly due to the Act. It is frequently pointed out that an increase in charges will probably be necessary in future years if Summer Time is renewed, more particularly in the case of the smaller concerns where lighting forms the most important part of the business.

GAS.

Replies were received from eighty-five gas undertakings, the majority of whom gave figures, though many emphasised the difficulty of arriving at even approximate estimates of the kind required. In addition to the influence of the lighting restrictions and of the other factors already mentioned, there was, in the case of the gas undertakings, the further complication of a very large increase since the summer of 1915 in the quantity of gas supplied (1) to private houses, for heating and cooking purposes in the place of coal, and (2) in industrial districts, to munition and other factories for power, resulting, in the case of a considerable number of undertakings, in a substantial increase in the total output of gas over the Summer Time period as compared with 1915. It appears that the nature of the records kept by the majority of the undertakings did not permit of their being readily sifted for the purpose of arriving at the estimate asked for, particularly with the limited time and staff at the disposal of the management. Accordingly, as in the case of the estimates from the electricity concerns, there was a considerable diversity in the methods of calculation employed. In many instances it was not indicated what had been the basis of reckoning.

The estimates of the percentage of reduction in consumption of gas for lighting purposes varied from 2 per cent to 26 per cent. The mean—not, the committee points out, a very valuable figure in the circumstances—works out at about 9 per cent.

Mr. Hanbury Thomas, of the Sheffield United Gas Company, has suggested that a general estimate for the whole country can be arrived at from the figures of actual saving in coal given in the replies from those undertakings who use coal and no other fuel, on the following plan: The amount of coal stated by such undertakings (twenty-eight in number) to have been saved as a direct result of Summer Time works out in the aggregate at 1·449 per cent of the total annual quantity carbonised by them. The total quantity of coal used by all gas undertakings in the United Kingdom in 1915 was, in round figures, 18,000,000 tons. Reckoning 1·449 per cent of these figures, therefore, the saving in coal effected by gas undertakings in the United Kingdom as a result of the four and a-half months of Summer Time may be put at about 260,000 tons. Further, applying the same percentage to the total annual sum spent by consumers on gas (reckoned on the total annual sales of gas undertakings,* at 3s. per 1,000 cub. ft.) the saving in expenditure to consumers works out at about £475,000.

"These estimates cannot, of course," the committee observe, "be regarded as anything but conjectural; but they represent the best that can be done with the figures, and are not perhaps very far wide of the mark."

The report adds that there must also have been a very considerable saving in the quantity of oil used by those gas undertakings which manufacture water-gas, but, unfortunately, the committee have not sufficient data to make it possible to form an estimate.

ILLUMINATING OILS.

Mr. E. Houghton Fry, the secretary of the Committee for the Regulation of Petroleum Supplies, supplied the committee with a report as to the effects of Summer Time on the consumption of illuminating oils in this country. Mr. Fry estimates that the economy effected by the Summer Time Act in the consumption of these oils amounts to about 2¼ per cent of the consumption for the year—*i.e.*, approximately 11,500 tons. Mr. Fry adds—"This seems a very modest proportion, but it should be remembered that 11,500 tons represents two journeys by an oil-tanker, which would occupy approximately four months, and this saving therefore can by no means be regarded as negligible. In fact, owing to the shortage that is at present being experienced in these vessels, the result is a very welcome one."

IRISH OPINION DIVIDED.

The committee found that Irish opinion is divided on the question of Summer Time. It was clear from the evidence that the benefits of the Act were thoroughly appreciated and enjoyed by the very large majority of town dwellers in Ireland, and in particular by those engaged in trade, business, or industry, both employers and workers. On the other hand, it was also clear that, while farmers are by no means unanimous on the question, the bulk of agricultural opinion is unfavourable to Summer Time.

TOTAL ANNUAL COAL CONSUMPTION, AND SAVING IN SAME DUE TO SUMMER TIME ACT ON LOW, MEAN, AND HIGH ESTIMATES.

Estimate.		Low.	High.	
	Reduction in lighting units:—	5	25	(Summer period only.)
	Total coal for light and power ...	Saving ·2574	Saving 1·254	Per annum.
Low	3,125,000 tons	8,043 tons	39,187 tons	,,
Mean	4,017,060 ,, ...	10,340 ,,	50,370 ,,	,,
High	4,910,000 ,, ...	12,640 ,,	61,570 ,,	,,

Waterproof Walls.—There are two methods of constructing houses with dry external walls. One is to form a cavity in the wall, and the other is to build a solid wall and then render it with waterproofed cement. It has been proved in practice (writes a correspondent) that the latter, in addition to being the surer way, is also the more economical. In a recent town-planning scheme at Bradford, Yorks, the houses were built with solid walls and rough-casted with Pudlocd cement, and the result has proved satisfactory.

The Metric System.—On the 1st inst., in the House of Commons, Mr. Bonar Law stated, in reply to a question, that, in view of the fact that the Committee on Commercial and Industrial Policy after the War is already considering the proposals which have been made for the adoption of the metric system in this country, he does not think that any useful purpose would be served by the appointment at the present time of a Select Committee to consider how the system can best be applied within the Empire.

* According to the Board of Trade returns for 1913, plus 6 per cent, which Mr. Hanbury Thomas thinks might be added to represent the increased consumption since that year.

Cultivation of Lands Order, 1916.

By REGINALD BROWN, Surveyor to the Southall-Norwood Urban District Council.

Many surveyors to local authorities have had a good deal of work placed upon their shoulders since the steps to carrying out the provisions of the above Order. The writer has taken a leading part in the work in the district of Southall-Norwood, and by reason of this he can appreciate the huge amount of labour which has been, and still remains, necessary to secure good results. When the Order came it, have the council of his district passed a resolution to leave the whole matter of securing land and the purchase and sale of the necessary seed, &c., in the writer's hands. The real reason is best known to the council he has the honour of serving, but probably it was because of the writer's intimate connection with the cultivation of land as president of several societies. The writer appreciates the confidence of his council, and these articles have been written to show what can be done with the exercise of energy and perseverance on the part of public officials. The writer, however, does not claim to have done more than many of his colleagues in other towns, probably he has fallen short in his endeavours, but he has done his best to carry out the spirit of the Order—to get as much land under cultivation as possible.

Agriculture is once again coming into its own. It behoves the people of these isles to be more reliant on themselves in the future than they have been in the past, and it is hoped that the steps now being taken through the Board of Agriculture will be lasting, and will prove to the people the importance of seeing that every square yard of land shall bear its full quota of food instead of permitting it to be half utilised. Thousands upon thousands of acres of good land, even now, are yearning for the plough, spade or fork, but from want of organisation and some sort of driving power from a central authority cultivation of land up and down the country has never been carried out to its fullest capacity.

The Example of other Countries.

In almost every country besides "free" England the Central Department would have some sort of voice in what should and should not be produced on the land. We in England dread the word "compulsion," for there is always a section of the community which, although loudly decrying compulsion, by their very actions causes "compulsion" to be brought in. It is pleasant to think that the majority of landowners do carry out their responsibilities in a proper manner, but a minority compels the bringing into force of measures which hurt the feelings of good landowners, and all have to suffer because of the wilfulness of the few. Why, even the Cultivation of Lands Order was necessary to compel the bringing into cultivation of large tracts of land within and in the vicinity of urban areas, which may be lying idle for years, and producing neither agricultural food, only bad odours, miasma, and rubbish. Up to the present eight of have been necessary.

It must not, however, be forgotten that it is not all the fault of the owners, some of it is due to the want of appreciation by the higher authorities of the necessities of food production, and possibly to the difficulties created by statute in the vacation of land [illegible] and other reasons which need not be detailed here.

The interest in land cultivation at the present time is due to the realisation of the necessity of producing more food crops, and this has come about through the energetic action of the Board of Agriculture. This Board sees the necessity of growing potatoes, and to my mind, potatoes are grown. It seems very feebly that the people want a lead [illegible] what to grow, give them facilities to [illegible] grant them protection in a form which varies according to circumstances, and we shall have no more a food shortage at least from the point of food which can be grown within the confines of these islands. We are not yet wholly "a people of the town."

Food Requirements' Details.

Agriculture is once coming into its own. How has it fared in the past? Look at the many things which might have been produced out of the land if only sufficient encouragement had been provided; if only a lead had been given; if there had been some sort of direction from the central authority—a direction which might have been conveyed in a friendly suggestion with the power to enforce if needs be this power only to be used where there was a flagrant disregard of the necessity of the people; and who *should* know better as to what the country needs than those Departments which exist, or should exist, for the very purpose of keeping their fingers on the throbbing pulse of the requirements of the people in the matter of food.

Take one illustration only: If the country needs the production of beet for sugar, ought it to be left to the whim and fancy of individuals to plant or not just as they think fit? Think you such would be permitted in any highly-organised country. Not a bit of it. If beet was necessary to be grown for the people then the Government would see that beet was produced. And by what means? First of all, education as to how beet should be grown; agricultural professors would have stumped the country, carrying with them Government authority; full notice would have preceded their visits to all districts, and cultivators of land would have had public intimation that they were *expected* to attend the lectures to be given by the professors, so as to learn how to grow beet to the best advantage, and not only how to grow beet, but also the after-treatment thereof. The farmers would be told what the Government expected of each of them, and what proportion of beet they should grow according to their holding.

I, for one, cannot but believe that this would be quite sufficient for "good" Britishers, but to urge on the "slackers" it would be necessary one is bound to confess, probably with regret, that some statutory powers would be needed—the Government would say in effect to a holder of land: "Are you growing beet in accordance with the suggestions made? If not, why not?" And very good cause would have to be shown for farmers to escape the effect of their neglect. But such powers—in England—would, it is certain, be seldom exercised, because farmers would rise to the occasion. Sugar beet is only given as an illustration. The point is, say what is wanted and we shall get it; and, no doubt, without compulsion.

(To be continued.)

MR. PROTHERO'S CIRCULAR TO LOCAL AUTHORITIES.

In reference to the extended powers granted to local authorities under the Cultivation of Lands Order to enter on any land, whether occupied or unoccupied, without the owner's or occupier's consent, Mr. Prothero notifies local authorities that these should be exercised with the greatest possible care and discretion, and should not be used to interfere with land which is already being fully cultivated, or with meadow or pasture land of good quality, the breaking up of which would involve considerable expenditure on restoration on the termination of the occupation.

In view of the urgent importance of maintaining the milk supply, no land should be taken which is being used for the grazing of cows, or which is otherwise essential for dairy purposes.

The local authority will still require the further consent of the Board for entry on common land, and it may not enter on any garden or pleasure ground occupied, or usually occupied, with a dwelling-house.

Mr. Prothero does not think that public recreation grounds, in populated areas, which are turfed and are used to any substantial extent for recreation, can with advantage be broken up, but there is much public land which does not fall within this category.

A report on the cultivation of parks and open spaces was presented by the Parks and Small Holdings Committee at Tuesday's meeting of the London County Council. The committee recommended that in districts in which the Council is unable otherwise to secure land under the Cultivation of Lands Order, 1917 (No. 2), to satisfy applicants for allot-

The Lady and the War-time Dustmen.—While we are in the midst of a gigantic war (says a writer in the *Bristol Times and Mirror*) people cannot expect the conditions of life, nor even the arrangements made for our comfort by the Bristol City Fathers, to continue to run like clockwork. A point which arose at the local tribunal, when the Bristol Sanitary Authority presented certain claims, leads us to make this remark. The city engineer (Mr. L. S. McKenzie) has acted admirably in giving up men for the King's service, as the proceedings before the tribunal showed. Half the ashmen are now "strappers," and the circumstance that they have not been trained in deportment and Johnsonian English has apparently vexed a certain lady. At any rate, she wrote to the city engineer complaining of the men, and stating that they cannot speak the King's English! The city engineer has replied to the letter explaining, with all politeness, that he does not guarantee that all the ashmen he engages shall have had a college education. We suggest that when National Service is fully developed he may possibly be able to find an old University man willing to remove ashes rather than be accounted a shirker. That suggestion, too, for the consolation of the lady.

New Baths at Glasgow.—The opening took place last week of new swimming baths and a wash-house which have been provided for the district of Govan-hill by the Glasgow Corporation. The site of the buildings covers an area of 3,455 sq. yds. The frontages to two streets are built of stone, and the other walls are of brick; the walls inside are tiled; the floors of bath and pond rooms are of terrazzo, and the floors of the hot rooms are of tiles. There are two swimming ponds and a "learners'" pond, with hot and cold sprays, foot baths, &c., in each pond room; a Turkish bath with three hot rooms, a Russian bath, a shampooing room with two marble slabs, a cold plunge bath, and a cooling room with twenty beds. The water in the ponds is heated by the exhaust steam from a pump which is used for drawing the water continuously from the ponds, and is worked in connection with the filtration and aëration plant. There is an arrangement for mixing salt connected with this plant so that salt-water baths can be had. Ferro-concrete has been extensively used in the construction of the buildings. The public wash-house is fitted with sixty-eight wash stalls, and space has been reserved for a further fourteen. The cost of the establishment was about £35,000, exclusive of the price of the ground.

SCOTTISH NOTES.

[In the hope of making these notes as practically useful as possible the writer invites readers to favour him with communications thereon from time to time. They might be constructively critical, or helpfully supplementary, might indicate new points upon which information is desired, or might merely convey information. Communications will reach the writer if addressed "Scottish Notes," 24 Bride-lane, Fleet-street, E.C.]

Scottish Housing Council. At the meeting of the National Housing and Town Planning Council, held in Glasgow in November last, a Scottish Committee was appointed to work in co-operation with the National Council, and to represent local authorities and other interests involved, in view of the importance of public opinion being educated on the subject of housing and town planning, in order that the interests of Scotland should be adequately safeguarded. This committee has now got to work, and at its first meeting, held in Edinburgh on February 13th, under the chairmanship of Sir Thos. Hunter, the town clerk of Edinburgh, very good progress was made.

* * * *

Town-planning conferences have, in the opinion of many, degenerated—there has been plenty of talk, but no practical results. The Scottish Committee do not wish to have any such charge laid to their door. Three sub-committees have been appointed, and to these have been remitted the duty (1) of framing a policy of general action; (2) of guiding the committee in all matters technical; and (3) of arranging for impressing on Parliament, by deputation or otherwise, the need for immediate action to make good the demand for housing accommodation.

* * * *

The Need for Housing. The demand for additional housing accommodation is real and urgent, and local authorities or other agencies must be prepared to face the erection of fully 40,000 dwellings immediately the war is over. That Parliament must contribute towards the cost of such an enormous building project is undeniable, but it is to be hoped that the contribution will be on strict business lines.

* * * *

In this connection the pending report of the Royal Commission on Housing in Scotland will be of very great interest. Not only will it verify facts as to shortage of housing accommodation, but it is expected to give a lead as to the financial arrangements.

* * * *

"No Interest" Loans. Of late there has been a considerable cry for "no interest" loans for housing purposes. The writer considers the success of any such movement as fatal to all true progress. Housing schemes should be such that the rents charged should meet all the charges which have to be met in providing the houses. The better for the nation it will be when each industry recognises the necessity for its being self-supporting in the sense that the workmen engaged in it should be paid such wages as will enable them to provide the necessities of life, including proper housing accommodation.

* * * *

The problem of the very poor is one of difficulty, and any policy of housing for such must of necessity be State-aided. It will tax the wisdom of the best of our housing reformers to find a solution satisfactory to all the interests involved.

* * * *

The Problem of Housing Generally. The whole question of housing presents a difficult problem—its aspects are so varied. There is the housing problem of the city, the housing problem of the mining area, the special industrial area, and the rural area. The first appeals practically to every local authority, and presents the fewest difficulties, but when we come to the mining and special industrial areas, the question at once arises, Who is responsible? Is the mine-owner, the steel smelter, or the manufacturer, whose enterprise has brought the workers together and hence caused the need for houses to be required to provide the necessary accommodation? And what is to be the standard demanded? Or is the local authority to be

required to provide the housing? If the last named, what is to be the attitude of the general ratepayer to such a policy? Again, as regards rural conditions, many landowners have done their duty faithfully, and beautiful, healthful villages are to be found on many estates. But what of the owner who has not fulfilled his duty? Is the local authority or the State to relieve him of his obligations? The writer merely suggests the difficulties, and trusts that others interested may continue the discussion.

* * * *

Vote of Confidence in an Official.

The writer wishes to take this opportunity of congratulating Mr. Wm. Watson, the burgh surveyor of St. Andrews, on the vote of confidence he received from his town council recently. For some considerable time certain members of the town council have overstepped all limits in their criticism of Mr. Watson's work, and on Mr. Watson being asked some time ago to undertake work of national importance for a Government department, which involved his presence in Edinburgh for four days per week, they seemed to find their chance to move that his services be dispensed with. Fortunately, however, the other members of the council had other ideas of Mr. Watson's worth, and the heartiness of their expressions of appreciation should go a long way to silence the critics and to strengthen the hands of Mr. Watson.

* * * *

No official is against just and honest criticism of his work. The best is not free from mistakes, and intelligent and sympathetic criticism should never be resented, but when one finds councillors using their public positions as an avenue for their personal spleen, the matter calls for protest. Mr. Watson's friends trust that he has heard the last of this unpleasant matter.

OFFICIALS ON ACTIVE SERVICE.

A QUESTION OF PRINCIPLE.

At last Friday's meeting of the Metropolitan Water Board an interesting report dealing with the position of officials serving with the forces was presented by the General Purposes Committee in proposing a number of increases of salary.

The committee stated that they had had no difficulty in adopting the view that where an officer on active service was in a class carrying automatic scale increments, he should continue to receive those increments, subject to the usual certificate of good behaviour. Where, however, an officer on active service was at the head of a class, and the point, therefore, was one of promotion to the next class, a question of principle arose which called for careful consideration.

"On August 4, 1914," the committee pointed out, "the board passed a resolution giving leave of absence to officers and servants during naval or military service, and undertook to reinstate them on their return with no loss of 'position' or 'emoluments' consequent on enforced absence. This resolution related in the first instance to men who were mobilised or embodied on the outbreak of war, but was extended to those who voluntarily joined the Forces.

"It will be seen that the reinstatement without loss of position or emoluments is to occur on the man's return to civil duty. On this it has been argued that the board would fulfil their promise if all promotion or increase of pay were withheld until such return, the man then being placed in the position he would have occupied had he not gone to the Army.

"At first sight this contention seems reasonable; but a close examination reveals circumstances which call for consideration. As an illustration we take the case of two men who at the outbreak of war were in identical positions in the board's service. One of them joins the Army, the other is medically rejected. The latter gained retains in civil employment and obtains such promotions and increased increments as would be given in the ordinary course of business. His remuneration of salary come to him year by year, and he has the opportunity of investing them or otherwise putting them to good use as and when received. Then taking a period of, say, three years with £20 increments, he would have enjoyed by way of increased emoluments:—

First increment for three years ...	...	£60
Second increment for two years	...	40
Third increment for one year ...	...	20
		£120

"As against this, the man on military service, though receiving £120 on his return to civil duty, would have been deprived of the use and enjoyment of that sum during the period of his military service, when it would have been valuable for investment or the support of dependants.
